A

Australia

Overview of Country

Australia is the sixth-largest country in the world, covering 4.6 million square miles (12 million sq. km). It is surrounded by water and has a desert landmass in the middle. The island continent was inhabited by Aboriginal Australians for more than 50,000 years before it became a settler territory. The vast resources opened opportunities to millions of European migrants. The land that was called *terra nullius* by British colonizers in 1788 became home to mostly Irish and Scottish convicts, penal officers, and colonial bureaucrats and their families. Most convicts entered Australia through a penal station in Port Arthur, Tasmania, then eventually spread to New South Wales, Western Australia, Queensland, and minimally to Victoria. By the 1850s, with roughly 1 million people in the territory, Australia stopped receiving convicts from the United Kingdom. Docklands and port towns such as Sydney, Melbourne, Fremantle, Brisbane, Townsville, and Cairns were quickly populated and consequently expanded due to commercial shipping and trading companies (ABS 2014a). The arrival of free settlers later deepened the colonization of the island continent, but the central, northern, and northwestern parts of Australia remained home to Aboriginal Australians, even after dispossession.

Australia is a constitutional monarchy with Queen Elizabeth II as head of state and powers and procedures guided by a constitution. There are seven states with the seat of government situated in the Australian Capital Territory (ACT). As a federal system, Australia is headed by a prime minister, and the Parliament is composed of 150 members of the House of Representatives and 76 members of the Senate.

Australia has a capitalist economy with a strong tradition of welfare statism. It is a member country of the Organization for Economic Co-operation and Development (OECD) with a consistently high per capita income growth: USD\$35,000 in 1999 that increased to USD\$45,300 in 2009 (ABS 2014f). In 2014, the average weekly earnings of an adult in Australia was AUD\$1,453.90 (ABS 2014c). The high standard of living resulted in an aging population with a long life expectancy and sustained low fertility. In 1901, only 4 percent of the population was elderly; in 2011, men and women over 65 years old are 13 percent and 15 percent, respectively (ABS 2012f). In the UN Human Development Report for 2013, Australia ranked 2nd in the overall Human Development Index (HDI) worldwide (UNDP 2014). As for the Gender Inequality Index (GII), Australia is ranked 19th out of 149 countries. The country's very high GII, which is higher than the OECD average, is evidenced in all measured categories, such as life expectancy at birth, expected years of schooling, and mean years of schooling.

Stop the Boats!

This is Australia's policy on asylum seekers under the conservative of Tony Abbott. In 2014, 350,000 asylum seekers boarded in boats; a huge number of them boarded a boat in Southeast Asia. Many are Rohingya, a persecuted ethnic minority in Myanmar. People die during the long, tortuous journey: they are dehydrated, beaten up, or thrown overboard. When intercepted by Australian patrols at sea, they are returned to the country of departure, but if they managed to reach Australian territory, people are diverted to an offshore refugee processing center in the island of Nauru. This solution of the Australian government has been criticized as unlawful and has attracted much attention due to suicides and riots that ensue in the detention centers where asylum seekers are housed. Despite the strict measures to stop the boats by all means necessary, asylum seekers still take the risk and spend money on the journey to Australia to escape economic and political difficulties. Pro-refugee campaigns argue that Abbott's strategies do not mitigate the coming of the boats, but only aggravate casualties.

Australia today is known as one of the most multicultural countries in the world, attracting migrants to participate in its liberal democratic society. The high standard of living in Australia has made it one of the most attractive migration countries. Most Australians reside in the states of New South Wales (32%) and Victoria (25%) and prefer to live in capital cities (66%) (ABS 2014e). Between 1945 and 1998, 5.7 million migrants have made Australia their home (ABS 2000). As of 2014, the estimated resident population of Australia was 23.7 million (ABS 2014f). Yet, this has not always been the case in multicultural Australia. The presence of early non-European peoples from countries now known as China, India, Afghanistan, and the Pacific Islands was mostly due to labor recruitment. After the 1901 Immigration Act, nonwhite peoples were restricted from entering Australia. The restriction was lifted after 1966.

Around 2.5 percent of the population are of Aboriginal Australian and Torres Strait Islander descent (ABS 2012c). The native inhabitants of Australia are composed of many nations and cultures. Before colonization, approximately

700 languages were spoken in Australia, where 750,000 people lived. Colonization had devastating impacts, such as the introduction of diseases, deaths, poverty, and racism. The economic dispossession of Aboriginal Australians began with the seizure of Aboriginal lands that were then developed to become a prosperous pastoralist industry. Australia's leading export industries of beef, sheep, and milk products are a result of land grabbing and forced labor. Called *stockmen* and *stockwomen*, Aboriginal Australians' skills and labor were exploited by white landowners who paid them very little or counted food provisions as wages—a version of modern slavery in Australia.

Another tragedy that befell indigenous peoples was the forced separation of children from their families that lasted from the late 1800s to 1969. Approximately 100,000 children were victimized and then later called the "Stolen Generation." These children were either placed in institutions or put up for adoption, especially in the case of lighter-skinned children. This painful chapter in history, as the discussion of socioeconomic aspects of contemporary Australian life unfolds, shows enduring consequences.

Girls and Teen

In 2009, there were nearly 4 million young people aged 12–24 in Australia; 51 percent are females, and only 78 percent were born in Australia (AIHW 2011). Ensuring that these young people are healthy is part of the Australian government's social policies. Early intervention and prevention through health, education, training, sports, and skill-acquisition programs are key to making sure the youth will have a smooth transition to adulthood. The early years are a crucial time to form positive values that will turn youth into responsible citizens. Young people who study or work have lower incidence of violence, substance abuse, and accidents. Young Australians engaged in education or work leveled out for two decades: 81 percent in 1999 and 84 percent in 2008 (ABS 2010a). In 2006, 7 percent of children aged 5–14 years had worked. Typical jobs included delivering leaflets or cleaning and gardening for others. The most common job for girls was sales during school terms and holidays (ABS 2006). Among 15- to 19-year-olds, women were less likely to be in the labor force than males. Overall, young Australians have achieved minimum standards in education.

In 2012, Australian youth aged 5–17 years spent on average 1.5 hours per day watching television. Boys spent more than 30 minutes on video games, while girls spent

only 8 minutes. Both boys and girls did an average of 91 minutes of physical activity per day. Children aged 2–4 years were more active, with an average of 6 hours per day of physical activity (ABS 2013a).

However, new challenges test the social welfare that young Australians enjoy. Problems include the rising rates of diabetes and sexually transmissible diseases, alcohol- and drug-related violence, and homelessness. Also, bullying has been on the rise. It occurs due to prejudices based on differences in culture, ethnicity, age, ability or disability, religion, body size, physical appearance, personality, sexual orientation, or socioeconomic status. Bullying affects the well-being of young people and is directly linked to absenteeism in school; lower academic performance; low self-esteem; depression; health problems, including mental health issues; violence; and even suicide. Young people from low-income Aboriginal and immigrant backgrounds and LGBTQ youth are often the targets of bullying. Self-harm is also common among teenagers. Males were three times more likely to die from suicide than females. In general, young females have lower death rates than males (AIHW 2011).

Risky behaviors such as drug and alcohol intake and sexual activity have been considered part of growing up. Boys start drinking at age 15, while girls often begin at 17. Boys are two times more likely to drink alcohol and smoke than girls. Among year-12 students, 88 percent reported having experienced some form of sexual activity, with females more likely to have had sexual intercourse than males. Almost all youth reported using some form of contraception. Despite this, teenage birth rates are high, where Australia ranked 22nd out of 26 countries in the OECD (AIHW 2011). In 2013, the adolescent birth rate was at 12.1 percent, approximately half the rates of New Zealand and the OECD average (UNDP 2014). Aboriginal and Torres Strait Islander girls are five times as likely to be teen mothers compared to teenagers in other groups. Lower rates of school attendance and low-income backgrounds are often cited as reasons for this fertility trend. As for HIV cases, young males have higher rates than females, but there were twice as many females than males who reported having sexually transmitted infections (STIs) (AIHW 2011).

Education

Women's history in Australia has been fraught with challenges related to gender inequality due to Australia's masculinist, colonial, and racist past. The educational

opportunities for women reflect this history, as women register lower levels of educational attainment than men. However, women's presence in higher education has increased ever since the first Australian woman graduated from college in 1883 (ABS 1994). In the early 2000s, women are more likely than men to stay in school through grades 10–12, and graduation rates are higher for women than they are for men (ABS 2013b). Women also have higher literacy rates than men (ABS 2012a). Since 1987, women have outnumbered men in higher education (ABS 2000). Comparatively, Australia's educational attainment is slightly above the OECD average, with women performing better than men.

As for chosen vocations, women are concentrated in areas traditionally identified as feminine, such as teaching and nursing. In fact, 57 percent of higher education students in 2011 were women whose studies were focused on these professions (ABS 2012a). In 2013, a male graduate earned \$55,000, and a female graduate earned \$51,600 (ABS 2014d). This pattern between teacher education and opportunities is also reflected in the overwhelming presence of women teachers in primary and secondary schools but much less in higher learning or university positions (ABS 2012a).

Australia's diverse population also reveals patterns regarding women's educational attainment across ethnic and national backgrounds. The average female migrant from India, Malaysia, Singapore, or Hong Kong is more educated than other migrants, while Eastern European women have high rates of work participation. Northwestern European women migrants are more likely to possess high language skills, while Mediterranean women have weaker English skills and lower levels of educational attainment. The length of stay of migrant women has a strong influence on their occupational status, specifically when the acquisition of language skills is slow, such as for women from non-English-speaking countries (Evans 1984). Despite the high educational attainment of migrant women, they suffer *de-skilling*, as in the case of South Korean women, when they take up jobs for which they are overqualified because of a perceived language deficiency (Ho 2004).

Educational outcomes are also linked to socioeconomically disadvantaged backgrounds, where young people from this group underperform in literacy and numeracy and leave school early. There is also a correlation between educational outcomes and conditions specific to regional and remote areas in Australia because schools are more

expensive to maintain and quality school staff is more difficult to retain (AIHW 2011). This implies that indigenous young people—because they are from socioeconomically disadvantaged backgrounds and live in regional and remote areas—are in danger of achieving much lower educational outcomes than their nonindigenous peers.

Health

Health expenditure in Australia is slightly lower than the average in the OECD—lower as part of its gross domestic product (GDP) spending—with a modest growth in pharmaceutical spending (OECD 2014). Despite this, Australia enjoys almost two years higher life expectancy than the OECD average. Specifically, life expectancy in Australia for all women, regardless of other factors, is 84.8 years, higher than men by four and a half years in 2013 (UNDP 2014). Australian women live longer, despite registering a higher rate of psychological stress and expressing that they are always stressed for time (ABS 2014g). Women have lower rates of suicide, alcohol consumption, smoking, and drug-induced deaths (ABS 2014e). They also access Medicare services more frequently than men (ABS 2004b).

More Australian women die from breast cancer than from other forms of cancer. In 2001, more than half of the women born in Australia underwent mammogram testing every two years or more often. On the other hand, 47 percent of women from North Africa and the Middle East were the most likely to never have done so. Indigenous women are less likely to develop breast cancer than nonindigenous women; however, they have a higher rate of, and mortality rate from, cervical cancer (ABS 2004b). Having mammography and Pap smear testing is influenced by socioeconomic grouping, as women in higher income quintiles get tested more often than those in lower income groups. Also, migrant women receive lower rates of testing due to language and cultural barriers.

Australians suffer one of the highest skin cancer rates in the world. From 1982 to 2010, there was a 60 percent increase in skin cancer cases. Two out of three Australians were more likely to suffer from this disease by age 70 during those years. Despite this, the survival rate for Australians is high: 94 percent for women and 90 percent for men (Cancer Council Australia 2014).

There were 24,731 cases of HIV in Australia as of December 2011; diagnosis peaked in 1987 and was followed by a 12-year decline. The fall was due to the combination of the introduction of antiretroviral therapy (ART) and effective

First-World Country, Third-World Health

As a First-World country, Australia has a section of its population suffering from Third-World health problems—and even worse than some Third-World countries, claims a UN report on the right to health. To say that indigenous peoples in Australia are not as healthy as nonindigenous people is an understatement. Their poor health is attributed to inadequate nutrition and physical activity, tobacco use, and alcohol intake. There is a 10-year gap in life expectancy between indigenous and nonindigenous peoples. This is due to the poor government intervention to provide health care facilities and culturally appropriate services. The Australian government responded to the challenge in 2008 with the Closing the Gap initiative, aiming to equalize the opportunities for both indigenous and nonindigenous Australians by the year 2030.

safe-sex campaigns. There are more Australian men living with HIV/AIDS (38,715) than women (3,190). HIV transmission primarily occurred through men having sex with other men, at 66 percent among all Australians, compared to 25 percent for heterosexual contact. There are differences, however, regarding transmission. About 51 percent of Aboriginal and Torres Strait Islander peoples contracted HIV through men having sex with men compared to 72 percent from other groups. Likewise, transmissions due to drug use are higher among the indigenous population at 17 percent, compared to only 2 percent among nonindigenous adults (AVERT 2014). Finally, 21 percent of indigenous peoples living with HIV/AIDS are women.

Aboriginal and Torres Strait Islander peoples do not fare well on health matters compared to nonindigenous Australians. Their life expectancy is still around 10 years lower than for other Australians, despite the slight narrowing of the gap over the years. Aboriginal men and women were three times as likely to have diabetes and more than four times as likely to be in advanced stages of chronic kidney disease (ABS 2014b). Half of all Aboriginal and Torres Strait Islander peoples over 15 years of age reported a disability or long-term health problems (ABS 2012c).

Finally, high levels of psychological distress have been reported by approximately one-third of adults (ABS 2014b). This can be linked to experiences of discrimination and a history of removal from family that affects 1 in 12 Aboriginal and Torres Strait Islander peoples. In particular, Aboriginal and Torres Strait Islander women report higher levels of psychological stress. Despite these challenges, 72 percent of indigenous Australians report being happy most of the time (ABS 2011).

Fertility

Australian women are expected to manage the home, raise the children, and contribute to family income. Women's economic independence, recognition in the workplace, and the availability of health and lifestyle choices have allowed women to pursue options outside their traditional roles. The availability of contraception and their outlook on cohabitation and relationships have allowed women the ability to choose whether to have children, delay it, or not have children at all, without the enormous pressure that previous generations of women experienced. The rate of fertility in OECD countries, in general, fell over decades, from 2.6 babies per woman in 1970 to 1.6 in 2004 (ABS 2007). Childlessness has also been an option for individuals and couples, due to economic reasons or lifestyle choices. In 1986, one in five Australian women were likely not to have children, while in 2000, the rate increased to one in four women (ABS 2002).

Australia's fertility rates have been declining since the postwar baby boom. In the early 1920s, women in Australia had a fertility rate of 3.0, which decreased to 2.1 in 1934. In 1961, during the postwar baby boom, this increased to 3.5 babies per woman. The figures decreased in 1981 to 2.8 babies and then to 2.0 babies per woman in 2006 (ABS 2008a). However, since the start of year 2000, the total fertility rate in Australia has slightly increased. The changes in the rate of fertility are subject to a combination of personal demands and social factors. Women from the least economically advantaged of the population have more babies than the most advantaged. Women with no postschool qualifications were least likely to be childless compared to those with higher qualifications (ABS 2010b). As a consequence of women becoming more educated, they are more likely to defer having children by pursuing higher degrees and then starting a career. To compare, in 1979, only one in four births were registered to women aged 30 and older; however, in

1999, the proportion increased to one in two births (ABS 2001).

Australian women who live far from large population centers are likely to have more babies than those living in major cities (ABS 2010b). The high fertility rate in remote places is due to the demographic concentration of indigenous Australians in these areas who, on average, gave birth to 2.74 babies per woman in 2011, compared to 1.88 for non-Aboriginal women (ABS 2011). In terms of religion, childless women in Australia are more likely to be Buddhists or unaffiliated with a religion. On the other hand, women who identify as Muslim had more children in all age groups than women of other religious affiliations (ABS 2010b). These observations point to the interconnectedness between socioeconomic status, geography, religion, race, and fertility rate.

Comparing Australian-born women and migrant women shows that migrant women give birth to fewer babies. However, there are exceptions to this pattern. Women from Lebanon, for example, have 3.3 babies, and Polynesian women have 2.5 babies on average, higher than Australian-born women at 2.1 babies per woman. On the other hand, women from East Asia have fewer children; for instance, Chinese women have 1.5 babies per woman. The Lebanese and Polynesian country-specific cases may be related to the pattern that women born in

Deaths in Custody

Deaths while in police, prison, and immigration custody are rising. In 2013, 44 people died while under custody. This is a problem in Australia that has been identified since 1991 by the Royal Commission into Aboriginal Deaths in Custody after 99 Aboriginal and Torres Strait Islanders died while in police custody between 1980 and 1989. The high representation of indigenous Australians in custody and the number of deaths are high, and thus the community has launched campaigns in different Australian states to promote and defend the human rights of prisoners. Many Australians presume that the problem lies in structural racism against indigenous Australians. "The beginning of the cause of deaths in custody does not occur within the confines of police and prison cells or in the minds of the victims. Initially it starts in the minds of those who allow it to happen," says Aboriginal elder Jack Davis.

non-English-speaking countries had a lower level of oral contraceptive use; however, the Chinese case does not (ABS 2008a).

On the subject of maternal health, 76 percent of all Aboriginal and Torres Strait Islander children had been breastfed; those living in remote areas were breastfed longer than those in nonremote areas (ABS 2012d). Comparatively, across all groups in Australia in 2012, only 39 percent were breastfed exclusively in the recommended first four months (ABS 2012d).

Employment

Australian women's participation in the labor force has been steadily increasing in the last 40 years. Because Australia had experienced a "feminization" of the population since 1901, it has been strategic to set up structures that encourage a more equitable work balance (Opeskin and Kippen 2012). Reducing gender inequality in education, employment, and business opportunities is not only necessary for social justice but also for economic reasons. Greater participation of women will increase labor productivity, innovation, and competitiveness. Also, greater labor participation reduces the risk of poverty for women and their families and lessens the incidence of poverty in old age that is higher for women than men (OECD 2011). However, while access to income may give women economic independence, self-fulfillment, and social recognition, women still have to face the problem of balancing the demands of career and family life.

One of the reasons why opportunities for women are fewer is because of the continued understanding that a woman's place is at home as wife and mother. Women perform unpaid work as familial service rendered within the private sphere. Because work rendered at home is not for sale in the market, women's reproductive labor is seen as secondary. Although everyday life would be difficult without the unpaid domestic work that many women do, it is not seen as economically productive. Overall, although Australian women have gone into the labor force—65 percent of them work compared to 78 percent of men—they are still the main providers of unpaid labor in the home. On average, women put in 8 hours and 33 minutes per day to household labor, while men contribute 3 hours and 55 minutes of their time. There is also the overwhelming presence of women in private care work for the disabled. Women are more than twice as likely as men to care for persons with disabilities (ABS 2014e).

The question of inequality in paid work is a battle that is still being fought in Australia. Males earn more on average based on weekly time earnings in every major occupation. Figures show the symptoms of the imbalance; for example, men receive \$35.40 per hour for nonmanagerial positions, while women are paid \$31.20 for the same work (ABS 2014e). Women receive less on all incomes earned both by men and women, 31 percent in 1982 and 38 percent in 2006, indicating a slight increase within a 25-year gap (ABS 2008). A gender-based income gap is also reflected in the rate of women living in low economic situations compared to men, 20.1 percent versus 18.6 percent, respectively (ABS 2014e).

Two-thirds of immigrants to Australia work in jobs relevant to their qualifications. Given that Australia's immigration policy favors skilled migration, it is not surprising that 69 percent of the 3.8 million migrants as of 2011 have qualifications gained abroad. This figure is higher than Australia's average of 62 percent. A more educated cohort of migrants has the trend. The number of bachelor's degree holders rose from 15 percent (arrivals before 1996) to 46 percent (arrivals after 2006) (ABS 2012e).

Parental Leave

Australian parents enjoy paid leave after the birth of a child. In 2011, the government enforced the Paid Parental Leave plan for eligible working parents. Employees who have worked for at least 12 months of continuous service in most cases can avail such privilege through workplace agreements and industrial awards. The Maternity Leave Act for civil servants has been in place since 1973. There are more than twice as many female public-sector employees compared to female private-sector employees who get leave entitlements (ABS 2013e). In 2007, 1.8 million women, or 45 percent of the 4 million female workers in Australia, were entitled to paid maternity leave (ABS 2013e). On the other hand, 1.5 million, or 39 percent of all female workers, did not receive paid maternity leave (ABS 2013e). Seventy percent of them were part-time employees. The amount of earnings of a worker has a direct correlation with maternity leave entitlement. Women with higher income get maternity leave at higher rates than women with lower income (ABS 2013e). Fathers and partners have had access to paternity leave or flexible work arrangements; however, these practices are not as common as women who take maternity leave (ABS 2013e).

Housing

In Australia, there is a big gap between Aboriginal and Torres Strait Islander peoples and other groups when it comes to access to housing. In 2011, 59 percent of them rent their accommodation, while only 29 percent of non-Aboriginal and Torres Strait Islander peoples rent. Moreover, only 11 percent of Aboriginal and Torres Strait Islander peoples own their homes, compared to 68 percent for other group (ABS 2012b). In particular, 6 percent of Aboriginal and Torres Strait Islander peoples live in multifamily households, compared to 2 percent from other groups. There are much fewer one-person households, too, because 81 percent of Aboriginal and Torres Strait Islander peoples are family households with an average of 3.3 persons per household.

Young people who live in overcrowded dwellings are more likely to experience health problems than those who do not. Lack of space can have a negative impact on young people's sense of autonomy, social behavior, health, development, and academic performance. Indigenous young people are three times as likely to live in overcrowded dwellings (AIHW 2011).

Family Life

Family formation through international marriages in Australia has had a long history because the country is a destination for citizens of the United Kingdom. There are also many partnerships between Australian men and Aboriginal

women as well as mass migration from other countries of the world. From 1974 to 1998, the proportion of heterosexual interracial and intercultural marriages has consistently increased. In 1974, the percentage of mixed marriages was 39 percent, and this rose to 52 percent in 1998. This is the opposite for Philippines-born women migrants, who have a high rate of marrying Australian men, at almost 70 percent. Migrants from Vietnam, Greece, China, Lebanon, Hong Kong, and the former Yugoslav Republic were least likely to marry longtime Australians (ABS 2000). From 2001 to 2011, Australia granted "Partner Migration" visas to 337,127 spouse and fiancé applicants and 42,288 children. Two-thirds of these applicants were female, and only 4,921 were in same-sex partnerships. During this period, the top countries of citizenship of the Partner Migration visa holders were the United Kingdom, China, India, the Philippines, Vietnam, the United States, Thailand, Lebanon, Indonesia, and Japan (Lyneham and Richards 2014). The United Kingdom has the highest number of same-sex partnership visa holders.

Same-sex family formation has also been on the rise because this union is allowed in Australia. However, the Marriage Equality Amendment Bill 2012 that will allow homosexual couples to get married has not passed in the Parliament (as of 2016). There are 33,700 same-sex couples, and 16,100 of these are in female same-sex partnerships. These couples tend to be younger than heterosexual couples and are more likely to have higher personal incomes. Common occupations among Australian lesbians and LGBTQ women include positions as general clerks, sales assistants, nurses, schoolteachers, managers, and receptionists. Only 1 in 10 same-sex couples have children in the family household. They are either from previous opposite-sex relationships or conceived through reproductive technology, adopted, or fostered. In 2011, there were 6,120 dependents under 25 years in same-sex households (ABS 2013e).

Marriage Equality

There is a growing support among Australians for the Parliament to pass the Marriage Equality Amendment Bill 2012 so that same-sex couples will be recognized in a marriage. However, the bill has not been passed, to the disappointment of Australia's LGBTQ community and its supporters among heterosexuals. Although Tony Abbott's conservative government defers the passing of the amendment, there has been a strong network of civil society actors that campaign for greater awareness of the issues among all Australians. Australian Marriage Equality (<http://www.australianmarriageequality.org>) is an online platform that explains the many issues and debunks the myths surrounding same-sex marriage.

Politics

Rights, Suffrage, and the Women's Movement

A strong component of the Australian nation-building is the myth of the "lucky country," a country blessed on abundant natural resources that can be harnessed by white settlers. This narrative includes the celebrated figures of the Australian "Lone Hand" or "Bushman," male heroes in the outback formed out of the hardened character of transported convicts. Therefore, the masculinist historicizing

Women's Voices

Margaret Cooper

Margaret Cooper (1943–), an Australian, contracted polio at age 4. By age 10, she had become an advocate for disabled persons when she protested educational inequities for disabled children. She later used her knowledge as a social worker to develop networks for disabled women, including the organizations Women with Disabilities Victoria and Women with Disabilities Australia. In 1985, Cooper and other disabled women at the Disabled Persons International meeting in the Bahamas protested to make the delegates address the particular issues facing disabled women, such as forced sterilizations, sexual violence, and inaccessible health services. During the 1970s, 1980s, and 1990s, Cooper led persons with disabilities to ensure that their needs were not omitted from the social and political agenda in Australia.

renders the issue of gender equality one of the thorniest in Australia. This means that women's role in Australian history could only be secondary at best (Lake 1997). As a result, in the writing of Australian history, women are missing as contributors to colonialism and economic development and as central figures in the formation of settler colony. At worst, women in the early period were collectively depicted as "dissipated idlers and abandoned whores," a stereotype of England's women convict transports, some of whom worked as prostitutes. However, most of these women were literate, young, healthy, and eager to learn, making them ideal migrants for the settler colony. Scholars suggest that the characterization of convict women as "drunken whores" is not only historically inaccurate but also laden with class bias (Oxley 1996). It is within this context that Australia's brand of feminism arose.

The Australian suffrage movement had been pioneering for its fast crystallization in the colonial outpost as early as the 1880s. While women's advocacy was inspired

by social movements in England, Europe, and North America, it was conditioned by the dire situations of early women settlers. The Women's Committee of the Society for the Promotion of Social Purity aimed to raise the age of consent of girls from 13 to 16 to work in brothels as prostitutes (Oxley 1996). During this period in Australia, when sex work involving very young women was legal, this campaign already constituted a radical improvement. The group was the predecessor of the Women's Suffrage League of South Australia that was instrumental in winning for white women the right to vote in 1895. Australia's history as a penal colony shaped the Australian suffrage movement along the lines of prevailing customs and laws that placed women only within allowable parameters. This tendency was largely shaped by early women activists' understanding of their political role. The empowerment of Australian women coincided with the distinctive national identity that Australians were trying to forge in the colonial period (Lake 1997). In other words, the situation was ripe for women to ride the wave of fervent nation-building to advance their causes.

The women's movement was under scrutiny, however, as positive changes in white settler women's lives were made possible at the expense of Aboriginal women, who were pushed into sexual servitude to the white male (Lake 1997). For the most part, Australian nationhood was dependent on the colonization of Aboriginal peoples. But this fraught relationship between the rise of imperial feminism and the racial oppression of others escaped critical scrutiny. The progress of the women's movement continued onward in the 1930s, when white women started to join the workforce. The years between 1920 and 1940 were an opportune time for women to participate in paid work and to take on a new identity as workers (Firth 2004). However, when men returned from military service and reclaimed the jobs that women had occupied, women were again dispossessed of this new identity. Postwar reconstruction efforts in Australia did not include a serious consideration of women's roles as laborers and breadwinners.

The 1950s and the 1960s, depicted as the return of conservatism, were barren for the Australian women's movement, as women were expected to stay at home. The 1960s were baby-boom years that followed the return of men after the war and also of Australia's measure to populate against fears of external invasion (ABS 2004). In the 1970s, a time of strong unionism and the rise of a working-class ethos worldwide, very few women were part of and heard by unions. While "second wave" feminism was productive

Women's Voices

Megan Davis

Megan Davis is a lawyer and an indigenous activist from Australia. She is the current chair of the United Nations Permanent Forum on Indigenous Issues. Davis has always wanted to serve in the United Nations and said about her position, "It's very exciting. It's always a privilege to be elected by your peers to a body like this to be the chair" (Osborne-Crowley 2015). She is the first Australian indigenous woman to be elected to a UN body. Davis focuses on issues such as violence that affect indigenous women. She believes that many laws treat the experiences of indigenous men and women the same (Giggacher 2015). Yet indigenous women have specific gendered needs that should be addressed by the law. Before being elected to the UN forum, Davis worked "to lay the groundwork for constitutional recognition of . . . Aboriginal and Torres Strait Islander peoples," and to repeal a section of the constitution that allows racial discrimination when deciding who is allowed to vote (Robinson 2014).

in North America and Europe, it was a "meagre harvest" for Australian women (Kaplan 1996). The women's movement had been white and middle class. Aboriginal women felt left out in this so-called liberation movement as they fought their own battles against racism and class-based exclusion. Indeed, political action for woman, given the context of divisive social realities in Australia, is less straightforward. Progressive democratic ideals are difficult to uphold if some citizens more than others are structurally disenfranchised. Aboriginal Australians, for example, were only granted the right to vote in 1967. Despite such political contradictions, there are actions that contribute to a deeper conversation to reconcile Australia's difficult past, such as recovering convict ancestries and developing greater respect for Aboriginal culture (Tranter and Donoghue 2003).

Laws

Australian women's presence in politics manifested early in their suffrage movement in the context of a convict colony searching for a national identity. This also led to other advances, such as the setting of a minimum wage for working women by the Commonwealth Arbitration in 1912, followed six years later by the Women's Legal Status Act. The prohibition on employing married women was

permanently lifted in 1966, and equal pay for work was legislated in 1972 (Castles 1993).

The years 1976 to 1985, declared as the United Nations Decade for Women, saw Australia's engagement with gender issues. The Family Law Act 1975 quickly implemented the no-fault divorce that allowed many women to live their lives outside of marriage. In 1983, Australia ratified the UN Convention on the Elimination of All Forms of Discrimination against Women (CEDAW). A year later, the Federal Parliament passed the Sex Discrimination Act (Castles 1993). As a matter of course, the National Agenda for Women was established to give priority to issues that matter to women, specifically women's health policy. In the 1990s, Australia enforced the International Labor Organization (ILO) Convention 156 to ensure that workers with family responsibilities do not suffer discrimination in the workplace.

However, it has been argued that women's rights are not fully protected in Australia. The Sex Discrimination Act of 1984 "does not address systemic discrimination or promote substantive equality," as there is no prohibition on sex discrimination; actions are based on individual complaints. Moreover, domestic violence is a serious problem in Australia, with one in three women suffering physical violence. In particular, Aboriginal and Torres Strait Islander women experience "horrific levels of violence." They are 35 times

more likely to be hospitalized due to partner violence (Al-Yaman, Van Doeland, and Wallis 2006). Also, women from linguistically and culturally diverse backgrounds experience difficulties in reporting violence against them. Similar to women with disabilities, women identifying as LGBTQ experience violence that often goes undetected and unreported.

Migrant Activism

Migrant women have also been important agents in the Australian feminist movement. The 1970s saw the rise of migrant women activism, mostly involving working-class women. The Migrant Women Workers Project (1974–1975) was a significant endeavor that fused together ethnic community-based concerns and feminist ideals of women. While there had been attempts to forge solidarity with white Australian women's groups, there were claims that nonwhite women were only invited in and then generally left alone. This was so much the case that migrant women started forming their own groups in the 1980s, such as the New South Wales Immigrant Women's Speakout Association (1986) and the Association of Non-English Speaking Background Women of Australia (1987). Since then, migrant women's formations had been on the decline. There have been no significant new initiatives, which can perhaps be attributed to the conservative political culture during the leadership of John Howard (1996–2007) and the move toward individualized solutions rather than collective ones. Although this has been the case, there is not a complete absence of activism, as Muslim women's organizing has been strong since 2000 (Ho 2008). The Australian Muslim Women's Association, established in 2010, and the Australian Muslim Women's Centre for Human Rights, established in 1991, are two groups that create platforms to promote the welfare and rights of Muslim women in Australia beyond the religious and cultural levels,

Political Participation

In 2013, Australia ranked 44th among countries with the most women parliamentarians at 26 percent. The percentage increased the following year to 29 percent; yet, women still comprise less than one-third of all Australian parliamentarians. When compared to other OECD countries, such as Sweden's 45 percent, this is relatively low. Yet, the figure is close to the critical mass of 30 percent that is considered the minimum level needed for women to shape decisions made in the Parliament. But figures alone

do not contribute to transformative changes. What matters more is the quality of women's representation to bring about women-friendly policies. Women's experiences and worldview offer insights that highlight what could enrich the lives of millions of other women.

The slow progress in accelerating women's parliamentary participation is reflected in Australia's history. The first female national parliamentarian was only elected in 1943, although Edith Cowan became the first woman to gain a seat in a federal parliament in 1921. Women's figures were less than 5 percent until 1980. Moreover, Australia only elected its first indigenous female representative in 2013, Nova Peris, since the founding of the federation in 1901 (McCann and Wilson 2014).

Religious and Cultural Roles

Religion has always been part of Australian life. Aboriginal Australians' spiritual way of life for more than 50,000 years is rooted in the natural environment and based on oral traditions and reverence to the dead. Stories woven by Aboriginal Australians, called "Dream-time," show how the people value the oneness of life and land. The arrival of monotheism via Christianity has put religion in a central role in framing a polarized understanding of spirituality between indigenous and nonindigenous peoples. This has led to the devalorization of Aboriginal spirituality over time, and, more specifically, the tradition of Aboriginal women's leadership. Commanding great respect for their authority and wisdom, Aboriginal women hold the community of clans and families together. Women elders perform vital roles in teaching cultural and spiritual legacies of their traditions, in bringing the people together to resolve conflicts, and in keeping at bay the disintegration of Aboriginal peoples' legacies resulting from patriarchy, racism, and colonialism (Haebich 2014).

Since the introduction of Christianity, Australians have predominantly practiced Catholicism (25%), followed by the Anglican Church (17%), and other forms of Christianity (19%) (Henry and Kurzak 2012). However, the country has experienced secularization through the rationalist values of the Enlightenment, the other side of English colonization. The rate of people who have "no religion" has steadily increased and continues today. In 1911, 10,000 Australians claimed they had no religion, whereas, in 2011, 4.8 million Australians did so; that is 22 percent of Australians (ABS 2013c).

Finally, due to increasing migration, other religions such as Hinduism, Islam, and Buddhism—the fastest growing of the new faiths—are practiced by 7 percent of the whole population (Henry and Kurzak 2012). Males reported a slightly higher rate of having no religion, 24 percent compared to 21 percent of females. This pattern was established in previous generations, when women registered higher rates of religious affiliation. More educated Australians are unaffiliated with a religion than those with lower educational attainment (ABS 2013c).

The decline in formal expressions of religious belief among Australians is consistent with the spread of secularism in Western societies and the growing presence of women religious leaders. In 2001, there were 2,823 women who identified themselves as ministers of religion, compared to 11,415 men. These women could not have been from the Catholic and Orthodox churches that forbid women to lead, but from Uniting and Anglican churches. In the absence of Catholic resident priests, nuns and religious sisters perform crucial roles in the religious community (Porter 2014). Australian women religious leaders have remained active in promoting the ordination of women in the Catholic Church.

Section 116 of the Australian Constitution safeguards the practice of religious freedom. People are free to express a variety of opinions as long as they do not incite religious hatred. The Racial and Religious Tolerance Act of 2001 of the State of Victoria guarantees further protection of religious freedom in the wake of terrorist attacks in the West. This is particularly significant as more and more Australian citizens express their religious beliefs in public and also incorporate these beliefs in their community lives. The coming of non-European migrants to Australia has also been a migration of religion to Australia. Confucian, Buddhist, Sikh, Islamic and Taoist are some the recent religious beliefs that enrich Australian society. One consequence of this development is the establishment of private schools in Australia, 90 percent of which are religious, particularly fundamentalist Christian and Islamic schools (Henry and Kurzak 2012).

Issues

Violence

There are more male than female offenders registered in the criminal justice system in Australia. As per 100,000 of the population, 3,079 are male offenders, while only 846 are female offenders. This tendency is reflected in the

rate of imprisonment by sex: 318 men and 25 women per 100,000 of the population (ABS 2014e). While there are more men involved in incidents of violence, either as victimizers or victims, women figure dominantly as victims of sexual assault and intimate partner violence. They suffer violence nearly four times more at the hands of men than by other women (ABS 1996). These figures reinforce Australian women's plight as victims of sexual assault and partner violence. In 2012, 132,500 women suffered at the hands of their partners, while only 51,800 men did so (ABS 2014h). Women aged 25–34, with low educational qualification, from lower socioeconomic groups, and with a past history of child abuse were more likely to experience partner violence. Moreover, in 2005, 37 percent of women who were pregnant suffered some form of domestic violence, and more than one-third of all women who experienced violence returned to their partners at least once. An overwhelming 63 percent did not report the incident to the police in the year 2005. Overseas-born women are less likely to experience partner violence than those born in Australia. The estimated total cost of partner violence in Australia was \$8.1 billion in 2002 (ABS 2007b).

In Australian history, the removal of Aboriginal children from their birth parents in the name of “civilizing” them has been a violent past for both men and women of indigenous backgrounds. Called the “Stolen Generation,” 1

Fracking and the Environment

Mining in Australia has brought wealth to the country, billions of dollars of export income, and jobs to hundreds of thousands of Australians. However, expansive quarrying and hydraulic fracturing, commonly known as *fracking*, draw opposition from citizens concerned about Australia's environmental future. The fractures caused underground by high-pressure injection to release natural gas raise concerns that it may contaminate water sources and cause earthquakes. The state of Tasmania has banned fracking since 2014 and will continue to do so in the next five years to protect its agriculture. Another issue is the exploration of wilderness and Aboriginal lands, such as the Kimberley in Western Australia, for mining. Inhabitants and environmental groups continue to campaign for relaxation of land exploitation and protection of the flora and fauna.

in 12 Aboriginal Australian adults has personally suffered this separation (ABS 2012). Aboriginal women's testimonies have drawn attention to the injurious effects of such colonial policies that have wrought much harm among Aboriginal communities over generations. Babies and children taken away from their mothers under white Australia's "assimilation" policy is dramatized by Doris Pilkington Garimara's *Follow the Rabbit-Proof Fence* (1996), a story of three girls who walked for miles to find their way back home, which was later made into film by Phillip Noyce.

Further violence against Aboriginal and Torres Strait Islander women is evident in the controversial deaths in custody as investigated by the Royal Commission. Underlying issues of "racism, alienation, poverty and powerlessness resulting in hopelessness and alcoholism" are factors that contribute to the serious problem of deaths in custody that implies the disadvantage of indigenous women in the criminal justice system (Payne 1991). Furthermore, women and the law, as represented by the male police officer, is a reminder of the structural violence and racism committed by the Aborigines Protection Board during the years that terrorized the Stolen Generation. However, the oppression of women is not simply about race relations with white Australia. Indigenous women in the Northern Territory argue that they have been subjected to three types of laws: "white man's law, traditional law and bullshit law" (Payne 1991). The last type means the distortion of traditional law to justify attacks on women by Aboriginal males using culture to perpetrate gendered violence.

Among women migrants, on the other hand, those who come from the Philippines were especially subjected to sensationalist treatment from the media as victims of domestic violence. Called "mail-order brides"—for the introduction agency catalogs of women seeking male companions—a significant flow of marriage migrants have come to Australia. The figure rose sharply in 1978 and peaked in 1986 (ABS 2000). The presence of these mail-order brides attracted negative attention when instances of male-perpetrated violence were often interpreted as a natural consequence of being parasitical economic migrants. The Centre for Philippines Concerns–Australia (CPCA) counted 44 Filipino women and children victimized since 1980. Some women ended up quadriplegic, dead, missing, abandoned, beaten up, or forced to have an abortion, among other forms of violence. Cunneen and Stubbs (2000) revealed that Filipino women were six times more likely to be killed by intimate partners compared to other Australian women. Moreover, the

stereotyping of Filipino women migrants was aggravated by cultural productions, such as the iconic Australian film *The Adventures of Priscilla: Queen of the Desert* (1994), that depict them as gold-digging prostitutes. Despite the tightening of partner sponsorship laws in the 1990s as a result of responses by the Filipino community and Australian authorities to violence against women, marriage migration from the Philippines remained high.

In 2014, Australia released for the first time a report showing the links between partner migration and human trafficking into Australia. Human trafficking not only means labor or sexual exploitation but also loss of psychological freedom or personhood. The victims met their partners either through arranged marriages and family connections or Internet dating sites. Although marriage migrants are typically characterized as economically needy, some reasons are complex, including the desire to travel and experience other cultures, wanting to start a family, escape from war, or honoring a marriage arranged by the family. Marriage migrants who entered exploitative situations were usually women from Southeast Asia, the Pacific Islands, the Middle East, and Eastern Europe. While it may be argued that marriage itself, especially when it involves migration, requires consent, human trafficking in the guise

Partner Migration Human Trafficking

The Australian Institute of Criminology released a report in 2014 about a new way to traffic individuals via partner migration visa. This largely undetected crime involves Australian nationals who sponsor women who are then forced into labor and sexual exploitation. Unlike the more traditional trafficking of women, partner migration trafficking also means the loss of psychological freedom or the deprivation of personhood, even without sexual or labor exploitation. The victims met their partners either through arranged marriages and family connections or Internet dating sites. Although marriage migrants are typically characterized as economically needy, some reasons are complex so as to include desire to travel and experience other cultures, start a family, escape war, and honor the marriage arranged by the family. Many cases of exploitation are undetected until they involve police intervention.

of partner sponsorship may involve coercion, threat, and deception. Some of the exploitative situations that partners, most of whom are women, endure are domestic violence, threats of harm, denial of education, daily fear and intimidation, denial of religion, sexual violence, and violence against their children. Australia has started to act to stop human trafficking through an information campaign to prospective migrants, amendments to migration regulations, and further research to improve the detection of human trafficking (Lyneham and Richards 2014).

There has been intolerance toward Muslim Australian women, particularly since 2001. Vandalism and attacks on women whose hijabs are ripped off and refusal of service at banks have been reported in different parts of the country. A 2012 report shows that a large-scale survey indicated that almost a quarter of Australians have a negative perception of Muslims (Henry and Kurzak 2012). Especially in the aftermath of the “Sydney siege,” where a lone attacker took hostages in the city center in early 2015, anti-Muslim sentiments ran high. A social media campaign, Ride with You, expresses solidarity among Australian women to safely travel together in public transport during these troubled times.

Outlook for the Future

Half of 23 million Australians in 2014 are women, but only one-fifth of women occupy ministry positions. Moreover, 96.5 percent of leadership positions in the top 200 ASX companies are held by men; only 3.5 percent are held by women. In the list of Order of Australia, 71 percent of awardees are men, while women bagged a meager 29 percent (ABS 2014e). It may seem that the future of Australian women is bleak given these figures. However, if contextualized by Australia’s historical past, when settler women were considered “drunken whores” and then “convict maids,” Australian women have come a long way. Compared internationally, mainstream Australian women do perform better than women in other countries in terms of access to political, social, and economic rights. Australia is ranked 19th in the 2013 Gender Inequality Index (UNDP 2014). Women in Australia enjoy high rates of literacy and educational attainment, social welfare provisions, access to divorce and reproductive health, and can look forward to a strong economy that provides employment and a pension system.

The prospects for women in general are mixed. There are setbacks, such as the pay gap and low political

representation for all women, but, more particularly, there are structural inequities that negatively affect Aboriginal and migrant women. Nonetheless, these challenges can be the source of continued inspiration for the women’s movement to soldier on and to draw from its strengths. The process of reconciliation between white Australia and Aboriginal Australians and Torres Strait Islanders would be formally recognized in the Keating government-sponsored report *Bringing Them Home*. As a result, in 2008, former prime minister Kevin Rudd formally apologized to Australia’s indigenous peoples “for the pain, suffering and hurt of these stolen generations . . . and for the indignity and degradation thus inflicted on a proud people.” This occasion is a start that Australian women can look forward to.

B

Bangladesh

Overview of Country

Bangladesh, officially known as the People's Republic of Bangladesh, is situated in South Asia. Bangladesh shares borders with India and Myanmar and is separated from Nepal and Bhutan by the small corridor-like land of Shiliguri, India. The Bay of Bengal is in the south of the country. It is the eighth most populous country in the world, with 168 million people, and the most densely populated among the countries that cross the 10 million mark. The present-day borders of Bangladesh took shape during the Partition of Bengal and British India in 1947, when the region came to be known as East Pakistan, as a part of the newly formed state of Pakistan. It was separated from West Pakistan by 870 miles (1,400 km) of Indian territory. Political exclusion, ethnic and linguistic discrimination, and economic negligence by the dominant western wing, nationalism, popular agitation, and civil disobedience between West Pakistan and East Pakistan (now Bangladesh) led to the Bangladesh Liberation War and independence in 1971. After independence, the new state endured poverty, famine, political turmoil, and military coups. The restoration of democracy in 1991 has been followed by relative calm and economic progress. In 2014, the Bangladeshi general election was boycotted by major opposition parties, resulting

in a Parliament and government dominated by the Awami League and its smaller coalition partners (IBP 2014).

Bangladesh is a unitary parliamentary republic with an elected Parliament called the Jatiyo Sangshad. The native Bengalis form the country's largest ethnic group, along with indigenous peoples in northern and southeastern districts. Ninety-eight percent of the population is Bengali. Islam is the main religion of Bangladesh and is practiced by 89.5 percent of the population. Hinduism is practiced by 8.5 percent of the population, Buddhism 0.6 percent, and Christianity 0.3 percent. Bangladesh's documented history spans 4,000 years. Its human history has lasted for more than 20,000 years (U.S. Department of State 2012).

According to the UN Development Programme (UNDP), Bangladesh has a Gender Inequality Index (GII) value of 0.518, ranking it 111th out of 148 countries in the 2012 index. In Bangladesh, 19.7 percent of parliamentary seats are held by women, and 30.8 percent of adult women have reached a secondary or higher level of education, compared to 39.3 percent of their male counterparts. For every 100,000 live births, 240 women die from pregnancy-related causes, and the adolescent fertility rate is 68.2 births per 1,000 live births. Female participation in the labor market is 57.2 percent, compared to 84.3 for men (UNDP 2016).

Bangladesh is one of eight countries that has a higher male population than female. As the majority of the country follows Islam, the idea of *purdah*, or veil, is still contested

in terms of whether it serves as a vehicle of discrimination or empowerment. In dominant Western discourse, veiling is often considered restrictive of women's rights, but others say it empowers women. Though the import industry is dominated by a female workforce, women are mostly unseen outside of their domestic sphere in the rural areas. Women make up higher percentages than men of the labor force in the garments industry, but the terms of equality are measured in various areas beyond employment. Their status and position is also measured in terms of education, income, assets, health, and the role they play in the family and in society. These characteristics are representative of the amount of political power and social prestige a woman is accorded, and thus the extent to which she can influence decision making within the home and community.

Girls and Teens

Girls and teens in Bangladesh face pervasive gender discrimination and obstacles in their development in almost every aspect of their lives. Girls are often considered financial burdens to their families, and from the time of birth, they receive less investment in their health, care, and education. As a girl child grows and reaches adolescence, the gender disparities are clearly presented to her by the society. The growth of a young girl to adolescence is treated abruptly within Bangladesh. At puberty, girls' mobility is often restricted, which limits their access to livelihood, learning, and recreational and social activities.

Bangladesh has the fourth-highest number of child marriages. There are also high numbers of adolescent mothers. Though the maternal mortality rate has improved, it is still relatively high in comparison to other countries. Poor maternal health is the result of early marriage, women's malnutrition, lack of access to and use of medical services, and lack of knowledge and information. Most women give birth without a skilled attendant (UNICEF 2016a).

In the home, especially in rural areas, women's mobility is greatly limited, and their decision-making power is often restricted. Though the situation is changing in the cities where women are becoming more financially independent, there are still restrictions imposed by husbands in terms of power in the household. For instance, 48 percent of Bangladeshi women say that their husbands alone make decisions about their health, while 35 percent report that their husbands alone make decisions regarding visits to family and friends (UNICEF 2016b).

Violence against women is another major impediment to women's development. Street harassment, eve teasing, abductions, and rape are common phenomena in Bangladesh. Perpetrators are rarely held accountable, and even if they are, they frequently receive no or very little punishment within the legal system (Hossain and Suman 2013).

Child Marriage

Bangladesh has the highest rate of child marriage of girls under the age of 15 in the world, with 29 percent of girls in Bangladesh married before age 15 (UNICEF 2016). Two percent of girls in Bangladesh are married before age 11. Continuous inaction by the central government and complicity by local officials allows child marriage, including of very young girls, to continue unchecked, while Bangladesh's high vulnerability to natural disasters puts more girls at risk, as their families are pushed into the poverty that helps drive decisions to have girls married.

Child marriage has been illegal in Bangladesh since 1929, and the minimum age of marriage has been set at 18 for women and 21 for men since the 1980s. Despite this, Bangladesh has the fourth-highest rate in the world of child marriage before age 18, after Niger, the Central African Republic, and Chad. Sixty-five percent of girls in Bangladesh marry before age 18 (HRW 2015).

The reasons behind the elevated rate of early marriage stem from traditional Bangladeshi customs and moral codes as well as social and economic conditions. In Bangladesh, a patriarchal, unequal society prevails. Poverty is also a major underpinning factor that encourages early marriage. Because young girls are often considered an economic burden by their families, their marriage to an older man and into another family may be seen as a family survival strategy to obtain financial security. Additionally, parents are attracted by the prospect of lower dowry payments if they marry their daughters off at an early age. Another root cause of early marriage in Bangladesh is the fear of sexual harassment of young daughters. Early marriage is seen as a way to "protect" a girl's sexuality in an unsafe environment (HRW 2015).

The prime minister of Bangladesh, Sheikh Hasina, vowed to end child marriage in 2014's Girl Summit, but, controversially, it has taken a step that promotes child marriage even more than before. Rather than eradicating child marriage, the Bangladesh government, with the consent of the prime minister herself, has promoted a new law lowering the minimum age for a girl to be married to 16

instead of 18. This creates a bigger threat to girls and teens in Bangladesh, and if 16 is the legal age for a girl to be married, child marriage will be further validated.

Education

Education is essential to reducing discrimination and violence against girls and women, and Bangladesh has made great progress in this area, already achieving gender parity in primary and secondary education. However, Bangladesh still has a long way to go to achieve gender equity, access to quality education for all girls, completion of basic education with acceptable competency levels and relevant life skills, and equal roles for women and girls in society.

Education is the key to addressing entrenched discrimination and violence against women. Research suggests that the presence of more educated children in the household and community acts as a restraint on violence against women (World Bank 2008). In addition, educated girls tend to delay marriage, are more likely to seek help during childbirth, and are more likely to give birth to healthy babies who will survive and grow into adulthood. Bangladesh has made immense gains in girls' education, such that girls now outnumber boys in primary and secondary schooling (GED 2015). However, net attendance rates in secondary education are still extremely low, at only 53 percent for girls and 46 percent for boys. In tertiary education, there are only 6 girls for every 10 boys, well below the Millennium Development Goal target of full equality (UNICEF 2016).

Women typically receive less education than men their age. According to the UNESCO statistics 64.64 percent of men over the age of 15 are literate, compared with 58.31 percent of women (World Bank 2015).

Health

The health of women is a crucial factor in the health of children, but gender discrimination leaves women in Bangladesh particularly vulnerable to disease and death. The maternal mortality rate (MMR) declined from 440 per 100,000 childbirths in 1997 to 320 per 100,000 childbirths in 2001. Translated into real numbers, this means that of 2.5 million women who become pregnant each year, an estimated 370,000 develop fetal complications, which the health facilities in the country are neither equipped nor able to handle. Increasing access to emergency obstetric care is a key element in reducing maternal mortality (UNICEF 2016).

Only 8.6 percent of births take place in hospitals or local health centers, and in 2001, only 11.8 percent of deliveries were assisted by doctors, midwives, nurses, or family welfare visitors. The remaining 88.2 percent were attended by relatives or other people, of whom only 11.9 percent included trained traditional birth attendants (UNICEF 2016).

The health-seeking behavior of women during pregnancy and childbirth is low: 48 percent utilize antenatal care, and 16 percent access postnatal care. There is also evidence of a disparity in health-seeking behavior according to educational and economic status. Poorer, less educated women are less likely to seek qualified routine or emergency obstetric care. Only 40 percent of women who perceived that they had life-threatening complications during their pregnancy sought immediate care—70 percent of women in the highest wealthy quintile of the population and 50 percent of those in the lowest quintile.

Maternal malnutrition, infections during pregnancy, anemia, and repeated pregnancies contribute to low birth weight babies and a high rate of maternal mortality. The maternal mortality rate is among the highest outside sub-Saharan Africa, and the vast majority of infants are born at home. The nutritional status of women in Bangladesh is also alarming. The body mass index (BMI) of 52 percent of women of reproductive age is less than 18.5; this means they are extremely underweight. This has been compounded by a high prevalence of iron-deficiency anemia (more than 50%) and vitamin A deficiency (for example, more than 2.8% suffer from night blindness) (UNICEF 2016).

The poor nutritional status of female children at birth is compounded by a lack of access to various services, resources, and opportunities, and it is associated with high workloads and lack of rest. All of these factors result in poor health and malnutrition, and many women continue to be sick throughout their adult lives.

It is not possible to reduce the rate of maternal deaths solely through health and nutrition initiatives. Maternal mortality is an indicator of the overall situation of women in a society, so a more comprehensive social development approach is needed. This means nurturing a sociocultural movement that addresses the reduction of maternal mortality as a woman's right and also enhances women's self-esteem and status.

Statistically, Bangladesh has experienced significant improvements in women's health over the past three decades. Women's life expectancy, for example, increased from 54.3 years in 1980 to 69.3 years in 2010, one of the largest increases in the region (ILO 2014).

Access to Health Care

The government of Bangladesh, according to the Constitution of the People's Republic of Bangladesh, is responsible for securing health care for its citizens. Over the past few decades, through efforts by the government as well as international organizations and nongovernmental organizations (NGOs), access to health care in Bangladesh has improved. More recently, health services have begun to transition from free public services to for-profit private services. The public sector mainly provides outpatient, inpatient, and preventive care, while the private sector mainly provides outpatient and inpatient curative care (IMPOWR 2012).

In Bangladesh, however, inequities regarding access to medical services exist based on both socioeconomic status and demographics, such as geographical location—urban versus rural—as well as gender. As nearly half the population lives below the poverty line, and many of the poor live in rural areas of the country, individuals in such areas may experience difficulty accessing medical care due to a lack of monetary resources and available medical facilities. To address this latter issue, the government recently began supporting the opening of community clinics within rural communities. Additionally, Bangladeshi women are denied equal access to health care. The Committee on the Elimination of Discrimination against Women (CEDAW) stated that it “is concerned at women’s limited access to quality health care services, including reproductive health-care, specifically in rural areas” (IMPOWR 2012). Efforts are being made to increase Bangladeshi women’s access to medical services, but even if access is expanded, social prejudices may prevent some women from utilizing such services.

Employment

In the economic field, women play a vital role, as evidenced by the importance of the ready-made garment (RMG) sector. While the number of men and women employed in manufacturing is roughly the same, the vast majority of RMG-sector workers are women—80–85 percent (ILO 2014). It is to be noted that, in most cases, employers engage garment workers, mainly women, in factories without any formal agreement or job contract. Thus, they can be easily hired and fired, and no compensation is offered when they are laid off in the interest of factory owners.

Bangladesh recently amended the Labour Law in 2013, which protects the fundamental rights of women workers,

including the right to maternity leave (HRW, 2015). At the international level, Bangladesh has ratified the UN Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) as well as ILO Convention 111 on Discrimination in Employment and Occupation. The reality is that, despite such legislation, women workers’ rights remain ignored in the garment sector. Women workers are employed in poorly paid jobs, and they face severe labor rights violations and not getting their legal entitlements. They are also forced to work at night, often exceeding 10 working hours, which is a violation of the labor standard.

Women are poorly paid in this sector. Because of sustained campaigning by women workers, women’s rights and human rights activists, and other trade unionists in Bangladesh, the minimum wage for garment workers was raised in 2010 for the first time in four years. Receipt of wages in the garment industry depends on meeting an assigned production target. If production targets are met, a sewing operator’s salary now starts at 3,861 taka (approximately USD\$47.882) per month and a helper’s wage at 3,000 taka (USD\$30) per month. This amount is inadequate in meeting the minimum living standards in the urban areas. Besides the above, they get no other benefits or festival allowances (festival allowances are given in the time the prominent religious festivals, such as Eids, in standard private or government jobs in Bangladesh) (ILO 2014).

Similar to the recognition of women’s contributions to agriculture worldwide, women’s roles in Bangladeshi agriculture tend to be underappreciated, owing to the commonly held view that women are not involved in agricultural production, especially outside the homestead, because of cultural norms that value female seclusion and undervalue female labor. Nevertheless, women’s participation in the agricultural sector has increased over time. According to the Bangladesh Bureau of Statistics, during 1999–2000 and 2005–2006, the number of employed persons in agriculture increased from 19.99 to 22.93 million—about 15 percent. For male labor, there has been an absolute decrease of about 6 percent, while the number has increased from 3.76 to 7.71 million for women—more than 100 percent. Because of such changes, the proportion of women in the agricultural labor force has increased from less than 20 percent to 33.6 percent of the total (FAO 2010.). This is indeed a phenomenal change, although it is not yet clear how much of this change resulted from a true secular increase as opposed to a better measurement of women’s participation.

According to the World Bank, Bangladesh creates around 1.2 million jobs every year, mostly benefiting men. The latest Bangladesh Development Update suggests that to comfortably reach middle-income status by 2021, Bangladesh needs more women to join the workforce. Bangladesh can increase its gross domestic product (GDP) growth by 1.6 percent if female labor participation increases from the current 33.7 percent to 82 percent, a figure on par with the present male labor participation rate (World Bank 2008).

In a report made by advocate Salma Ali, the executive director of Bangladesh National Women's Lawyers' Association, over the last three decades, the emphasis in Bangladesh has been on ensuring gender equality and mainstreaming gender issues through various policies and strategies to ensure employment of women in various professions. The government is a major employer in Bangladesh; thus, the appointment of women in Bangladesh Civil Service (BCS) and their inclusion in different cadres is very significant and needs special consideration from various perspectives. The government of Bangladesh has already made several policy decisions and taken special measures to ensure equitable female participation in civil service. A quota system was introduced to increase the presence of women in the government employment sector, though women's participation in government services has not yet reached a satisfactory level. BCS has more than 1.1 million civil servants in 37 ministries, 11 divisions, 254 departments, and 173 statutory bodies. Ten percent of posts are reserved for women. There has been progress in the numbers of women in service at mid and senior levels, from 8.5 percent in 1999, to 15 percent in 2006, and 21 percent in 2011 (UNDP 2016).

Similar to women in civil services, women's participation in law enforcement services is also very low. The number of women participating in the police and army is very small but steadily building up. At present, the total number of police officials is 154,921. The total number of working police officers is 144,411. Of all officers, the number of female police officers is 7,561, comprising just 5.24 percent. The Bangladesh Army did not recruit women for many years. However, in 2003, and following the lead of many armies in the world, the Bangladesh Army decided to recruit women as commanding officers. In the past, this post was considered to be only for men. These female officers proved that they are as good as their male counterparts. Some women officers even worked for UN peace-keeping forces. For the first time in the country's military

history, some 1,263 female soldiers were recruited. Of these soldiers, 945 were for the medical core and would be in training for one year.

In the social sphere, Bangladesh is an example of what is possible when women are involved in decision making. Indeed, it is a heartening story of social innovation and development, in part due to microfinance, which has played an integral role in rural and social development in Bangladesh. Ninety-two percent of borrowers are women, and 90 percent live in rural areas. While there is some debate over the efficacy of microfinance in poverty reduction, some studies have shown that, in Bangladesh, female participation in microfinance activities has led to an increased sense of empowerment measured by factors such as decision making, social acceptance, and political involvement, which in turn have led to general welfare improvements.

For example, Bangladeshi mothers increasingly have a say in their children's education. The country has managed to reduce the gender gap at all levels of education, particularly at lower levels of education, that is, youth literacy and secondary school enrollments. In these two areas, disparities have been reduced at a faster rate in Bangladesh than the global average.

Women spend five times more time on unpaid household chores than men, an effort that remains unrecognized at both family and national levels, according to a study by ActionAid Bangladesh that surveyed 316 people in the rural north. Women devote an average of 6.45 hours each day to care work at home, compared to men's average of 1.2 hours a day. Most of women's unpaid work involves cooking, and a woman will spend 12 out of 72 years of her life cooking, said Sadananda Mitra, a former deputy director of the Bangladesh Bureau of Statistics, presenting the study at Spectra Convention Centre in Dhaka. Women's employment rates remain low despite progress, and their wages are roughly 60–65 percent of male wages (Byron and Rahma 2015).

The maternity leave policy available to women in Bangladesh is 16 weeks with full payment. However, interestingly enough, there are no specific laws that exist for management-level women staff. The law that exists is Bangladesh Sromo Ain, 2006, or the Bangladesh Labour Act, 2006. The "Maternity Benefit" chapter refers to workers that do manual work, mainly in factories. The leave period that is guaranteed to nonmanagement women workers is similar to what is available in Pakistan, Singapore, and Sri Lanka (Bangladesh Labour Law 2006).

Family Life

Bengali families are highly hierarchical. The notion of hierarchy becomes operative primarily through the male-female divide and, thereafter, through age. Women and female children always come second in family hierarchies. Women are supposed to look after the house and children. Their main task is to produce offspring and tend to them as they grow up. To a greater or lesser degree, women in Bangladesh are subjected to the regime of *parda*, that is, customary practices through which honor and purity are preserved. This entails a regime of physical and psychological seclusion.

Parda is stronger within the Muslim community and Hindu high castes. The status of a community is measured by the degree of modesty of the women. Male offspring are by far the first desire of many families. Baby girls are frequently not wanted or desired and may receive a less enthusiastic welcome than that reserved for male children. While in rural areas giving birth to girls is not as appreciated as giving birth to boys, within the rising middle class of the country, the stigma associated with giving birth to girls is not as prevalent as before.

Children are usually considered the property of fathers. Boys benefit more from inheritance than their sisters. There are, however, differences among communities. Some indigenous communities in Bangladesh follow a maternal family system where women are considered first for property inheritance. Nevertheless, overall, women are frequently considered inferior to their male counterparts.

Giving a dowry to the groom's family has always been one of the biggest social problems in Bangladesh, and dowry-related situations create further problems in family life after marriage. The Dowry Prohibition Act 1980 outlaws dowries, with a maximum penalty of five years' imprisonment, and safeguards from physical abuses are repeatedly affirmed in several pieces of legislation (Constitution of the People's Republic of Bangladesh 1972). Women's dignity as a core value of human rights law is deeply entrenched in numerous international instruments, and Bangladesh also assumes affirmative obligations to respect and ensure this right. Despite this, dowry-related cruelty is endemic. In 2011 alone, dowry-related violence claimed 325 lives and resulted in 7,079 incidents of dowry harassment (Begum 2014a). This represents only a fraction of the total dowry victims, as women are very reluctant to unearth their "hidden wounds" publicly for several reasons, including loss of family honor and privacy, fear of in-law reprisals, and poor

Women's Voices

Abritty Abdullah

Growing up in Bangladesh with both of my parents working would have been impossible if I did not have my other "mom" taking care of me. In the city of Dhaka, where a kid is born in a middle- to high-income household where both the parents work, hiring maids for taking care of the children and household is the only way of bringing them up. My friends, my cousins, and I, and even my nephews, had someone taking care of us while our parents were gone working.

The idea of day care, husband and wife sharing household work, babysitting, or having help for a particular time is not popular in Dhaka due to financial constraints and the patriarchal framework. The women who come as maids in the households stay there 24/7 without a day off, and they work for the minimum possible salary because shelter and food is provided for them. My other mom, whom my brother and I used to call *Apa* (sister), stayed in our household for 24 years. Eventually I became her daughter, and she became my mother. My parents will probably never be able to pay back what she has done for us. My whole being is indebted to this person who has no blood ties with me yet is as important as the idea of mother to me.

She and my mom are equally responsible for my existence here in this world. I love them both equally, and whatever achievements I have made are a tribute to their hard work. I can only love my *Apa* back, because there is no way I can pay her back.

access to inadequate and costly legal remedies. Further, in a substantial number of cases, influential perpetrators act with impunity due to corruption, and victims are left with virtually no legal recourse (Begum 2014b). The underlying cause of this rising trend of violence, notwithstanding, the existence of a series of positive statutes necessitates an exploration of factors affecting the origins and development of dowry and how it is addressed in Bangladesh.

The distinction between state laws and religious laws often creates further confusion in terms of family laws, contributing to a situation where women face complex

forms of discrimination. This is particularly devastating for poorer groups within Bangladesh who have little to no access to knowledge of state laws and may be controlled by family and religious laws. Muslim personal laws are discriminatory in their embrace of polygamy for men, their greater barriers to divorce for women than men, and their limited provisions on maintenance. Under the Muslim family laws in Bangladesh, women have no right to maintenance beyond 90 days after notice of divorce (or birth of a child, if the woman is pregnant at the time of divorce).

Hindu personal law also discriminates against women. It recognizes polygamy for men and contains significant barriers for women to access maintenance payments. Hindu women can seek judicial separation, but the law does not recognize divorce. In Christian personal law, divorce is allowed on limited grounds for both men and women, but the grounds are far more restrictive for women. Men can divorce if they allege their wife committed adultery. Women, on the other hand, must prove adultery plus other acts to secure a divorce. Such acts include conversion to another religion, bigamy, rape, sodomy, bestiality, desertion for two years, or cruelty. Charges of adultery are particularly humiliating for women in Bangladesh's conservative society.

Bangladesh has taken the important step of establishing specialized family courts that deal with separation, divorce, and maintenance cases. But women and lawyers told Human Rights Watch (HRW) that seeking timely maintenance in these courts is akin to an obstacle course. They described delays at every stage, nonexecution of maintenance awards, and evidentiary challenges. Some women face harassing countersuits by husbands.

Women whose husbands are too poor to pay or who have no marital assets need to be connected to social assistance programs and shelters, according to HRW. Bangladesh does have some social assistance schemes that could benefit women impoverished by separation or divorce, including one offering 300 takas (USD\$4) per month for "husband-deserted" women who meet need criteria. But among the many women interviewed by HRW who could have qualified for this program, none had accessed it. HRW also found that the social assistance programs do not address women's multiple vulnerabilities, such as disability, ill health, old age, and marital breakdown (HRW 2015).

In Bangladesh, under Islamic law, the wife inherits a fixed share of one-eighth of the deceased husband's property if he leaves children, whereas the husband receives one-fourth of his deceased wife's property. If he does not

leave any children, then the wife inherits a quarter of the husband's estate. A daughter who is an only child inherits half the estate of her late father or mother. If there is more than one daughter and no son, then the daughters jointly inherit two-thirds of the estate. However, if there is a son, then the daughter's share will be equal to half of the son's share. In all cases, men inherit more than women.

Among Hindus in Bangladesh, a large number of women are also excluded from inheritance. According to Hindu law, not all daughters of a man are equally eligible to inherit. Unmarried daughters and married daughters with sons can inherit, while childless widowed daughters or daughters having no son are excluded. A Hindu woman, even if she inherits, has limited rights to her property in the form of life interest (i.e., on her death, the property reverts to the next heir of the person she had inherited the property from). A widow inheriting property from her husband also inherits on limited rights (i.e., life interest). Buddhists in Bangladesh are also governed by Hindu laws.

Birth Control and Contraceptive Care

In Bangladesh, the average number of children per woman of reproductive age has decreased dramatically in recent years. This figure was above seven in the early 1970s, but according to the World Bank, it is now 2.2. Bangladesh currently has the lowest total fertility rate in South Asia. Family planning in Bangladesh (then West Pakistan) was introduced in the 1950s through voluntary efforts by social and medical workers. In 1965, it was adopted as a full-fledged government-sector program. Since then, the national family planning program has changed and evolved. Large-scale, field-based family planning programs from 1965 to 1975, which later focused on maternal and child health (MCH), supported multisectorial family planning programs from 1975 to 1980. Most recently, since the 1980s, it has turned into an integrated health and family planning program with emphasis on MCH, contraceptive health care, and primary health care.

Contraceptive health care in Bangladesh has evolved through the time. With the help of three major components of the family planning program—the government, NGOs, and a subsidized commercial sector—Bangladesh has done remarkably well in comparison to other South Asian countries. Associated with increasing contraceptive use, the country's total fertility declined from 6.3 births per woman in the mid 1970s to 3.4 births for the period 1991–1993. The most dramatic decline happened between

1989–1991 and 1991–1993, from 4.3 to 3.4 births, or 21 percent, in a short period of two years. The inexpensive cost associated with contraceptive care—which is even free in some rural areas of the country—has helped to shape the change in fertility rate (UNICEF 2016).

Politics

Bangladesh has the eighth-lowest gender gap in terms of women's political empowerment in the world. This is largely because it has had a female head of state for longer than any other country in the world. In addition, the number of seats held by women in the national Parliament doubled from 10 percent in 1990 to 20 percent in 2011, according to the International Labour Organization's (ILO) Web site. To encourage and ensure women's participation, the Bangladeshi Parliament has 50 seats reserved for women that are appointed on elected party position in the Parliament. Women's growing presence in the political field has had important implications on the family structure. The traditional views that women are an economic liability and that sons are more desirable than daughters are being challenged now, and the society is moving away from such attitudes. Studies show that the growing independence of women is one of the major causes of a decline in gender-based infanticide in Bangladesh (ILO 2014).

Bangladeshi women have achieved great improvements due to their continuous struggle since the country's formation. The last four decades have seen increased political empowerment for women and the adoption of new laws to protect women's rights. As of 2016, the prime minister of Bangladesh, the Speaker of the Parliament, and the leader of the opposition (supposedly the most prestigious political positions) are women.

Begum Rokeya is popularly known to be the pioneer for the gender equality movement in undivided Bengal (especially for what is now Bangladesh as well as for Muslim women). She established the first school aimed primarily at Muslim girls in 1909. This was a revolutionary effort made at that time, when Muslim girls were segregated from the mainstream education system and were not allowed to leave their homes on their own. Rokeya paved the way for Bengal's (now West Bengal and Bangladesh) Muslim girls' education. She is considered by many to be the first feminist of Bengal. Rokeya's advocacy on behalf of Bengali Muslim women a hundred years ago has evolved, and women in Bangladesh are now almost everywhere, prominently marking their identity (Byron and Rahma 2015).

Organizations Working for Women's Rights

Bangladesh is home to what has been described as a vibrant women's rights movement. It consists of several hundred grassroots groups and a number of larger organizations. The largest is the Bangladesh Mahila Parishad, with a claimed membership of around 130,000 individuals and 52 branches in various parts of the country. Other prominent organizations identified include Ain O Salish Kendra, Mahila Samity, Proshika, Bangladesh Rural Development Committee (BRCA), Mohila Awami League, Nijera Kori, Nari Pragati Sangha, Karmojibi Nari, Samata, Usha, Step towards Development, Nari Pakkha, PRIP Trust, Bangladesh Muktiyoddha Sangsad, and the Samajik Proti-rodh Committee. An annotated list identifying some of these organizations appears in a UN Economic and Social Commission for Asia and the Pacific (UNESCAP) report on women in local government. The list provides information on their respective aims and activities and a snapshot of the overall diversity of the women's rights movement in the country. Some, like Proshika and BRAC, are primarily involved in microeconomic empowerment, while others, like Ain O Salish Kendra, are primarily concerned with promoting legal rights (Tahmina 2005).

Participation in Government

The prime minister and leader of the opposition are both women who, collectively, have ruled the country back and forth for more than 20 years. In 2012, there were also 6 female ministers and state ministers in the 44-member cabinet, including the leaders of important ministries, such as defense, foreign, energy, agriculture, and home. There were 69 women lawmakers in the Parliament, 19.7 percent of the total seats. Nineteen of these women were directly elected, and 50 women were elected through the gender quota system (Asia Foundation 2012). The statistics may indicate a triumph for women overcoming past exclusion, but the underlying patriarchal dominance is still alive in the society.

There are still unequal power relations in the political arena of the country. Women are discouraged from entering the political arena by preexisting social norms that associate leadership with men. Despite two prominent female leaders, the prime minister and the opposition leader, who both come from influential political families, the number of women in political spheres and leadership positions in the country remains low. The top leaders in the Parliament choose who should run for political offices and

ministries, and they are almost all male. While the faces of the two ruling parties are women, the construction of both parties is done by their male colleagues. Though the final decisions are up to these two strong female leaders, the system is largely organized and led by male politicians and decision makers. Nevertheless, the prominence, power, and importance of these two women leaders is notable.

Women's Rights in Bangladeshi Law

According to the constitution, women's rights are protected under the broad and universal principles of equality in the following articles: Article 10 provides that steps shall be taken to ensure participation of women in all spheres of national life; Article 19 (1) provides that the State shall endeavor to ensure equality of opportunity to all citizens; Article 27 specifies that all citizens are equal before the law and entitled to equal protection; Article 28 (1) provides that the State shall not discriminate against any citizen on grounds of religion, race, caste, sex, or place of birth; and Article 28 (2) says that women shall have equal rights with men in all spheres of the State and of public life. In addition, Bangladesh has specific laws prohibiting certain forms of violence, including the Penal Code, 1860; the Anti-Dowry Prohibition Act (1980); the Cruelty to Women Ordinance (1983); the Suppression of Immoral Traffic Act (1993); and the Prevention of Repression against Women and Children Act (2000).

However, despite such legal support, Bangladeshi women still do not receive equal treatment in reality. According to the *Dhaka Tribune*, women in the informal sector are often paid lower wages than men for the same work (Mostafiz 2013). In divorce proceedings, women need to prove the validity of their reason for seeking divorce to obtain a court order to enforce their rights. Men on the other hand, do not need such proof and can divorce their wives at any time without proven reason. Under traditional inheritance laws, a woman is generally given half the share of her male counterpart. Despite anti-dowry laws by the state (and religious edicts supporting this position), traditions remain widespread, and women whose families do not fulfill requests to pay dowry to their husbands are sometimes subjected to horrifying forms of violence.

As is well known, women who turn down marriage proposals are sometimes in danger of suffering violence from spurned men, and there have been many reported cases of men throwing acid at women. The Ministry of Women and Children Affairs set up assistance cells to help victims of violence in the 1990s, but the numbers of cells are

not enough to deal with the large number of cases. Many attacks go unreported due to fear of not getting any justice, fear of retaliation, or sheer lack of knowledge about where to go for help (Mostafiz 2013).

LGBT Rights

In Bangladesh, the laws center and reinforce a gender binary, and there is hardly any indication of nonnormative genders or sexual minorities in the laws of Bangladesh. The self-identified gay, lesbian, and transgender population remains confined within the highly religious cultural and political setting of the country, and the infamous Penal Code 377 still exists in the law of the country. Members of the LGBTQ community in Bangladesh encounter social, cultural, and economic forms of oppression and violence. Outside of male and female, the only recognized other gender within Bangladesh is *hijra* (or what some refer to as the transgender female group), who experience extreme marginalization. As Khan et al. state, "In Bangladesh, mainstream society does not accept others beyond the male-female gender norm. Those who live beyond this continuum are subject to harassments and abuses" (2009).

Section 377 of the Penal Code criminalizes anal sex between men and other homosexual acts. This was introduced by the British Raj during colonial rule in India as Section 377 of the Indian Penal Code and was later used as the model of many antisodomy laws in many other British colonies. The law dates back to 1860, when it was introduced by the British colonizers to criminalize sexual activities "against the order of nature," arguably including homosexual acts. Prior to Section 377 and British colonial rule, there were no specific laws defining sexual norms.

Similar to other colonized countries, Bangladesh also adapted the British-imposed law after its independence under the same penal code number. On the Ministry of Law's Web site, Section 377 states, "Whoever voluntarily has carnal intercourse against the order of nature with any man, woman or animal, shall be punished with [imprisonment] for life, or with imprisonment of either description for a term which may extend to ten years, and shall also be liable to fine" (Ministry of Law, Bangladesh 2016). According to Section 377, any sexual union other than the penis in vagina is punishable under the law. Thus, even consensual heterosexual acts such as fellatio and anal penetration may be punishable under this law. This law's existence threatens any sexual relationship or activities outside of heterosexual norms.

Religious and Cultural Roles

The main religion in Bangladesh is Islam (89.7%), but a significant percentage of the population adheres to Hinduism (9.2%). Other religious groups include Buddhists (0.7%, mostly Theravada); Christians (0.3%, mostly Roman Catholics); and Animists (0.1%) (BANBEIS 2016).

In Bangladesh, gender norms are intimately bound up with religious beliefs and cultural practices, as they are throughout the world. Women's empowerment efforts have at times been strongly opposed by conservative groups, often citing religious scripture to defend patriarchal practices. Given the fact that these practices and the ideologies that undergird them are deeply enmeshed in the social fabric of Bangladesh, critics have questioned the extent to which development approaches that target women in isolation and focus narrowly on areas such as economic empowerment or health interventions can adequately address ingrained social norms. Such critiques have been at the heart of recent work that has found that patriarchal power structures in the home have severely limited women's control of microloans, offering them little real empowerment in such programs and trapping them in cycles of debt. It is clear that if the objective is bringing about substantial and lasting progress for women's empowerment in Bangladesh, then a more nuanced and sensitive examination of dominant patriarchal ideologies and the sociocultural practices they inform is needed. This is an area where religious ideas and religious leaders can and do play a significant role (Adams 2016).

Bhutan

Overview of Country

Bhutan is a small landlocked kingdom located in the eastern Himalayas of South Asia. It lies between India and China, with a total land area of about 14,000 square miles (38,394 sq. km) and an estimated population of 720,679 (2012). The landscape stretches from subtropical plains and forests in the south bordering India, to subalpine forests and Himalayas in the north bordering Tibet in China. Bhutan is well-known as the "Land of the Thunder Dragon," derived from its Bhutanese name *Druk Yul*. It is said to have earned its nickname because of the fierce storms that often roll in from the Himalayas. Bhutan was the last remaining Buddhist monarchy in the Himalayas since 1907 until the country transitioned into two-party parliamentary democracy in 2008 (BBC 2017). The United Nations recognized Bhutan as a country in 1974.

Bhutan is known for having an extremely youthful profile in terms of its demographics where almost half the population of Bhutan, 45 percent, is under the age of 20. Women comprise 48 percent of the total population (National Statistics Bureau of Bhutan 2015), of which 69 percent reside in the rural parts of the country. According to the Population and Housing Census of Bhutan 2005, 31 percent of males are unpaid family workers, compared to

61 percent of the female population in the rural areas. The population density in Bhutan varies from rural to urban areas, given the increasing trend of internal migration. The urban population of the country is at 31 percent, and the remaining 69 percent of the population is rural. The population density of Bhutan is estimated at 41 people per square mile.

Bhutan is extremely rich in terms of natural resources, and it boasts an astounding volume of forest-covered areas and freshwater resources. It is the only carbon negative country in the world; 72.5 percent of its total land area is covered by natural vegetation that creates rich and diverse ecological systems. More than half of the total land area in Bhutan has been allocated as protected areas.

According to the Human Development Report (UNDP 2016), Bhutan ranks 132nd out of 188 countries in terms of the Human Development Index (HDI), with a value of 0.607 in the 2015 index. The Gender Inequality Index (GII) value for Bhutan in 2015 was 0.477, ranking it 110th out of 159 countries. Bhutan observed a 6.0 percent increase in HDI value between 2010 and 2015, from 0.572 to 0.607.

Bhutan is primarily an agrarian society, where 62.2 percent of the total population is involved in agriculture. A majority of the population earn their livelihood through subsistence farming and animal husbandry. Small-scale subsistence farmers occupy most of the arable land and produce the majority of the crop and livestock products for the country. According to the country's Labor Force Survey Report, the agriculture sector contributes 12 percent of the total gross domestic product (GDP) (Labour Market Information & Research Division, Department of Employment, Ministry of Labour and Human Resources 2012).

Despite the vast majority of people being involved in farming and the agriculture industry, Bhutan's growth has been inadequate in curbing the issue of poverty or food security in the country. Although agriculture remains a significant source of income and livelihood for the country, its contribution to the nation's GDP in recent years has been receding as people move away from traditional forms of livelihood, such as farming, and opt for a more modern lifestyle and occupations. This has also led to the feminization of the agriculture sector in Bhutan, where female figures are leading the farming industry in the absence of men (World Bank 2014a).

The tourism industry has emerged as an important source of revenue for the country in recent years. "Tourist arrivals and revenues (from convertible currency-paying tourists) expanded at an average of 15 percent per year in

the five years to 2013” (World Bank 2014a). This has led to rapid social and economic growth in the last two decades that has also ushered in mass and swift urbanization along with the socioeconomic transition in the country.

Bhutan has also witnessed rapid decrease in poverty rates from about 23 percent in 2007 to 12–13 percent in 2012, with only 1.6 percent extreme poverty, which is measured as less than USD\$1.25 per day in purchasing power parity. The rapid decline in poverty rates can be attributed to the modernization and commercialization of the agricultural industry; the rapid progress and development of rural infrastructures, such as health services, roads, and education; and the swelling number of hydro-related construction projects (World Bank 2014b).

Given the exceptional socioeconomic strides made by Bhutan in terms of poverty alleviation within an international context, it is transitioning toward the status of a middle-income country (MIC). Bhutan’s GDP per capita already amounts to USD\$2,584 in 2012, and it has positive growth of about 8 percent projected for the next five years, i.e., 2013–2018. Apart from the GDP growth, Bhutan has also achieved great success in meeting the Millennium Development Goals (MDGs) and improving the services and living conditions for its people. It has internalized seven out of the eight MDGs within its national policies, out of which it has already achieved four goals. It has successfully met the targets for poverty alleviation, achieving gender equality in education, ensuring environmental sustainability, and improving maternal health by reducing three-fourths of maternal mortality (National Statistics Bureau of Bhutan and World Bank 2014).

Girls and Teens

When it comes to the girls and teens of Bhutan, the country’s National Youth Policy (2009–2014) is of extreme importance both in mapping the concerns and challenges of these groups and in identifying strategies and measures to address the issues they face. According to Bhutan’s National Youth Policy, the official definition of *young people* in the country is people who belong to the age group of 13–24 years old. More than half the population in Bhutan, that is, 60 percent of its population, is below the age of 25, which represents tremendous possibilities for country’s socioeconomic development. With the advent of globalization and its growing impact in the changing socioeconomic landscape of the country, young people in Bhutan have new opportunities. However, one of the biggest

challenges for Bhutan continues to be youth unemployment. Substance abuse, physical and sexual abuse, violence, both unemployment and underemployment, and various health issues are some of the notable socioeconomic hurdles faced by the young people in the country.

Sexual and reproductive knowledge, health, and services for youth, especially young people and girls living in the rural areas, are challenges. According to Bhutan Multiple Indicator Survey 2010, the nation has one of the highest adolescent fertility rates, 59 births per 1,000 women ages 15–19, in the region, where 15 percent of girls give birth before the age of 18. Young girls and boys are sexually active from the ages of 16 and 15 years, respectively, whereby almost one-third of the HIV-infected population in Bhutan is 15–24 years old. Lack of information and knowledge about sex, lack of precaution and access to sexual and reproductive services and guidance, and unplanned sex have been attributed as the major reasons for adolescent pregnancy by the youth (UNFPA 2015).

The National Youth Policy sheds light on such matters and underscores the need for collaborative efforts in addressing these issues. It stresses the need for developing plans and policies for various youth-related programs coupled with effective implementation, monitoring, and evaluation plans for such initiatives. The policy also recognizes the diverse sets of experiences, needs, and socioeconomic positionalities of the young population within the 13–24 age group based on their location, education, marriage status, working conditions, and other dynamics. Based on the situational analysis and youth assessments conducted in 2005 and 2009, the national policy has identified various subgroups and priority target youth groups and recognized their unique, multifaceted needs that demand specific targeted policy interventions. The priority target youth groups emphasize improving and transforming the lives of youth, especially those who are vulnerable, such as unemployed and underemployed youth; domestic workers; young girls working in drayangs (dance bars); uneducated young people and those who have dropped out of school; young people engaged in substance abuse, drugs, alcohol, and risky sexual behaviors; young people living with a disability; orphans; young monks and nuns; and more (Department of Youth and Sports, Ministry of Education, Bhutan 2011).

Education

The education system in Bhutan can be categorized into three different areas: general education, which is the

formal education system, monastic education, and the nonformal education system. While the general education system is the dominant one in Bhutan, monastic education system which comprises of traditional form of monastic education and other non-formal education system are not as common as the general one. The general education system in Bhutan consists of 522 schools, out of which 486 are public schools which includes 51 central schools, and 36 private schools. Moreover, there are 96 extended classrooms (ECRs). The total enrollment from preprimary through high school (grade 12) within the country for 2016 was 169,560, with 9,081 teachers. At the tertiary level, there are 14 institutes, including two private colleges, with a total enrollment of 11,383 students. Adult literacy programs are offered to 7,236 learners across 674 non-formal education (NFE) centers throughout Bhutan. The NFE centers are facilitated by 682 instructors across the country. The net primary enrollment rate (NER) for 2016 was estimated at 94.7 percent, meaning that 94.7 percent of children 6–12 years old are enrolled in the primary education program. The adjusted net primary enrollment rate (ANER) stands at 98.6 percent, indicating that about 1.4 percent of the children are not receiving any formal education (Policy and Planning Division, Ministry of Education 2016). The Bhutanese education system provides free education from preprimary level until grade ten. The overall education system in Bhutan has also made great strides in terms of securing girls' Adjusted Net Primary Enrollment, which stands at 98.8% as compared to 97% for boys in 2016. Bhutan has also achieved full parity in terms of gender equity at the primary level with a gender parity ratio in favor of girls with 103 girls for every 100 boys. Unlike in the past years, it also was able to achieve equality within the enrollment figures whereby girls comprised 50.5% of the total school enrollment within the formal school education system for 2016. This has been largely attributed to the improvement that have been observed over the past years within the number of girls' enrollment at the lower levels of education (Policy and Planning Division, Ministry of Education 2016).

Despite the decline in gender disparity pertaining to education enrollment rates at the primary level, the inequality is very much visible at the lower and middle secondary levels and is even more pronounced at the secondary and tertiary levels. Such discrimination has a far-reaching impact on girls and their lives, as it prevents them from channeling opportunities that lead to higher education, employment opportunities, and their ability

to participate in the overall socioeconomic development process.

Despite the higher rate of primary school completion compared to males by females (86% for males vs. 93% for female) in Bhutan, due to poor retention and an increase of dropouts among girls, the rate for higher secondary-level school completion, which stands at an estimated 71%, is however higher for males, than it is for females. "Thirty-four percent of adult women have reached a secondary or higher level of education compared to 34.5 percent of their male counterparts whereas across all ages, 72 percent of males are literate, but only 55 percent of females are literate" (National Statistics Bureau of Bhutan and Asian Development Bank 2013).

The overall literacy rate of the country for the population 6 years and above is estimated at 63%. The literacy rate is higher in the urban areas at 79% as compared to its rural counterpart, which accounts for about 56%. The literacy rate is higher among the younger age groups, but the number plummets from the 10–14 age group, and the numbers are the lowest for the older population of 55 years and above. The literacy rate for the youth demographic (15–24) is 86%, and it is 55% for the adult (15 years and above). It is estimated that more than half the population (54%) is literate in both a local language and English, whereas 8% is literate only in a local language (National Statistics Bureau of Bhutan and Asian Development Bank 2013).

Overall, girls made up 50.5% of the total school enrollment for the year 2016 within the school education system in Bhutan. This is almost indicative of equal representation of girls at the higher secondary level, including private schools that had been unlikely in the past years. This can be attributed to the improvement in girls' enrollment, retention ratio, survival rate, and improvement in performance levels that have been on par with boys. Bhutan aims to eliminate gender disparity within literacy levels for both adult and youth groups from its education system (Policy and Planning Division, Ministry of Education 2016).

Bhutan has been rigorously promoting NFE programs in an effort to address the low adult literacy rates, which is especially high for women. Bhutan was also awarded the UNESCO Confucius Prize for Literacy in 2009 for its outstanding contribution and holistic approach to literacy and its success in reaching rural areas and adults through NFE programs. Since the initiation of NFE program by the National Women's Association of Bhutan in 1990, more than 140,000 men and women have benefited from it (GNH Commission 2010).

Despite the provision of equal education opportunities for children in Bhutan, inequities in completion of secondary education remain. Regardless of the existing socioeconomic class and structural inequalities, children in Bhutan are entitled to better and improving educational opportunities and infrastructures, such as those provided to the children of its neighboring South Asian nations. The government policy intervention that extends coverage for all and targets interventions with electricity and gas provisions has curbed inequalities among children to some extent. However, the issue of inequity in the completion of secondary education remains an issue where the inequality-adjusted completion rate was only 32 percent in 2012, with an adjusted attendance of 84 percent (National Statistics Bureau of Bhutan and World Bank 2014).

Health

Bhutan has made commendable progress in the health sector. The improving socioeconomic condition of the country, constitutionally mandated free health care services, effective and well-managed policies, and steady investment in the public health sector has contributed to the nation's overall health status. Bhutan signed the Alma Ata Declaration and integrated a primary health care approach within its health care system in 1978. This opened avenues for collaborative health practices between Bhutan's traditional medicine services and modern health care system that strongly focuses on community participation (WHO 2017).

Extensive immunization programs have resulted in a significant decrease in vaccine-preventable diseases, with zero incidence of poliomyelitis since 1986. Bhutan has also achieved some noteworthy public health victories and has successfully eliminated endemic goiter and leprosy, visibly reduced the maternal and infant mortality rates, and curbed the number of deaths due to major communicable diseases, such as tuberculosis (TB) and malaria. The average life expectancy of the country has notably increased from 37 years in 1960 to more than 68 in 2012, whereas the mortality and morbidity rates have largely decreased. Bhutan has placed a great emphasis on access to safe drinking water and basic sanitation and has substantially increased the coverage for those services.

Despite the milestones achieved in terms of general health of the people, new challenges emerge with the growing population and changing demographics coupled with unplanned and rapid urbanization, epidemiological and

environmental transitions, and changing trends within the lifestyle of the people. Nevertheless, Bhutan has met several health indicators and targets set within the MDGs and has opted for the Sustainable Development Goals (SDGs) that succeed the MDGs beyond 2015. The country's 11th national five-year plan highlights the development and strengthening of health care systems and formulating cost-effective interventions as a key priority (WHO 2017).

Access to Health Care

The health infrastructure in Bhutan has been strong with its impressive multitiered health system in place. The JDWNRH national referral hospital in Thimphu, Yebilabsta, in the center of the country and Mongar in the east are the top health institutions in the country. There are 26 other hospitals, most of which are located in the district headquarters. There are 158 basic health units (BHUs) under these hospitals, where 439 outreach clinics are run by the health personnel. BHUs in Bhutan are categorized into grades I and II, where a grade II BHU consists of three health assistants and a grade I BHU also has one doctor and nursing staff in addition to the health assistants. Out of 158 health units, only 10 are classified as grade I. In the remote areas where the closest health center is more than a two-hour walk from the village, they have a volunteer village health worker. An estimated 1,300 volunteer health workers are providing basic health care services in rural areas of Bhutan.

In cases of complex health issues and treatments where the national health services are unable to adhere to the health needs of the patients, Bhutan's national health care system conducts referrals to neighboring countries, such as India, and overseas. For other health services, the health facilities and professionals in the country, especially the outreach clinics, have been successful in reaching out to the majority of the population. In 2000, an estimated 78 percent of the villages in Bhutan had access to a health center within a walking distance of two hours and 89 percent within three hours. Four percent were beyond six hours of walking distance in terms of access to health service (UNICEF 2006). Considering the tough terrains and challenging geographical structures of the country, where roadways and transportation are not connected to the remote villages, Bhutan has achieved notable progress in its health care system. Also, the fact that almost all basic health services in Bhutan so far have been free of cost makes Bhutan one of the few developing countries

to maintain such an extensive free service. Essential drugs are widely available in the basic health units (BHUs) throughout Bhutan.

Bhutan also gives importance to its traditional health practices and remedies and promotes So-Wa-Rigpa, which is an indigenous health practice that uses several species of Himalayan flora. The majority of the people who inhabit the rural areas of Bhutan have faith in traditional healers and lamas and reach out to them first when in need of health services and counseling. Some of the district hospitals also offer traditional medicine and specialize in traditional remedies and healing (UNICEF 2006).

Maternal Health

Women in Bhutan, especially in rural areas, face specific health challenges. As they cook on open fires in kitchen rooms with poor ventilation, they are vulnerable to various chronic lung diseases. Access to drinking water, health services, and other basic facilities may not be easy where they have to walk long distances on a daily basis, which leaves them strained. Women also do the majority of household chores and either work in agricultural fields or their respective occupations, which means that they tend to work longer hours than men on an everyday basis.

Gender equality and women's empowerment have played a key role in promoting and ensuring reproductive health care to women in Bhutan. However, women still face health risks that are related to pregnancy and childbirth. The contraceptive prevalence rate (CPR) is higher among women with low socioeconomic status. Rough geographical terrain and unequal socioeconomic status also prevent certain women from having access to skilled birth attendants. Given that 55 percent of women are anemic, poor nutrition is another major issue when it comes to pregnant women and mothers. Despite the provision for free health care services, Bhutan now needs to strategize around addressing the issues of quality health services and improving access and equity to all population groups (World Bank 2014b).

Reproductive Health

In Bhutan, adolescents (ages 10–19) and youth (ages 20–24) make up a larger proportion of the population. The population of young people aged 10–24 years constitutes about 56 percent of the total population. While this young population is often heralded as the future and torchbearers of the nation, they also face unique emotional and physical

challenges related to health, sexuality, education, employment, and more.

Some of the pressing issues they face are substance abuse, teenage pregnancy, early marriage, sexually transmitted infections, low use of contraceptives, and lack of access and knowledge on sexual and reproductive health. Although unmarried young people can use those services, the reproductive health services and facilities that are available in the country are primarily targeted for married couples.

“However, only 17 percent of the youth population has comprehensive knowledge about HIV and AIDS whereas 90 percent of people living with HIV contracted the infection through sexual transmission. For every 100,000 live births, 180 women die from pregnancy-related causes; and the adolescent fertility rate is 44.9 births per 1,000 live births” (National Statistics Bureau of Bhutan 2015).

Employment

According to the *Bhutan Living Standards Survey 2012 Report* (National Statistics Bureau of Bhutan and Asian Development Bank 2013), the estimated unemployment rate is 2.7 percent. Compared to the rural areas, where the unemployment rate is at 1.6 percent, urban areas have a higher rate of unemployment, with a rate of 5.8 percent.

The youth population of Bhutan comprises the largest unemployed demographic; 7.3 percent of young people reported unemployment in 2012, whereas the figure was double in the urban areas. Female participation in the labor market is 65.8 percent, and it is 76.4 percent for men. Almost half the population of Bhutan, 48.9 percent, is under the age of 25, making youth the majority. The issue of youth unemployment is garnering attention within the government, private sector, civil society, and particularly among young people who are looking for ways to engage in constructive dialogue and collaborative measures to overcome the issue at hand (National Statistics Bureau of Bhutan and Asian Development Bank 2013).

Women's opportunities for employment outside the home in Bhutan are limited due to household responsibilities assigned to them and their relative lack of education. Women's labor force participation is significantly lower than that of men, particularly in urban areas. Women usually fill the low-skilled and low-paid jobs in the country. They hold less than one-quarter of the positions in civil service and are largely sidelined within government jobs, which has resulted in limited opportunities and

participation of women in decision-making and national planning positions. Similarly, women's participation in politics is also very low, with a very few women members (*tshogpas*) elected on the district development committees. Only four female members have been elected to the National Assembly.

Bhutan's late start in terms of education for girls in general is attributed as one of the leading causes for the employment disadvantage that women face. Although young girls and women in Bhutan are making progress, breaking stereotypes, and setting examples within educational and professional avenues, the improvement in the overall situation of women has been slow. A traditional mind-set and patriarchal values are still very much palpable within Bhutanese society, which conditions young girls to have low expectations for women (UNICEF 2006).

Family Life

The idea of family in Bhutan is subtle and extends beyond a family unit or nuclear family, encompassing not just the concept of extended family but also community, village, and neighborhood. In Bhutan, people are accustomed to relating to their friends and neighbors with care and interest and a family-like intimacy that permeates every facet of Bhutanese society. The concept of family evokes a sense of security and well-being among Bhutanese people that ties directly into their enjoyment of happiness. Bhutan's strong sense of history, culture, religion, and the nation as a whole is very much embedded within and dependent on family structures that are still intact in Bhutan. Family is considered one of the most significant social institutions and is directly tied to culture, governance, and environment. Family is looked upon as an active working unit, which is believed to be a major factor in reinforcing and maintaining the country's stability (Leaming 2010).

In Bhutan, people are believed to have a single-minded national identity that is part of their sense of "family." The typical Bhutanese family is large and includes interdependent and intergenerational extended families. Their social structure and religion deem that they take care of each other. Historically, a key element of family life was the availability of labor within extended families. However, this is changing with rural to urban migration and the "Westernization" of families, as they then tend to become independent and nuclear. However, such family structures are still not as dominant as the traditional extended family. Families are believed to contribute to overall "natural"

happiness in Bhutan. The government's multidimensional approach to development is aimed at "spiritual and material balance and harmony," which is believed to perpetuate and expand on their natural happiness.

Despite the existence of matrilineal inheritance and the fact that 30 percent of Bhutanese households are headed by females, the patriarchal family structure is still palpable and is the dominant form of family life in Bhutan (National Statistics Bureau of Bhutan and World Bank 2014). However, it is not uncommon for men to partake in household chores. Bhutanese essentially practice monogamy, which is classified in three popular categories: childhood engagement (*chung ngen*), arranged marriage, and love marriage. The popular traditional practices of childhood engagements and arranged marriages were based on family and ethnic ties and are slowly being replaced with relationships based on mutual love and affection today. The marriage custom does not necessitate the bride to start living in the bridegroom's house, unlike the majority of South Asians practice. It is entirely circumstantial and depends on the preference and convenience of the families of each household. Hence, it is not uncommon for a new husband to leave his house and start living in his wife's house.

Politics

The political scenario of Bhutan has progressed over time along with its traditions, culture, and values. Bhutan's ruling paradigm changed when the transition from absolute monarchy to constitutional monarchy happened in 2008. Bhutan did not have national currency, telephones, schools, hospitals, a postal service, or public services until the 1960s. In 1961, His Majesty King Jigme Dorji Wangchuck, the third monarch of Bhutan, took initiatives to end the self-imposed isolation of Bhutan and launched the country on the path to modernization. Bhutan's democratization process has steadily progressed since then.

The final draft for the country's first democratic constitution was made in August 2007; it formed the foundation and resolutions for the elections that were carried out in 2007 and 2008. After a serious and thorough debate, the new democratic constitution was enacted by the newly elected Parliament in 2008. It was signed by the king on July 18, 2008. The constitution not only ensures that Bhutan is a democratic country within the international community, but it also takes into account Bhutan's unique cultural and historical heritage. The fundamental civil rights for all Bhutanese citizens are clearly stated in the constitution.

Equal justice under the law and free education for all children are highlights among other civil rights. Access to further education based on qualifications is clearly specified in the constitution as well.

The constitution appears to be ideal and as having no significant inadequacy, but it includes provisions that are not often seen. For example, the age limit for the king's retirement is 65 years, and capital punishment is prohibited. The most unique provision protects the environment by requiring that a minimum of 60 percent of Bhutan be covered by forest at all times. The government consists of the legislature, judiciary, and executive bodies. The legislative body is composed of the ruling political party, the opposition, and the National Council.

The July 2013 primary elections evolved the second democratic process, with multiple political parties participating in elections for the lower house. The Country Policy and Institutional Assessment (CPIA) rates and international measures of governance and corruption of Bhutan are quite good. Bhutan ranks 31st among 177 countries and scores better than Israel, Spain, and Poland in terms of corruption perception. The increase of Bhutan's comprehensive integrity score in recent years reflects that the domestic perception of corruption is on the decline.

Upholding gender equality and empowering women has been one of the most important issues and an integral crosscutting development theme within the Royal Government's development agenda. The commitment for gender equity is included in the country's Vision 2020 and the current Tenth Five Year Plan. Despite the gaps in achieving complete gender equality, women in Bhutan have enjoyed a considerably better status compared to women in other developing countries. The constitution endorsed in 2008 upholds the principle of equal pay for equal work, which guarantees equality in work for all citizens, including women. In addition, it contains special provisions to abolish all forms of discrimination and exploitation against women, which includes prostitution, trafficking, abuse, harassment, violence, intimidation, degrading treatment, and economic exploitation. Furthermore, statutory laws do not allow any sort of discrimination against women in terms of property rights and family law. These laws also protect them from crimes of sexual assault, rape, domestic assault, and molestation (GNH Commission 2010).

Despite the fact that Bhutan has achieved gender parity in primary and secondary schools, there is still need for improvement and upgrading in tertiary education. In terms of the Gender Inequality Index (GII), Bhutan ranks

110th out of 159 countries, whereas the female participation within the labor market of the country stands at 58.7 percent compared to 72.8 percent for men (UNDP 2016).

The law protects the rights of women in Bhutan, and women are treated as equal to men. Women enjoy the same legal rights as men and have equal access to education, health facilities, and other public services. In rare cases, women can be seen holding a stronger position than men, especially in western and central Bhutan, including some parts of the east. In some areas of Bhutan, a matrilineal form of family system is still in practice, where land is inherited through the mother; as a result, 60 percent of rural women hold land registration titles. Given that the most capable member of the family is in charge of the family in Bhutan, the mother or the eldest daughter also has the opportunity to become the head of the household. Women are also seen to be in charge of the family, especially in the absence of their male counterparts when they migrate to urban areas in search of works.

Thirty percent of families in Bhutan are headed by women. However, there is disparity between male-headed and female-headed households in terms of status, privilege, and growth. Irrespective of the matrilineal inheritance and a nondiscriminatory labor market, women who are leading families and households continue to face livelihood disparity. This results in uneven and disproportionate household work for women, which reduces their opportunities (National Statistics Bureau of Bhutan and World Bank 2014).

In comparison to its neighboring countries in South Asia, Bhutan practices relatively more equality between men and women within the household, as both men and women partake in the domestic chores. Such shared household responsibility has been an integral part of Bhutan's self-sufficient, traditional lifestyle. Nevertheless, it is women who do the majority of the household work, and despite their relatively high status, they have yet to achieve full equality. Women in Bhutan face both overt and subtle forms of gendered discrimination, which is reinforced by traditional mind-sets and religious values regarding women's sexual vulnerability and the lesser competence and capabilities they possess compared to men. Some religious Buddhists also believe that by the virtue of their sex and gender, women are further away than men from attaining enlightenment in the cycle of rebirth. Although Bhutan marvels at the fact that women within their nation enjoy greater gender equality and higher status compared to other countries in the region, women and their

contributions are still considered as mediocre and lesser in comparison to men (UNICEF 2006).

Bhutan signed the Treaty for the Rights of Women and ratified the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) in 1981. In addition, it has adopted many strategies and formulated plans, policies, and programs to address the issue and expressed its commitment to gender equality. While any form of explicit discrimination against women has not been observed, there are gender gaps and issues related to unequal access to economic opportunities and limited participation in decision-making processes that still require attention. Men dominate the public service sector, with only 26 percent of women involved in civil service. In 2015, only 8.3 percent of the members of Parliament were women. Women's exceedingly low and weak representation in decision-making bodies within the government, parliamentary bodies, and cabinet positions, including civil service, calls for a transformation within the sociopolitical systems of the nation (UNDP 2016).

Religious and Cultural Roles

Bhutan is a deeply spiritual country and the last remaining Buddhist kingdom in the world. The influence of Bhutan's rich cultural heritage and highly valued relationship with nature is embedded and visible in the everyday lives of the people. Its pristine environment and untainted and harmonious culture have made the country renowned as "the Last Shangri-La."

Buddhism has a great influence on Bhutanese culture. The majority of the population follows Buddhism, and the remaining minority follows Hinduism. There are numerous sacred Buddhist stupas, monasteries, and temples across the country. The country places a strong emphasis on Buddhist teachings, and Bhutanese receive free education from the government.

Bhutan's pristine and authentic culture allures people from all over the world. Bhutan has managed to preserve its cultural authenticity and rich heritage through years of isolation. People in Bhutan wear traditional dresses to work; men wear *gho*, and women wear *kera*. They speak the local languages, Dzongka and Sharchop. The country is replete with native Dzongka-style architectural features and buildings that are inspired by Buddhism.

Tsechus, or festivals, in Bhutan are very important and major cultural events where people come together and celebrate the festivity. Most of the *dzongs* (fortresses) and

goembas (monasteries) have annual festivals featuring mesmerizing dance dramas. The largest of these festivals is the *tsechu*—with dances in honor of Guru Rinpoche. Festivals in Bhutan are very grand and colorful and are an integral part of Bhutanese life. It offers a unique insight into the cultural legacy of Bhutan. The festivals include masked dancing with colorful and bright costumes and performances of wrathful and compassionate deities, heroes, demons, and animals (Tourism Council of Bhutan).

Tourism

Closed off from the world for decades, Bhutan has only allowed tourism since 1974. Bhutan is considered one of the most exotic travel destinations in the world, replete with rich culture, tradition, and pristine natural habitat. The Royal Government of Bhutan strongly adheres to the policy of "High Value, Low Impact" tourism, and it regulates the tourism industry by limiting the number of tourist admissions in the country, which further adds to the allure of Bhutan's exclusive and mysterious profile. Although the total volume of international tourists for Bhutan is extremely small, it enjoys a high profile within the global tourism industry and is often regarded as one of the most sought-after tourist destinations in the world.

Bhutan is the only country in the world to impose constitutional obligations on its people to protect the natural environment by requiring that at least 60 percent of its land remain under forest cover at all times. Given its strict policies in terms of environment conservation and protection, Bhutan has been successful in safeguarding its natural resources and environment. This has earned Bhutan a record for being the only "carbon-negative" country in the world, which means it emits more oxygen (O₂) than carbon dioxide (CO₂). Bhutan has set a new standard for environmental conservation today and is looked upon as the world leader when it comes to environmental protection and sustainability.

Tourism also plays an integral role in terms of employment opportunities, revenues, and foreign exchange; it is a vibrant business that is rapidly growing service sectors for Bhutan. In 2016, a total number of 209,570 international tourists visited the country, which contributed US\$ 73.74 million to the country's economy. This marks an increase of 4% from 2015 where the country had secured US\$ 71.05 million from tourism industry (Tourism Council of Bhutan, 2016). Tourism is also considered a key factor in driving the country's efforts and commitments to promote

and protect the local environment, culture, tradition, and diversity of the country. It highly emphasizes the practice of sustainable tourism and a reduced carbon footprint. By promoting community-based tourism and ecotourism, Bhutan strives to support local communities and create sustainable economies in the rural areas. While this tourism approach aims to reduce the poverty in remote areas of Bhutan, it also helps to promote environmental conservation, sustainability, and awareness within those communities (World Bank 2014a).

Although tourism in Bhutan has opened avenues for self-employment and additional income for local communities, it is usually the male figures who directly benefit from the revenue generated from this sector. It is mainly the men who are in the forefront of the tourism business in Bhutan, from hotels and restaurants to local guides, porters, and vendors.

Gross National Happiness

As opposed to gross domestic product (GDP), a parameter widely adopted across the world to gauge the economic and living standards of a country, Bhutan practices the concept of Gross National Happiness (GNH). The term was coined by the fourth king of Bhutan, Jigme Singye Wangchuk, in the 1970s and is still prevalent in Bhutan. The concept of GNH was built on the idea that sustainable development should adopt a holistic approach in its definition of progress and encompass noneconomic aspects of well-being as well. Bhutan has identified four key elements, or pillars, of GNH: equitable and sustainable socioeconomic development, preservation and promotion of cultural and spiritual heritage, environmental conservation, and good governance. These four pillars have further been distributed into nine areas, which comprehensively incorporate the issues of health, education, living standard, governance, cultural and ecological diversity, community vitality, and so on. Each of these areas lays out the parameters of well-being and happiness for a good life, per the principles of GNH for the Bhutanese people.

Issues

Poverty

Bhutan has made noteworthy improvements in reducing income poverty, as estimated by the percentage of the people living below the national poverty line. According to the World Bank, the poverty rate has been on decline,

decreasing from 36.3 percent in 2000 to 23.2 percent in 2007. Given the facts, it is apparent that the country is on track toward meeting its poverty reduction targets. This economic improvement in people's lives in general is an indication of rapid economic growth that is made possible by effective redistributive programs, including sustained social investments. Even after the significant growth over the past few years, poverty still continues to be a principal rural crisis, with 98 percent of the poor residing in rural parts of the country. This situation is intensified by the human poverty conditions and comparatively poorer access to social and economic services in the rural parts of the country (World Bank 2014a).

Referring to the report "Bhutan Poverty Analysis 2012," 12 percent of the current population lives below the national poverty line, 30 percent of the population lives in the urban areas, and 70 percent lives in the suburban and rural areas. The report also indicates that the poverty in rural areas is 16.7 percent, in contrast to the urban poverty at 1.8 percent. Inadequate agricultural productivity; access to alternative businesses, markets, and commerce; communication and road infrastructure; and the effect of rural-to-urban migration have been attributed as the reasons for the higher prevalence rate of poverty in rural areas. The issue of poverty is also gendered and has far-reaching effects on women, especially in rural and traditional families. The disproportionate responsibility of family obligations and household chores, including child care, by women significantly augments their impoverished state, as it restricts their opportunities and choices to engage in remunerated or skilled labor.

Refugee Crisis in the South

Bhutan is a diverse country in terms of its people and ethnicity. There are four main ethnic groups in Bhutan: the Ngalong, who inhabit the western part of Bhutan; the central Bhutanese; the Sharchop in the east; and the Lhotshampa, also known as the Nepali Bhutanese, in the south. The Buddhists in the north, also known as the "Drukpas," enjoy a privileged and elite status compared to the Nepali-speaking southerners who are Hindu. The Lhotshampas in Bhutan are mostly Hindus and are a minority group who migrated from Nepal to the southern part of Bhutan following the Anglo-Bhutanese war of 1865. The Lhotshampas are the progenies of peasant farmers from Nepal who first settled in the southern region of Bhutan and subsequently formed agrarian communities there (Hutt 2005).

During the 1980s, the ruling Drukpa elites perceived the Lhotshmapa people as a threat to their national political, religious, and social order and took measures to contain them and their democratic movements by imposing a homogeneous national identity with state policies and mechanisms, such as the 1985 Citizenship Act—the One Nation, One People policy. When a string of measures were passed that directly discriminated against their group and rendered them stateless and denationalized, the Lhotshampas organized mass protests and public demonstrations in resistance and opposed such discriminatory policies. As a result, they were vilified and regarded as “antinationalists” by the government. Following the demonstrations, the government imprisoned and tortured thousands of people from southern Bhutan. As a result, most of the Lhotshampas were compelled to escape the country and sought refuge in neighboring countries, such as India and Nepal. By the end of 1992, it was estimated that more than 100,000 people were living in UN refugee camps located in the southeastern part of Nepal.

“Such mass ethnic cleansing caused civil unrest and conflict in the south which led to the mass exodus of more than tens of thousands of people who have been living in refugee camps in Nepal since the early 1990s” (Hutt 2005). The displacement of more than 100,000 Lhotshampas is one of the largest in history, accounting for about 20 percent of the total Bhutanese population at the time. It was only in 2007, after 16 years in refugee camps, that resettlement initiatives by the UN refugee agency and the International Organization for Migration (IOM) in Nepal launched a resettlement program for the Bhutanese refugees. It has relocated over 100,000 Bhutanese refugees from Nepal to third countries since the launch of the program. A core group of eight countries came together in 2007 to relocate Bhutanese refugees in their respective countries: Australia (5,554), Canada (6,500), Denmark (874), New Zealand (1,002), the Netherlands (327), Norway (566), the United Kingdom (358), and the United States (84,819) (Shrestha 2015).

Women and girls are even more vulnerable amid the refugee crisis because they are susceptible to gender-based violence, discrimination, sexual abuse, and exploitation. Instances of rape, sexual assault, polygamy, trafficking, domestic violence, and child marriage within the refugee camps have been reported by Bhutanese refugee women and girls. Adhering to sexual and reproductive health needs, preventing sexual violence and abuse, and providing services to survivors under a crisis situation like this become

even more crucial and challenging. Refugee women also reportedly faced systematic discrimination in accessing aid because of discriminatory practices in terms of refugee registration procedures and a lack of protection for women. Married refugee women were not eligible to apply for repatriation or rations independently. Furthermore, they were barred from registering their children if they were not fathered by a refugee. Such systematic and legal barriers further marginalize refugee women and deny them their agency and independency. They were denied from having independent access to basic needs such as food, shelter, and supplies in the absence of their spouse, which posed even more challenges to those who wanted to separate from their husbands to end their abusive marriages. They were left with no choice but to live in their abusive relationships or to marry another man, which meant losing the legal custody of their children (HRW 2003).

C

Cambodia

Overview of Country

Cambodia is an agricultural Buddhist country located in the southwestern region of the Indochinese Peninsula in Southeast Asia, nestled between the countries of Laos, Vietnam, Thailand, and the Gulf of Thailand. It borders the Gulf of Thailand to the south, Laos to the north and north-east, and Vietnam to the east and the southeast. Cambodia is also bordered by the Mekong River and the Tonle Sap Lake. It covers a region of approximately 69,000 square miles (81,035 sq. km). Cambodia has a tropical climate largely defined by two distinct seasons, the wet season (May–October) and the dry season (November–April).

In 2014, the United Nations ranked Cambodia 136th out of 187 nations based on the country's Gender Inequality Index (GII, 0.505).

Any study of rankings and trends in Cambodia must take into account the various impacts of the Khmer Rouge genocide between 1975 and 1979. During that time, more than one-quarter of the entire Cambodian population (an estimated 2 million out of a population of 7 million at the time) was killed in the Khmer Rouge's brutal attempt to create a utopian state. The regime killed anyone who was urban or educated, favoring poor, uneducated farmers as personified ideals of the new social order and destroying virtually all symbols of the West. The Khmer Rouge was

equally ruthless in its violent treatment of females and males. Thus, in the postconflict decades, there has been a sharp increase in the average life expectancy, from just 38.7 years in 1980 to 71.9 years in 2014.

Once a vast empire dating back to the early ninth century, Cambodia eventually deteriorated over time and was ultimately nearly destroyed by neighboring Thailand and Vietnam before being colonized by France in 1863. At that time, Cambodia, Laos, and Vietnam became a protectorate known as French Indochina. In 1953, under King Sihanouk, Cambodia obtained independence from France. Cambodia's political system is a multiparty democracy under a constitutional monarchy. Cambodia's first general elections were held in May 1993, with the focus of establishing an elected government within the framework of the constitutional monarchy. Since then, the Royal Government of Cambodia has been trying to rebuild its technical and human capacity, with mixed results. Hun Sen has been prime minister since 1993.

Ninety percent of Cambodia's population is ethnically Cambodian, and 95 percent of Cambodians practice Theravada Buddhism. Khmer is the official language, and some Cambodians, particularly young people in urban areas, also speak French, English, or other languages.

According to the 2008 Cambodian general census (NIS 2008), the population is estimated at 13.4 million, with a ratio of 51.36 percent females to 48.64 percent males. Approximately 28 percent of the total population lives

Yorm Bopha

Since 2012, Cambodian land rights activist Yorm Bopha (1983 –) has been one of the key representatives of Boeung Kak community members during their anti-eviction demonstrations in the capital of Phnom Penh. In preparation for filling in and developing Boeung Kak Lake, the Royal Government of Cambodia forcibly evicted more than 4,000 people living on and around the lake over the course of two years. Following the detention of several Boeung Kak protestors, Ms. Yorm was threatened by police for continuing the work of opposing the unjust land grab. She was later arrested along with her husband and brothers. However, she was not arrested for protesting; she claims that she was framed by authorities for an assault that she did not commit. In June 2016, Yorm was retried and reconvicted for the alleged conviction after serving 14 months in prison, but the court suspended the remainder of her three-year sentence. She continues to protest the unlawful eviction of her community, as well as demand the release of other housing and land rights activists who are still imprisoned.

below the poverty line. Cambodia has a young population; 61 percent are younger than 24 years old (NIS 2010). Individuals under 39 years of age make up 76.7 percent of the population (NIS 2008).

Cambodia is in a state of uncertainty as it continues to stabilize itself socially, politically, and economically. Social and political issues—such as sexual violence against women, political corruption, and unequal access to education and employment—continue to plague the country. Until Cambodia resolves some of these internal social problems, it will be difficult for the country to thrive in the globalized economy.

Girls and Teens

The 1993 Cambodian Constitution “gives equal chances and equal benefits to all Cambodian women and men as its main concept to promote equality.” It further asserts, “The law gives equal rights to women and girls, but often they cannot obtain these rights due to their situations and traditional cultural beliefs and practices.” Cambodia’s “gender problem” is not only a cultural tradition; it is created and reinforced by social, political, economic, and other institutional mechanisms that determine the ways in which Khmer women are socialized, educated, and

professionalized. Although tradition and culture contribute to gender formation in Cambodia, equally important is the degree to which the post-Khmer Rouge society as a whole is systemically antagonistic to feminist empowerment and agency.

Jbab Srei: Law or Moral Code of Behavior for Females

The gender problem in Cambodia, in many respects, stems from the cultural expectation of *jbab srei* (the “law”—literal translation— or moral code of behavior for women). Though not enforced in any legal sense, all Cambodian women are expected to respect and abide the rules of *jbab srei*. This behavioral code directly or indirectly defines everyday identity and life for Cambodian women of all ages. By following this code, a Cambodian woman will be honored as “real and pure,” and as a result, it is thought that she will likely live a happy life in this lifetime and in the afterlife. Women who fail to follow this code are viewed negatively by other Cambodians and will likely be unhappy in this lifetime and in the afterlife.

Jbab srei says that, for all women, there are three important rules to follow, and not following them could lead to problems: (1) be respectful to parents, listen and follow their wishes, take care of them, and serve them good food;

(2) be respectful and faithful to your husband throughout your lifetime with him, keeping in mind that your husband is always superior—do not disappoint him; and (3) do not bring problems from outside the house into the house, and, similarly, do not share your personal problems at home with others.

Jbab srei is divided into two main parts, one for single women and one for married women. Each part has slightly different rules. The rules for single women include being respectful of parents; socializing and being kind to relatives and neighbors; not being stupid or silly; not being selfish and cheap; being serious when talking to others; not being aggressive in approaching a male, so he will be able to avoid taking advantage of the situation; working hard and focusing on jobs, such as sewing and knitting; not doing more than one thing at a time; and not spending time fooling around with others but, instead, spending time working hard, as once a woman is married she will have less time for herself (and more time for her husband and children). For married women, *jbab srei* includes the following: always be respectful to husbands; be patient and calm; avoid getting angry or yelling back after the husband initially yells; and use polite words toward husbands at all times.

The behavioral expectations from *jbab srei* are consistent with research by Ledgerwood that focused on how women are ranked within the social strata and evaluated based on their ability to fulfill cultural standards. In other words, women exhibit their high status through “proper” behavior and demeanor. Women are expected to walk and speak softly and slowly as well as to manage the family and household budget and serve as a confidante and adviser to her husband while attending to his every need.

A 2006 study by Nou of the psychosocial adjustment of Cambodian refugees in Massachusetts also found that men and women believed women were more likely to suffer from mental health issues. Cambodian culture expects women to be silent about personal and family issues and to take full responsibility for the entire family’s well-being. All the respondents in that study agreed that women suffer more stress than men because of men’s alcoholism and infidelity and because of domestic violence inflicted by Cambodian men on their wives. They further pointed out that women are usually expected to be tolerant of abuse (both emotional and physical), while men are expected to provide for the family financially. What this research shows is that, despite geographic boundaries from resettling in the United States, the mores of *jbab srei* still strongly resonate among Cambodians today.

A Cambodian woman’s social status is influenced by a wide range of different factors, such as wealth, family reputation, political affiliation, employment, her character, and her religious devotion, in addition to how closely she follows the *jbab srei* code of behaviors.

Gender Inequity

Despite changing gender attitudes in contemporary Cambodia, some significant gender inequalities and disparities have widened. *The Global Gender Gap Report* (WEF 2013) provides a comprehensive review of the status of women worldwide and shows that there are gaps between Cambodian women and men across key areas of health, education, economics, and politics. Compared to other countries, Cambodia consistently scores low in the categories of economic participation and opportunity, political empowerment, educational attainment, and health and survival.

Many critical issues facing Cambodian girls and women can be explained, in part, by discriminatory attitudes and practices that subject females to different types of abuses. These include emotional, psychological, and physical abuse, as well as human trafficking and other types of human rights exploitation. According to the 2011–2015 UNFPA report, Cambodia has the *lowest* levels of gender equity in Asia as measured by the Gender-Related Development Index (0.567 in 2005) and the Gender Empowerment Index (0.364 in 2005). This is mainly due to women’s extremely limited access to health and education services, employment opportunities and decent work, and land-ownership and other property rights.

The same report also notes that the prevalence of gender-based violence (GBV) compromises the health, dignity, security, and autonomy of women and girls in Cambodia. Incidences of domestic violence are high, affecting almost a quarter of all Cambodian women. Twenty-two percent of women have experienced physical violence since the age of 15. Because of GBV, the Committee on the Elimination of Discrimination against Women (CEDAW) recommended “a comprehensive assessment of the prevailing traditional code of conduct so as to identify those elements that discriminate against women and are the root causes of women’s disadvantaged position in areas such as education, employment and public and political life, and are determining factors in the prevalence of gender-based violence” (2006, 10).

Key findings from UNFPA intersect with a 2013 report on gender equality in Cambodia by the Asian Development

Bank (ADB 2013), which highlighted that traditional attitudes toward women have a profound effect on the labor market. Because women have traditionally been regarded as lower status compared to men, this has resulted in gender inequality and perpetuates disparities in employment. Even though culturally defined behavior norms for women limit their opportunities outside of the household, economic, social, and political improvements have opened up new prospects for women. As a signatory to several international agreements, including the Convention on the Elimination of All Forms of Violence against Women (CEDAW), Cambodia has taken some preliminary steps toward providing new opportunities for women, but far more work remains to be done (see Issues, below).

Gender Roles in the Home Economy

Unlike other Asian cultures, Cambodian families provide women with a relative degree of independence. For practical purposes, Cambodian women have a lot of power within the family unit. They are tasked with multiple, meaningful responsibilities, including financial matters and household management, as well as related work necessary to maintain the health and well-being of the entire family. Females are expected to maintain a harmonious family environment and to be effective at resolving family conflicts.

Traditionally, Cambodian women have the legal right to own and inherit property, and they have a record of active participation in both business and commerce. Less equality between the sexes exists in the cities than in the villages, where gender roles are relatively more flexible due to the shared division of labor in agricultural production. Nevertheless, specific labor tasks tend to be restricted almost exclusively to males (such as plowing the land) or to females (such as caring for children and cooking).

Education

Historically, much of the social and institutional structure of Cambodia was centered on Buddhism. As such, the village *wat* (temple) was considered the center of most educational and social activities. Under French occupation (1863–1953), all education up to the university level was offered almost exclusively at the village *wat* and was a privilege most commonly granted to boys. For a short period of time after independence, elementary education continued at the *wat* and higher education took place at government

schools. Today, all formal education takes place in both private and public educational institutions.

According to the *Cambodia Demographic and Health Survey 2014* (National Institute of Statistics, Directorate General for Health, and ICF International 2015), or CDHS, 47 percent of women and 42 percent of men have attained some primary education. The statistics on secondary education are conflicting. The CDHS states that 52 percent of men and 40 percent of women completed secondary or higher education. However, the United Nations (UNDP 2014) notes that, among Cambodians over 25 years of age, 22.17 percent of men and 18.1 percent of women have “at least some secondary education.” As of 2016, 6 percent of men and 13 percent of women had no formal education. In 2013, the *Asian Development Bank Gender Equality Labor Market Report* (ADB 2013) revealed that, in 2011, there was a 15 percent gender difference in basic literacy between men over the age of 15 (88%) compared to women (73%), noting that the disparity was greater in rural areas. The same report also stated that, based on 2011 data, there was a 17 percent gender disparity between men (59%) and women (42%) who had completed at least primary education. The report also highlighted enrollment rates in primary education, which are virtually identical between the sexes and should eventually reduce constraints on girls and young women wishing to enter the job market.

Enrollment rates for girls and boys in lower and upper secondary education in Cambodia increased considerably during the 2000s, but they are low compared to other countries. Social norms and poverty keep many children, particularly girls, from pursuing secondary education. Girls are less likely than boys to obtain education, partly because of having to do household chores or care for their siblings or contributing to the family income. As in many cultures, the education of boys is valued more highly than the education of girls.

The CDHS (National Institute of Statistics, Directorate General for Health, and ICF International 2015) indicated that there is a disparity between men and women in specialized and vocational training and tertiary education. Compared to men, women are more likely to participate in training programs for shorter periods, and the jobs they pursue training for often reflect gender stereotypes, such as domestic and caregiver positions.

According to the UN Population Fund report (UNFPA 2010), the lack of investment in educational programs, such as early childhood education—and parent and community engagement in these programs—is a point of

particular concern in Cambodia. Access to education at all levels is unevenly distributed in the remote rural areas where a majority of Cambodia's poor live. Costs associated with informal fees (often expected by corrupt teachers or other education professionals) continue to be a barrier for the poor, and conflicts of interest and favoritism between high-ranking university administrators and influential politicians are common. In addition to the rural poor, students who are older than the traditional age for each grade level are also particularly vulnerable. High rates of illiteracy are pervasive in the 15- to 24-year-old age group, and girls are especially at risk. For many young women and men, the cost of getting to and from secondary schools poses an insurmountable economic burden. The UNFPA report (UNFPA 2010) notes that educational attainment in Cambodia remains low, and universal basic education remains an elusive goal.

Health

Access to Health Care

One of the major problems regarding the health of Cambodian women is the lack of access to critical health care services and resources. According to a report by the National Institute of Statistics Committee for Population and Development (NIS 2010), more than 95 percent of Cambodian women have limited or no access to health care services. There are several reasons for this, including the prohibitive costs of both medical care and transportation to health care facilities. The lack of access to health care is confirmed by the CDHS (National Institute of Statistics, Directorate General for Health, and ICF Macro 2011), which found that 17 percent of married women did not have adequate family planning services. In Cambodia (as elsewhere), this had a particularly negative impact on women in the lowest income ranges and with the least (or no) formal education.

Maternal Mortality

The UN Development Programme's "Human Development Report" for Cambodia (UNDP 2014) notes a maternal mortality ratio of 250 deaths per 100,000 live births. The same report notes an adolescent birth rate of 44.327 births per 1,000 women 15–19 years of age. Although abortion was legalized in Cambodia in 1997, legal abortions conducted by trained medical professionals in appropriately equipped medical centers remain out of reach for many

Cambodian women. Illegal and unsafe abortions are common and contribute to maternal mortality statistics.

Infant and Child Mortality

A UNFPA report (2010) cited a reduction in both infant and child mortality rates in Cambodia between 2000 and 2005. Infant mortality rates dropped from 96 to 66 deaths per 1,000 live births, while mortality rates for children under 5 years of age dropped from 124 to 83 deaths per 1,000 live births. The report credits much of this improvement to a campaign encouraging women to exclusively breastfeed their babies whenever possible. Breastfeeding rates increased from 11 percent in 2000 to 66 percent in 2008. Breastfeeding is seen as an important variable in addressing high rates of neonatal and infant mortality: mortality drops off sharply as a child progresses through the first 12 months of life, and then drops again with each subsequent year the child survives.

Fertility

According to the CDHS (National Institute of Statistics, Directorate General for Health, and ICF International 2015), the total fertility rate in Cambodia is 2.7 children per woman. On average, rural women were found to have had slightly more children than their urban counterparts (2.9 versus 2.1 children per woman, respectively). Cambodia's total fertility rate has declined over the past 15 years. Teenage fertility remains a topic of particular concern due to its potentially severe social consequences for women and their children. In this survey, 12 percent of women 15–19 years of age (or roughly one in eight) became pregnant with or gave birth to her first child. The percentage of pregnant women increases with each year of age: less than 1 percent of women age 15 bear children, compared to 31 percent of women age 19. Girls in urban areas are less likely than girls in rural areas to have their first child by age 20 (6% versus 13%, respectively). The level of teenage fertility is strongly associated with a woman's level of education: 37 percent of teenage women with no formal education began having children before age 20, compared with 18 percent of teenage women with some primary education and less than 10 percent of teenage women with a secondary education.

Family Planning

According to the CDHS (National Institute of Statistics, Directorate General for Health, and ICF International

2015), 56 percent of currently married women are using some form of contraception, such as birth control pills or the withdrawal method. The same report also indicated that the use of modern contraceptives has increased over the past 10 years, from 27 percent of married women in 2005, to 35 percent in 2010, and 39 percent in 2014. Respondents noted that they normally did not begin using contraception until they had at least one child. The use of modern contraceptive methods is low (20%) for women 15–19 years of age, but it increases steadily as age increases, peaking with 48 percent of women aged 30–34 and 47 percent aged 35–39. Rates of contraceptive use begin to decline as women age. Modern contraceptive methods are more common in rural areas (40%) than in urban areas (33%); traditional forms of preventing pregnancy, such as the rhythm method or early withdrawal, are more common among urban women than rural women (27% versus 16%).

HIV/AIDS

According to the CDHS reports (2010, 2014), nearly all Cambodians have heard of HIV/AIDS. Three out of four women and approximately 80 percent of men ages 15–49 are aware of the two main ways to prevent HIV transmission (use of condoms and limiting sexual intercourse to one uninfected partner). The report also indicates that roughly 63 percent of women and 61 percent of men know that a healthy-looking person can still carry the AIDS virus, and 71 percent of women and 75 percent of men reported that AIDS cannot be transmitted by mosquito bites. Almost 90 percent of women know that HIV can be transmitted to an infant through breastfeeding, but 58 percent did not know that this risk can be minimized if the mother takes special drugs during her pregnancy.

HIV testing is relatively uncommon in Cambodia, and despite 7 out of 10 people knowing where to be tested, very few people do so. Being tested is critical, especially as extramarital affairs are common and married men frequently turn to commercial sex workers for pleasure. Wives often know about these affairs yet do little to stop them, either out of a desire to protect the marriage or because tolerating such behavior is traditionally expected of women. The Cambodian League for the Promotion and Defense of Human Rights (2004) cites a 2002 UNICEF report that the proportion of husband-to-wife and mother-to-child transmission rates of HIV have increased substantially, creating an estimated 30,000 AIDS orphans under the age of 15. Married women tend to have less knowledge about HIV/

AIDS, and they feel powerless to control their husbands' sexual practices.

In 2014, the National AIDS Authority reported that the prevalence of HIV in Cambodia declined gradually in the early 2000s and was estimated to be 0.7 percent in 2013 among the general population for ages 15–49. The rate of HIV infection continues to be concentrated among specific high-risk groups, including sex workers, men who have sex with men, transgender people, regular intravenous drug users, and prisoners. The prevalence rate of HIV infection within these populations ranges from 2.1 percent among men who have sex with men to 24.8 percent among people who regularly inject drugs. The reduction in HIV rates in Cambodia over the past decade is credited to a national educational campaign on HIV prevention activities and the use of antiretroviral therapy (ART). The goal of the campaign is to educate the public and encourage them to act in ways that decrease their chances of transmitting the virus to others.

Mental Health

The majority of governments in Asia spend less than 1 percent of their national budgets on mental health. Of all Asian nations, Cambodia in particular has quickly addressed the adverse effects of mental health problems associated with survivors of the Khmer Rouge genocide. This is because the government believes neglecting the mental health needs of the Cambodian people would likely have a negative impact on the nation's productivity and its ability to compete in the global economy, thereby affecting national social cohesion and well-being.

In November 2003 *Time* magazine published a special report on the lack of mental health care in Asia. Cambodia was, at that time, a nation of approximately 16 million people, and of the adults who had lived through the genocide, 75 percent had suffered from extreme stress, post-traumatic stress disorder (PTSD), or other related mental health problems. Yet, at the time, there were only 20 practicing psychiatrists in the country. In 2016, aid workers estimated that 40 percent of young Cambodians suffer from stress-related symptoms many believe is related to living in a fragile society with broken social networks.

Traditional values and social stigma are two major deterrents that prevent people from seeking mental health treatment. Cambodian society follows a collectivist tradition that discourages open displays of emotion or personal weakness to maintain social and familial harmony. The

stigmatization of mental illness reflects poorly on one's family image and deters many people from seeking the treatment they need. Cambodians often find it extremely difficult to express their emotions or to acknowledge any mental illness. Instead, they are likely to experience psychological distress as a physical ailment and report it as such.

Because of the Khmer Rouge history, virtually every Cambodian citizen has experienced psychological trauma and stress in his or her life. There is even evidence that the impact of the traumas suffered during the genocide has negative repercussions on the mental health of subsequent generations of survivors' families (Munyas 2008, Field et al. 2013). Mental distress among Cambodian adults is generally attributed to traumatic events they encountered during the genocide. These include being forced to evacuate the family home and relocate to a death camp, experiences with torture and rape, periods of starvation, witnessing the murders of innocent people, and widespread upheaval or destruction of familiar social, cultural, economic, and political environments. Among survivors, mental health problems are so widespread that they have come to be accepted as culturally normal. The stressors survivors experienced represent a national trauma shaped by a catastrophic sociopolitical and historical event.

A study by Nou (2002) showed that high exposure to stressors results in high levels of overall negative mental distress (psychological and somatic symptoms) and low life satisfaction among 1,257 Cambodian university, college, and technical students in post-Khmer Rouge Cambodia. Responses regarding the top stressors varied between men and women. The top three responses from men and women were "feeling hopeless about the future," "feeling very self-conscious with others," and "feeling that most people cannot be trusted." Women also cited other specific symptoms, including "having to avoid certain things, places, or activities because they frighten you," "hot or cold spells," "faintness or dizziness," "feeling no interest in things," and "feeling that people are unfriendly or dislike you." This study also found that higher-status students had significantly higher mental health symptoms than lower-status students.

The mental health needs of the Cambodian people may be indicated by rates of mental disorders in the population as a whole or by the existence of small subgroups that have a particularly urgent need for mental health care. The youth in Nou's research are at risk for high levels of psychological distress, despite not having lived through the Khmer Rouge period themselves; yet, they might reflect

the lingering adverse psychological effects of a traumatic past on the Cambodian population in contemporary time. Similar conclusions were made in a study conducted in Cambodia by Peterson, Prout, and Schwarz (1991), who noted the seriousness of Cambodians suffering from "collective posttraumatic stress disorder" (PTSD) and that virtually every member of Cambodian society is affected. They reported "secondary symptoms" of PTSD or related mental illnesses, such as anxiety and depression, among Cambodian refugees and college students in Cambodia. Baron (1996) found that once basic needs are met and psychological issues become more important, people in despair turn to alcohol, drugs, and gambling as a source of comfort to cope with mental distress in Cambodia—all of which were also found in Nou's study among Cambodian students. These studies and many others demonstrate the severity of the trauma experienced by the average Cambodian survivor of the genocide.

Employment

According to a UNFPA report (UNFPA 2010), Cambodian women are the most economically active in Asia, even though much of their work is routinely undervalued and critically underpaid. Research conducted by the United Nations and other organizations suggests that women in Cambodia experience the brunt of a global economic turn-down in terms of not being able to find jobs. Obstacles to employment for women include traditional attitudes about girls' and women's access to education, vocational training, and support services. Female entrepreneurs face additional challenges, as do women seeking higher-level professional positions that involve leadership and decision-making roles. Low rates of literacy and education among females are reflected in a correspondingly narrow selection of legitimate income alternatives. Women in rural areas are disadvantaged in terms of access to the marketplace and services, despite the fact that they account for 80 percent of Cambodia's food production workers, and more than 65 percent of Cambodian farmers are women (most of them unpaid family workers).

The 2010 CDHS report breaks down the most commonly reported occupations for women in Cambodia, stating that 56 percent of women are employed in the agricultural sector; more than 20 percent are in sales and services; 15 percent are in skilled manual labor; 4 percent are in professional, technical, or managerial roles; and 2 percent are in unskilled manual labor.

Gender inequality and constraints on women in the marketplace are discussed extensively in the *Asian Development Bank Gender Equality Labor Market Report* (ADB 2013). The report examined seven gender deficits for women, including labor force participation, human capital, unpaid domestic and care work, vulnerable employment, wage employment, decent work, and social protection.

Despite recent economic growth in Cambodia, women remain at a disadvantage in the marketplace. They routinely receive lower wages than men for the same work; they are often not paid at all for domestic or care work-related activities; they are exposed to high-risk working conditions without security or protection; they are discriminated against on the basis of age, marital status, and pregnancy; and they have limited access to formal employment. The 2013 ADB report (ADB 2013) advocates for the promotion of gender equality by critically examining Cambodia's macroeconomic development plans and policies to ensure that employment opportunities benefit women and men equally.

Family Life

The family structure is the basic social organization in Cambodian society. The bonds between family members are strong and often involve traditional rights and obligations. The family is the central unit of both economic production and consumption. In agricultural activities, family members supply the necessary labor, and relatives help as needed. Within this social unit, emotional bonds are strong, and whenever upsetting events occur, each member is quick to help resolve it. There is a great focus on the family as a collective group rather than on the individual, and in some cases, extended family members may be included in the definition of *family*. A network of personal kin in the household may include a nuclear family with the children, grandchildren, grandparents, uncles, aunts, first cousins, nephews, and nieces. Family organization and relations beyond the core kin unit are loosely defined. In rural communities, strong ties may develop outside of the nuclear family, with close neighbors and good friends being called (for example) "aunty" or "brother," despite not being members of the same family by blood or by marriage. Life events such as births, marriages, and funerals are major social events that draw participation of the extended family, who may stay on to live as part of the household temporarily or even permanently.

Relationships within the family system are hierarchically stratified. Older family members are given deference

and often act as the guiding force in family affairs. Although the husband is publicly recognized as the head of the family and typically consulted on all family matters, the wife has considerable power in private, especially in managing the family finances. The Cambodian husband's main role and responsibility is to provide food and shelter for his family. Cambodian wives, on the other hand, are responsible for a wide range of family activities, such as child-rearing, teaching the children ethics and religious traditions, balancing the family budget, maintaining the household, and protecting the family's well-being and reputation. Cambodian women are often actively engaged in entrepreneurship, and the children are expected to help as needed. After becoming adults, sons and daughters marry and move away from their parents, although they maintain emotional closeness with their parents and siblings.

Politics

According to a UNFPA report (2010), very few women hold positions of power or decision-making roles in politics. For instance, barely 15 percent of the members of Commune Councils and 19 percent of the members of the National Assembly are women. Although progress has been steady, it has been slow. In 1993, women represented just 5 percent of the National Assembly; in 1998, the percentage was 11 percent, and in 2003, it was 19 percent. Similarly, women serving on Commune Councils increased from 8 percent in 2002 to 14.6 percent in 2007. A 2014 UN Development Programme report (UNDP 2014) indicates that 18.1 percent of Cambodia's parliamentary seats are held by women.

Regarding women as judicial representatives, the UNFPA report (2010) indicated that, of the 239 judges and prosecutors appointed, just 29 of the judges and 1 prosecutor were women. Among 578 officially registered lawyers in Cambodia, 103 (17.8%) were women. More effort is needed to educate and recruit women to engage in politics and pursue careers in political science.

Religious and Cultural Roles

The central religious influence of Cambodian life is Theravada Buddhism, and approximately 95 percent of the population practices it. The *wat* (temple) was historically a prominent feature of each community. In rural communities, the *wat* served for centuries as a community gathering place and religious center. Outside the family, the *wat* was the central institution, or "hub," in most villages, and

Mu Sochua

Born in the Cambodian capital of Phnom Penh, Mu Sochua (1954–) is a human rights advocate and prominent member of the Cambodian National Rescue Party. Beginning in 1972, Mrs. Mu lived and studied in France and the U.S. for almost two decades, unable to return to her homeland in the wake of the Khmer Rouge genocide. Upon her return in 1989, she became determined to improve the lives of Cambodian women, children, and other marginalized groups. In 1991, she founded the nongovernmental organization (NGO) Khemara, which promotes access to education and healthcare as human rights and provides support for sex workers, people living with HIV/AIDS, and survivors of domestic violence. Mrs. Mu entered the world of politics when she won election to the Cambodian National Assembly in 1998. She also served on the cabinet of the Ministry of Women's Affairs, advocating for victims of human trafficking and gender-based violence. For this work, Mu was nominated for the Noble Peace Prize in 2005. Mrs. Mu was married to American Scott Leiper (d. 2016), whom she met while they were working in a Cambodian refugee camp in 1984, and she is the mother of three children. Presently, her work includes initiatives on equitable development, workers' rights, and government transparency.

its multiple functions indicate its importance. The *wat* also served as an educational institution for children, and until the late 20th century, it was the only source for acquiring an education. During the French colonial period, temple education was incorporated into the public school system. Social and recreational activities and the celebration of major events took place at the temple. Monks provided healing and indigenous medical treatment that reflected and aligned with spiritual beliefs. Astrology and similar practices were also performed at the temple. The temple's members played a key role in disseminating information from outside the village, and lay positions associated with the temple offered an avenue for community participation and leadership roles outside of the family.

Under the Khmer Rouge, the expression of religious beliefs and practices was prohibited as detrimental to communist ideology. Religion (especially organized religion) was considered dangerous and potentially threatening to the goals of the Khmer Rouge, and traditional Cambodian religion was abolished. Buddhist temples were closed or desecrated and used for purposes unrelated to religion. In some cases, laypeople and religious leaders (monks and nuns) were murdered at the temples. Buddhist monks and nuns—like everyone else—were required to disavow their oaths and work in labor camps. The revolutionary ideology

of the Khmer Rouge was to replace Buddhist thoughts and practices.

Despite the Khmer Rouge forbidding all expression of religious thought or practice—and, in fact, killing anyone who was known or suspected to have disobeyed this directive—one woman who survived the genocide gave the following reason: "Because my father taught me to obey the Buddha and trust him, this is what saved me. I had a Buddha with four faces, and my grandmother's teeth, hidden in my bra and I relied on these religious materials to protect me. I prayed every night to help me live and survive and protect me from the Khmer Rouge" (Nou n.d.). Other survivors have shared similar stories of religious faith giving them the strength to survive unthinkable hardships.

Today, women are responsible for many of the daily religious and ceremonial activities. For instance, women are often responsible for fund-raising and setting up food preparations for events held at the temple. According to Ledgerwood, holy days (*thngai sil*) are frequently attended by women, especially older women. Attending Buddhist services and visiting the temple are especially critical for those older women who are widows without family support or children to care for them. Many of these women are elderly and have lost their husbands and other family

Khmer Women Musicians

Khmer popular music from the prewar era is still alive and very much part of Cambodian culture. Cambodian women performers such as Chhom Nimol, Him Sivorn, Piseth Pilika, and Meng Kao Pichenda, to name a few, still remake songs that celebrate prewar artists and in particular Cambodian women singers.

Prewar popular women singers (1940–1975) in Cambodia assumed the role of representing Khmer woman. They included Mao Saret, Chhuon Malay, Sieng Dy, Sieng Vanthy, Chea Savoeun, So Sophen, Kang Chanthi, Hay Sokhoum, Hem Sovanna, and Vor Sarun. Few of them recorded, and sadly very few of their recordings (and no footage of their performances) survived the Khmer Rouge.

The concept of Khmer womanhood has changed over time with the arrival in the late 1960s of Ros Serey Sothea, Huy Meas, Pen Ron, and Pov Vannary in the early 1970s, into a new Khmer woman-embracing modernity.

These women built successful careers around their musical innovations. Their success stories embodied the new social mobility within a stratified society. Their public visibility influenced a whole generation of young women, challenging the social conventions of the time and generating new images of Khmer womanhood.

—LinDa Saphan

members to the genocide, and they turn to the temple for housing and spiritual strength as they approach the end of life.

Issues

Human Trafficking

To date, the literature on human and sex trafficking tends to focus on the characteristics of traffickers, the social organization of trafficking, or the antitrafficking movement and efforts to reduce trafficking and its impacts. Little attention has been paid to the psychosocial context of victims. The work of Somaly Mam, an anti-human-trafficking activist, brought the topic of human trafficking in Cambodia to international attention and garnered significant

international funding from political and social elites. Although Mam's claim that she had been a victim of human sex trafficking herself was found to be untrue in 2014, her work served the important purpose of making the global community aware of this issue.

According to a recent report from the U.S. Department of State (2012), Cambodia is a major source, destination, and transit country for men, women, and children trafficked for the purposes of sexual exploitation and forced labor. The report explains:

The sale of virgin girls continues to be a serious problem in Cambodia. Cambodian men form the largest source of demand for child prostitution, though a significant number of men from the United States and Europe, as well as other Asian countries, travel to Cambodia to engage in child sex tourism.

The U.S. State Department also notes that, while making some attempts to combat this problem, the government of Cambodia has repeatedly fallen short due to weak laws and regulations, the lack of clear delineation of responsibilities across agencies, unsuitable monitoring of agencies, and failure to enforce criminal penalties. For example,

Endemic corruption at all levels continue[s] to impede anti-trafficking endeavors and local observers believe it to be the cause of impunity afforded to firms engaging in illegal recruitment practices that contribute to trafficking. In December 2011, the former head of the Phnom Penh Municipal Police's Anti-Human Trafficking and Juvenile Protection Department was convicted in absentia and sentenced to seven years' imprisonment on complicity charges, including accepting payments from brothels in exchange for protection and information on future raids. However, corruption allegations were never addressed by the Phnom Penh Municipal Court or the Anti-Corruption Unit and the convicted offender fled prior to being apprehended and remain at large.

Sex trafficking, or "the recruitment, harboring, transportation, provision, or obtaining of a person for the purpose of a commercial sex act," involves over 1 million people every year. According to Kathryn Farr, of the 1 million or so women who are sex-trafficked to other countries each year, about 225,000 come from Southeast Asia (2004). UNICEF and Save the Children say that 50,000–100,000 women and children are involved.

Postconflict Cambodia has high levels of poverty, an unstable society, and ineffective governing institutions. Millions of Cambodians struggle to survive, and many turn to the sex industry as a source of income. Intergenerational social and cultural issues are also at play, as traditional Cambodian culture socializes women to accept their lower status relative to men—without question, across all major social institutions, including the family itself. The culture encourages girls not to question the authority of their parents and other adults. Human traffickers take advantage of these cultural beliefs and use them to prey on young girls and virgins, often misleading them with promises of legitimate employment as waitresses or maids, only to sell them into brothels. Increases in global sex tourism, as well as the persistent local belief that having sex with a virgin will cure HIV/AIDS, perpetuate both the spread of HIV/AIDS through Southeast Asia and the demand for ever younger victims—especially children from poorer, less-educated rural areas.

Acid Attacks

According to a recent report by the Avon Global Center for Women and Justice (2011), acid attacks are calculated acts of violence in which perpetrators throw, spray, or pour acid onto their victims' faces and bodies. Such attacks generally cause instant damage, permanent disfigurement, extreme physical and mental suffering, and sustained medical complications for victims. In Cambodia, the impact of such attacks is worsened by the scarcity of health care professionals who are properly trained in treating acid burn victims, the lack of health care facilities specializing in the treatment of burn victims, and the tendency for victims to be ostracized by society and fired from their jobs.

Based on a comprehensive review of acid attacks, the Avon Center's report focused on Bangladesh, India, and Cambodia—the three countries with the highest rates of acid violence in the world. Acid violence is possibly more common in these countries because the types of acid used are inexpensive and widely available. The victims of acid attacks are usually women, and the report considers acid violence a gender-based violence that reflects and perpetuates the inequality of women in society. Therefore, it is prohibited by international law.

Women and girls are often the targets of acid violence, largely because of their socioeconomic insecurity, although men are also at risk of victimization. Attackers may be male or female. Most acid attacks are made by a

man against his wife or mistress or by a woman against the “other woman”—her partner's mistress. The latter type of attack is often intended to break up the relationship by disfiguring the mistress, thereby securing the wife's social and economic standing within the relationship. Many attacks by either gender are motivated by jealousy or a desire to retaliate against a “competitor” for the attention of one's partner. Cambodia does not compile national statistics on acid violence, but the Cambodian Acid Survivors Charity (CASC) has collected data on victims treated in hospitals for acid burns. The group reports 271 known cases of acid violence between 1985 and June 2010 in Cambodia. The actual number of cases is almost certainly greater than 271; many victims are too ashamed to report the crimes or too fearful of further attacks to seek medical treatment for their injuries.

Prior to 2000, acid attacks in Cambodia remained relatively unfamiliar to the public. However, after a high-profile attack against 16-year-old Cambodian singer and karaoke star Tat Marina, this issue was thrust into public discourse (Mydans 2001). On December 5, 1999, Tat was attacked by three unknown assailants who drenched her face and chest with more than a liter of acid, permanently disfiguring her. The local and international public was outraged, and as a result, aggressive investigations revealed that the perpetrators were the jealous wife of a senior government official and her two bodyguards. None of them were arrested or charged for their crimes. This led to copycat attacks in which the perpetrators were, likewise, rarely convicted. This pattern further reinforces the oft-cited culture of impunity in Cambodia.

The Avon Center's report also notes that there are often unintended victims of acid violence—other people in the area (particularly children) or even the attackers themselves. Such unintended targets account for 12 percent of acid-violence victims. The report asserts that the Cambodian government has not adopted criminal laws that specifically address acid violence or laws aimed at reducing the easy availability of acid and cites the lack of punishment for these crimes as one reason for the alarming rates at which they have occurred since 2010.

To eradicate acid violence, the Avon Center report recommends that the governments of Bangladesh, India, and Cambodia address its root causes (specifically, inequality and discrimination against women) and (1) enact laws that adequately punish perpetrators of attacks and limit the easy availability of acid, (2) enforce and implement those laws, and (3) provide redress to victims, including

compensation for health care costs. Until and unless such steps are taken, the attacks are likely to continue.

***Bauk* (Gang Rape)**

The phenomenon of *bauk* (gang rape) among Cambodia's male youth has surfaced as a major and pervasive social problem in contemporary Cambodia. *Bauk* often occurs among young, middle-class men who obtain a female (often, but not always, a sex worker) ostensibly for their individual pleasure, but then they bring the girl or woman to a location where other male friends are waiting; the group of men then force the woman to have sex with multiple men. This "chilling form of recreation" was featured in a segment on National Public Radio (NPR) in 2009 (Snyder 2009) and again in an online report from the *Cambodia Daily* (Henderson 2013), but it has been discussed in the media since at least 2003 (Nou 2002, 2003).

The *Cambodia Daily* report (Henderson 2013) shared the findings of a 2013 UN study (UN News Centre 2013) in which "male interviewers surveyed more than 10,000 men and a smaller number of women in Bangladesh, China, Cambodia, Indonesia, Sri Lanka, and Papua New Guinea." The UN study found that "more than 1 in 5 Cambodian men aged between 18 and 49 admit to having raped a woman, and more than half committed their first rape before the age of 20." Alcohol—often used to explain or excuse violent behavior—was cited as a reason for rape by only 14 percent of the men surveyed; 42 percent said anger or a desire to mete out punishment motivated their actions, and 27 percent said they were motivated by either "fun" or "boredom." Notably, Cambodia is the only country in the region where men reported more sexual violence against women than physical violence. It is also the only country in which gang rape is actually more common than individual rape; elsewhere, rape by multiple perpetrators is the *least* common form of nonpartner rape.

Soprach Tong, a public health expert and the social affairs columnist for the *Phnom Penh Post*, has been covering the topic of sexual violence since 2003. In a post dated August 18, 2015, Soprach contrasts the mild Cambodian reaction to reports of gang rape with the immediate, outraged response seen in India after the gang rape (and fatal assault) of Jyoti Singh Pandey near Delhi in December 2012: "When news broke from India about the horrific gang rape and murder of a young woman, it was condemned by the government and was cause for global outcry. But when incidents like this occur with alarming frequency

in Cambodia, this violence has somehow become normalised to the point that it garners very little reaction at all" (Soprach 2015).

The UN report included a number of recommendations for reducing the prevalence of sexual violence in the areas studied, including working with community mobilization programs and influential cultural leaders to shift the social norms that lead people to accept gender inequity, the subordination of women, and violence against them. It also recommends promoting ways of being a caring and nonviolent man (e.g., coaching a boys' sports team or volunteering as a tutor or mentor) and educating young people—especially boys and young men—about healthy sexual relationships based on mutual consent and respect. Finally, "the study also calls for ending impunity for men who use violence against women, particularly marital rape, through criminalization of all forms of violence against women, and [the promotion of] legal sector reform to ensure effective access to justice."

This author asserts that *bauk* is symptomatic of an underlying phenomenon related to the lack of social and family cohesion and unresolved psychological consequences of the Khmer Rouge period; it is reflective of a national mental health epidemic in Cambodia. The psychological scars of past traumas may be manifesting themselves both in the deviant behaviors of the first postgenocide generation and the hostility of a Cambodian government that often uses violence to resolve societal problems. Genocide survivors may inadvertently be passing along negative psychological patterns to their children, who are ill-equipped to cope with the stressors in their lives. Cambodian youth are particularly vulnerable to the myriad layers of stress—social, cultural, political, economic, legal, environmental, and educational—in a country that continues to struggle to overcome the repercussions of genocide and become a fully participatory member of the global economy.

The Khmer Rouge Tribunal

The ongoing trials of former Khmer Rouge leaders in the Extraordinary Chambers in the Courts of Cambodia (the ECCC, or the Khmer Rouge Tribunal) represent an important sociopolitical issue and an opportunity for all Cambodians to try to attain a sense of justice and closure related to the genocide. Until these trials began in mid-2007, no victims' testimonies had been heard in a court of law, no perpetrators had been tried, and no sentences decided. Cambodia's culture of impunity continued unabated, and

Testimonies against the Khmer Rouge

Mrs. Sophany Bay was one of many women who testified against the Khmer Rouge. Then 67 years old, Bay traveled from her home in San Jose, California, to Phnom Penh, Cambodia, to testify in the Extraordinary Chambers in the Courts of Cambodia (ECCC) on June 4, 2013. She was accompanied by Leakhena Nou and a small group of other victims and survivors who had filed Victim Information Forms with procedural support from the Applied Social Research Institute of Cambodia (<http://www.asricjustice.com>).

Bay was raising a family in Phnom Penh when the Khmer Rouge came to power in 1975. Before a full gallery of Cambodian and international observers, she described the evacuation and subsequent splintering—and ultimate destruction—of her family. Her testimony was powerful, and it left the defense attorneys speechless. (A recording of Bay's testimony appears here: <https://www.youtube.com/watch?v=ANlkg3qKWMw>.)

In the first 40 minutes of the testimony (<http://www.eccc.gov.kh/en/blog/2013/06/04/american-ngo-returns-court-support-civil-party>), Bay recounts in heartbreaking detail the senseless deaths of her three young children. First, the family was forced from their home and made to walk from one remote, unfamiliar location to another to do hard manual labor. Sometimes Bay and her children could stay together while they worked, and other times she was forced to leave them alone all day.

They were provided starvation rations (one cup of watery gruel for an adult and half a cup for a child), but even these would eventually be taken away. All three children soon became sick. Bay sought help for her youngest child at what she had been told was a medical outpost. There, she met a man who said he was a medic and could help. This man, a member of the Khmer Rouge, administered a fatal injection of an unknown substance into the baby's skull. Bay buried the infant girl in the forest. Her two remaining children endured brutal maltreatment at the hands of the Khmer Rouge, including a mock execution of her son in front of his mother and remaining sister. The boy died a short time later from starvation, fever, and extreme exhaustion from forced labor. Bay buried her son in the foothills close to the family's work location at that time. Bay's only remaining child was also near death and passed away shortly after her brother.

justice remained as elusive as ever. More than 35 years after the end of the genocide, Cambodians around the world are still struggling to find solace in the face of adjustment difficulties and psychological torment stemming from atrocities inflicted by the Khmer Rouge. The social health of Cambodians worldwide hinges on the genocide's perpetrators being brought to justice.

Women have played a critical role in this effort by providing the ECCC with firsthand testimonies against the Khmer Rouge. The Victim Information Form is the official document required of all people claiming to be victims and seeking recognition by the ECCC; 61 percent of all Victim Information Forms were filed by women from the U.S. diaspora. Reliving this painful history to file the Victim Information Forms required courage; some victim and survivors have opted out, while others have been braver still, opting to participate personally in the courtroom proceedings, as well. (For more information on victims' participation in the ECCC, see Nou 2013, 2016, n.d.)

Today, the distorted "utopianism" envisioned by the Khmer Rouge has been replaced by Cambodian national construction. In this new chapter of Cambodia's history,

there is a welcoming of democracy, an opening of markets, and an emerging geopolitical identity for Cambodia in Southeast Asia. In this regard, as with so many other issues discussed earlier in this chapter, Cambodia has just begun what will likely continue to be a long process of incremental change.

China

Overview of Country

The People's Republic of China is located in East Asia and shares land borders with 14 countries, including Afghanistan, Bhutan, Burma, India, Kazakhstan, North Korea, Kyrgyzstan, Laos, Mongolia, Nepal, Pakistan, Russia, Tajikistan, and Vietnam. Its regional borders include Hong Kong and Macau. The country is roughly 3.7 million square miles (9,596,960 sq. km). As of early 2017, the population of China was 1.389 billion people, and close to 55.6 percent of the population is urban (CIA 2017). The UN Development Programme (UNDP 2016) ranked China 37th and 90th out of 188 nations based on the Gender Inequality Index (GII, 0.164), and the Human Development Indicators (HDI, 0.738). There is no officially released information on the LGBTQ population as of 2015, but various sources propose an estimate of 40–70 million people.

The sex ratio at birth is 116 males per 100 females in China (UN DESA 2014), and a 2015 estimate of the sex

ratio of the total population is 1.06 male(s)/female (CIA 2017); 51.27 percent of the population is male, and 48.73 percent is female (NBSC 2014). Among males and females born in the 1970s, 1980s, and 1990s, the number of single males has exceeded that of single females by more than 23 million (CIA 2017). Sixteen percent of the total population is under the age of 15; 73.9 percent of the population is 15–64 years old, and 9.7 percent of the population is age 65 and over (NBSC 2014).

According to the Sixth National Population Census of China (2011), there are 56 ethnic groups in the country, among which Han is the largest group (91.5% of the population). The other 55 ethnic groups (8.49% of the population) are usually referred to as ethnic minority groups (NBSC 2011). Zhuang is the largest ethnic minority group (1.3% of the population) (CIA 2017). The same census also indicates that 48.73 percent of the total population is female, and the male/female sex ratio has dropped from 106.74 in 2000 to 105.20 in 2010 (NBSC 2014).

There are five major religions in China (Buddhism, Taoism, Islam, Catholicism, and Christianity), and approximately 10 percent of the population is religious (Lu 2014). Folk religions—religious traditions and practices outside any official doctrine and practice—that draw ideas and elements from Confucianism, Taoism, and Buddhism are observed in some areas (e.g., ancestral worship) (NPCPRC 2007). Shamanism is common among Elunchun, Ewenke, Hezhe, Xibo, Dawur, and Manchu ethnic minority people in Northeast China. There are also various forms of indigenous religions among certain ethnic minority groups, such as Buyi, Hani, Lisu, Naxi, Qiang, Tibetan, Wa, Yi, and Zhuang in Southern China.

Languages spoken and written in China are primarily from Sino-Tibetan, Altaic, Austro-Asiatic, and Indo-European language families. There are approximately 130 languages and 30 written languages. The official written language is Chinese, which uses simplified Chinese characters and the pinyin system at all levels of formal education and publications. The Han, Hui, and Manchu ethnic minority groups use Chinese exclusively, while the other 53 ethnic minority groups all have their own languages. Approximately 53 percent of the population can communicate in the official spoken language, Mandarin Chinese (standard Chinese, or *Putonghua*).

There are seven dialect groups across the country: Northern, Wu, Xiang, Gan, Hakka, Yue, and Min (MOE 2015). The complexity of dialects in each group (e.g., phonetics, semantics, and syntax) makes it difficult for communication, as

they are incomprehensible to people unfamiliar with them. For example, Cantonese, spoken mainly in Guangdong Province and Hong Kong, has its own unique systems of phonetics and syntax. People from non-Cantonese-speaking areas usually find it very challenging when visiting those places or communicating with natives who do not understand or speak Mandarin Chinese.

China replaced the Republic of China (also known as Taiwan) in the United Nations in 1971 and became a member country. It is currently also one of the five permanent member countries in the UN Security Council (which also includes France, the Russian Federation, the United Kingdom, and the United States). Chinese is also one of the six working languages used in the United Nations (MOE 2015).

Tibet

Tibet is an autonomous region of China, distinguished particularly by its Tibetan language and Tibetan Buddhism. Tibet's relationship with China is fraught with various interpretations among Tibetans and the Chinese. China claims a centuries-old rule over Tibet. Throughout history, Tibet has at times acted independently and has been ruled by Chinese and Mongolian dynasties. In modern times, in 1950, the Chinese began to incorporate Tibet. China claimed their intervention as freeing Tibet from a repressive regime, but many Tibetans and other nations see incorporation as Chinese invasion of a sovereign country.

Most Tibetans are Buddhist, but Buddhism in Tibet arrived from India rather than from China. The Dalai Lama, the spiritual head of Tibetan Buddhism, is also the political leader of the country. When an armed rebellion against the Chinese broke out in 1959, the Dalai Lama fled and created a government-in-exile in India. In the 1960s and 1970s, China destroyed most of Tibet's monasteries and carried out severe repression of Tibetan people.

Tibetan Buddhists believe the Dalai Lamas are "manifestations of the Bodhisattva of Compassion and the patron saint of Tibet. Bodhisattvas are believed to be enlightened beings who have postponed their own nirvana and chosen to take rebirth in order to serve humanity" (dalailama.com 2017). The current Dalai Lama is the 14th.

In 1963, the Dalai Lama offered a draft democratic constitution for Tibet, which became the Charter of Tibetans in Exile. In 1992, the Central Tibetan Administration offered guidelines for a free future Tibet. In 2001, Tibetans took a further step toward democracy, electing for the first time the senior-most cabinet minister.

When the international community brought pressure on China in the 1980s, the government eased some of its repression, but many human rights groups argued that China was continuing to violate human rights in Tibet. China has denied the accusation.

In 1987 the Dalai Lama offered a five-point peace plan:

1. Transformation of the whole of Tibet into a zone of peace.
2. Abandonment of China's population transfer policy that threatens the very existence of the Tibetans as a people.
3. Respect for the Tibetan people's fundamental human rights and democratic freedoms.
4. Restoration and protection of Tibet's natural environment and the abandonment of China's use of Tibet for the production of nuclear weapons and dumping of nuclear waste.
5. Commencement of earnest negotiations on the future status of Tibet and of relations between the Tibetan and Chinese peoples. (dalailama.com 2017)

To date, this plan has not been negotiated with or enacted by the Chinese government, although the Dalai Lama received a Nobel Peace Prize in 1989 for his work on behalf of Tibet.

Although the Dalai Lama and the Chinese government communicate occasionally, China fears the Dalai Lama continues to seek independence for Tibet and accuses him of inciting a number of self-immolations since 2009.

For his part, the Dalai Lama explains that he holds "three major commitments: the promotion of basic human values or secular ethics in the interest of human happiness, the fostering of inter-religious harmony and the preservation of Tibet's Buddhist culture, a culture of peace and non-violence" (dalailama.com 2017). In 2011, the Dalai Lama

transferred his temporal political power to the democratically elected leader of Tibet, again separating the political and spiritual functions of Tibet's leaders.

The Dalai Lama has suggested the office of Dalai Lama may not need to continue. Many Tibetans argue that the reincarnation of the Dalai Lama is not his decision, although he has suggested Tibetans should decide whether the institution should continue. He has said his successor would not be born in a country controlled by the People's Republic of China, recognizing that the Chinese government might try to name his successor. He has also suggested the next incarnation could be a woman.

China adopts the People's Congress political system. Eligible voters elect deputies to the National People's Congress and local people's congress. Although there are multiple political parties in China, the Chinese Communist Party is the leading party. The other parties are engaged under the model of multiparty cooperation and political consultation. The Chinese government resumed its exercise of sovereignty over Hong Kong under British rule for over a century (1997) and Macao under Portuguese rule for three centuries (1999) (HRC 2009). However, the Chinese government abides by the principle of "One Country, Two Systems" and gives Hong Kong and Macao political and economic autonomy to initiate and enforce policies without changing their existing social and economic systems, except specific policies in defense and foreign affairs.

Hong Kong and Macao have built their infrastructures to specifically tackle pertinent problems with issues such as gender-based inequality and discrimination. Hong Kong passed the first Domestic Violence (Amendment) Ordinance in 2008, and Macao passed the Domestic Violence Prevention and Correction Law in January 2015. The local government in the special administrative regions preceded the central government that passed its first national law against domestic violence in December 2015 and enforced it in mainland China beginning March 2016. Another example of the differences between Macao and Hong Kong is seen in the legal aspects of abortion. While abortion is illegal in Macao, it is permissible for certain situations in Hong Kong, if legally performed by registered doctors in designated facilities. There is not a specific law stating that abortions are legal in mainland China, but they are performed under very specific legal restrictions.

Girls and Teens

In 2010, girls under the age of 18 accounted for 46.3 percent of the youth population, but the overall percentage is lower than that of the female population, which is 48.8 percent. Although there is a higher rate of population urbanization, approximately 55.1 percent of girls live in rural areas. Given the vast demographic differences in China, girls' life experiences vary based on the size and economic development of the cities, towns, or villages in which they reside, ethnic or social groups with which they are affiliated, and family backgrounds, among other reasons.

Higher levels of education and urbanization have helped change traditional attitudes of a preference of boys over girls and narrowed the sex ratio from 121.2 in 2004 to 116 in 2014. However, sex imbalance continues to reflect the cultural preference of males over females. Gender socialization is clearly embedded in daily activities. In addition, unequal distributions of resources and opportunities for school-age children in urban and rural areas also contribute to different experiences (NWCCW 2011).

Gender socialization starts for girls and boys before they attend kindergarten. Children are exposed to gender-specific colors, toys, clothing, and games at home. Activities and instructional materials used in kindergarten usually align with gender stereotypes. Girls also learn gender through media. Nonetheless, gender socialization for girls in rural areas may happen differently, as many of them live in poverty or remote areas; they have limited access to kindergarten, toys, or even mass media. As a result, their gender socialization is primarily through family members, peers, and local community members.

Sex education is aimed at school, family, and society collaborations in the process of coaching and educating adolescents to learn about their bodies, proper behavior, and responsibilities. The Chinese government has promoted sex education for adolescents since 1949. The Ministry of Education of China officially recommended it as part of the education plan (1988) and decided to implement puberty education in junior high schools (1991), but there haven't been specific guidelines or universal sex education classes. Girls usually learn about their bodies and puberty from family members (38.93%), schools (30.04%), friends (11%), and media (29%) (CPRI 2015). However, girls whose parents are absent tend to receive little knowledge about puberty from family members.

Extracurricular activities for girls vary. Like other students, girls living in cities have more choices than those living in rural areas. In cities, girls participate in sports and artistic activities and attend various classes, including music, English, or dance. Not all of these activities are free, which means girls from low-income families cannot afford to participate. Girls living in rural areas have limited access to extracurricular activities because either schools are inadequately funded or opportunities are not available.

Girls usually play different family roles depending on their family backgrounds and needs. Girls who are only children and whose parents have stable jobs live a relatively easier life than their peers from low-income families. Even though boys are favored over girls in general, these girls' parents are more open-minded. These girls' priorities are schoolwork and selected extracurricular activities. Their parents either do all the housework or pay housemaids to do it. In contrast, girls who are the only child in their families and whose parents have low-paying jobs help with housework more often.

Girls living in rural areas are caregivers, even though they are young. Many of them are not the only child. Some of them may have one or both parents absent. Therefore, they are very important caregivers. They take care of their siblings, clean, cook meals, feed animals, wash clothes, or work outside the house. Approximately 30 percent of them help with housework, whereas fewer than 20 percent of boys assume similar responsibilities at home. They also do more housework in comparison to their peers in the city (CPRI 2015).

It is undeniable that girls under the age of 15 have enjoyed freedom of education and an abundance of

Women's Voices

Chenhui Ho

I was born in Beijing, China, and grew up there. In the 1970s, when I was in middle school, my body began to change: I started menstruation, and my breasts began to bulge.

I and my female classmates in my age group were hitting puberty, and with little information available to us, there was universal fear and shame. At that time, during China's Cultural Revolution, my mother was detained in the school where she taught and was not allowed to go home. My father and older brother were separately sent to distant farm labor, with only me taking care of my younger brother and sister at home. I had no older female family members to help and no school physiology class.

I remember the day of my first menstruation. I was trembling with fear, not knowing what happened, and thinking I was going to die. Fortunately, a close classmate friend about a year older saved me, telling me what was going on, what I had to buy, and what I had to do.

At the time, the cultural pressures were to have small breasts. With the fear of our bodies changing and with our poor sources of information, we all made very tightly wrapped bras to rein in our chests, trying to stop the growth of the breasts. All this was to little avail because of the natural growth happening anyway. One of my classmates feared physical education, and particularly running and jumping, because she could not hide her large breasts. The times were not kind for some of us.

With China's opening up, that era is over. Beauty standards have totally changed and are more like Western culture—maybe going too far. Online in China, ads to increase breast size abound. The pendulum seems to have swung from one extreme to the other.

resources and material goods in the Economic Reform Era. Nonetheless, the market economy, traditional gender relations, the one-child policy, and urbanization have also created a serious sex imbalance, deep socioeconomic divide, and gender inequality regarding girls' lives in different locations. The Chinese government and some non-profit government organizations have conducted in-depth studies and analyses, hoping to initiate substantial changes to minimize inequality. *China's Children Development Program (2011–2015)* by the National Working Committee on Children and Women under the State Council (NWCCW 2011) and the *Report on Girls' Education and Development Demand 2015* by the China Philanthropy Research Institute (CPRI 2015) clearly reflect institutional and philanthropic attention to girls' education, development, and inequality.

Education

The current education system in China includes preschool, primary, secondary, and postsecondary education, such as two or three years of vocational and technical education, four years of undergraduate education, two to three years of postgraduate education for master's degrees, and three to four years of graduate school for doctoral degrees. Women aged 18–64 years old have an average of 8.8 years of education. Among the 33.7 percent of women with a high school education or above, approximately half are in urban areas (ACWF 2011). In 2014, percent 99.81 percent of both school-aged boys and girls were enrolled in school (MOE 2015). There are more females pursuing various college degrees, including advanced graduate degrees, than males.

The improvement in gender equality in education reflects the long-term commitment of the Chinese government. After the People's Republic of China was founded in 1949, the illiteracy rate was as high as 80 percent, and half were females. It became a major concern for the new government, and national movements were launched in 1952, 1956, and 1958 to tackle the problem. Mandated classes were offered in urban and rural areas. With continuous state support and regulations, the female illiteracy rate decreased dramatically by the early 1960s. More organized programs have been implemented, and structures of education have been adjusted to decrease the female illiteracy rate in the past 30 years. New reports indicate that the female illiteracy rate for ages 15 years and over was 6.7 percent in 2013 (IOSC 2015) and 5.5 percent in 2015.

K–12 Education for Girls

K–12 education in China includes three years of kindergarten (preschool is primarily for underdeveloped areas where kindergartens are not available), 6 years of primary education, and 6 years of secondary education (3 years of junior and 3 years of senior secondary education), for a total of 15 years. The Compulsory Education Law of the People's Republic of China (1986) requires a minimum of 9 years of universal education for all school-aged children nationwide. The gender gap in school enrollment is not obvious in the first 3 years of primary school education.

China's National Plan for Medium and Long-Term Education Reform and Development 2010–2020 (MOE 2010) emphasizes that preschool education is fundamental for children's well-being and health. It calls for universalizing one-year preschool education while aiming for developing two-year preschool education. It also emphasizes the importance of establishing preschool education in rural areas. Some direct gains since 2010 have been reflected in an increased enrollment of girls in preschool education. More girls have been enrolled in kindergartens and preschools (2015), and the net enrollment of school-aged girls in primary schools is 99.72 percent (2015). The gender gap has also narrowed in high school enrollment. About 47.8 percent of high school students are females (2015), which is also slightly higher than 2010 (NBSC 2011).

Girls' Education in Rural Areas

Girls in rural areas, like their counterparts in urban areas, are required to receive the nine-year compulsory education and are encouraged to pursue advanced levels of education. Nevertheless, approximately 97.6 percent of them (ages 10–17) are in school (ACWF 2011), compared to their counterparts in urban areas at 99.3 percent. Studies note that girls in rural areas are faced with many challenges of retention and start to drop out beginning in third grade. Contributing factors include poverty, early engagement or marriage, mothers' level of education, lack of personal interest, absence of parents who are migrant workers in the city, traditional gender norms, adverse natural environment with inconvenient transportation and inaccessible schools in adjacent areas, or lack of female role models in school. Ninety-seven percent of girls in rural areas are in school at the age of 14, but only 63 percent are still in school at the age of 17. Almost 71 percent are reported to have completed the nine-year compulsory education, with a 23 percent difference in

comparison to their peers in the city. In addition, school-aged girls from ethnic minority groups living in rural areas have a lower school attendance rate, and the retention rate is low (CCTF & CPRI 2015).

Girls also drop out because of gender socialization and culturally held beliefs that girls' education is less desirable or a waste of money. Studies have shown that parents tend to withdraw daughters from school and keep sons in school if the family cannot afford to pay for all of them to stay in school. It is also common for girls to become engaged or married at younger ages in rural areas, which contributes to girls' dropout rates (CCTF & CPRI 2015). A survey of 11,000 students in 2010 and 2012 indicated that girls from poor families dropped out of school because of teen marriage, a major contributing factor.

In rural areas, girls start to talk about marriage at an early age, around 15 years old. In addition, girls in rural areas usually move into their husband's household after getting married and contribute labor and income to the new family. This has historically been considered a net loss for the girl's family. Therefore, families with girls are unwilling to spend money on girls and do not consider education a must. Although people in rural areas have become more open-minded, traditions die hard, and girls in poverty-stricken areas, in particular, have a higher dropout rate. On average, girls living in poverty-stricken regions in the west, ethnic minority regions, and some mountainous areas tend to receive less education and have high dropout rates in elementary and middle schools.

The China Children and Teenagers' Fund launched the Spring Bud Project to help girls who had dropped out return to school in 1989. Since its implementation nationwide, this social welfare project has funded over 2.517 million girls and provided 523,000 adolescent girls with technical training. It has undoubtedly advocated gender equality in education and helped protect girls' rights at educational, social, and cultural levels.

Migrant children's education has also been a source of concern. Currently, 46.8 percent of the child migrant population is school-aged girls. With the very strict *hukou* system (residence registration), many children have limited, little, or no access to regular school education after they join their parent(s) working as migrant workers in the city. Some public schools allow these children to attend school under pressure from the government, but they have higher admission restrictions. There are some private schools for migrant children, but these schools have limited resources and weak teaching teams.

Postsecondary Education

Since the national college examination resumed in 1977, more females have attended college for different academic degrees or professional training. More universities and programs have been made available or accessible in the past 35 years. Gender equality in higher education has been a major concern in public policies, and college admissions and social attitudes toward education have also changed greatly. More families hope to provide girls with education for better job opportunities. Gender inequality in employment and the workplace also pushes more females to higher education if they want to be competitive.

The political, social, cultural, and economic environments in combination have made it possible for more women to attend college. Take 2014, for example: 52.1 percent of college students in two- or four-year programs and 49.2 percent of graduate students were women, and 56.1 percent of students in adult education programs were women (NBSC 2015). The White Paper released by China's cabinet (IOSC 2015) reports a slight increase in female enrollment since 2013: 52.1 percent of undergraduate students, 51.6 percent of postgraduate students, and 36.9 percent of doctoral students are women.

The increased female student body in higher education does not necessarily reflect gender equality, as gender segregation in college majors is concerning. For example, more women major in liberal arts and medicine, and more men major in science, technology, engineering, and math (STEM). The disparity is inevitably related to gender socialization and stereotypes regarding intellectual capacity based on gender differences. Those who believe there's a natural difference in cognition would argue that females have better communication skills and nurturing skills, whereas males have better skills in logical thinking and analysis. To align with that belief, they would justify gender segregation in college majors. That is the case in college major selection, admission, classrooms, and job placements. Women interested in STEM majors are usually discouraged from selecting those majors. The Ministry of Education has made a special note to prohibit gender discrimination in admissions.

Even if female students prove themselves competent in the STEM fields, they feel uncomfortable because they are in the minority and tend to feel unconfident and frustrated. Bleak job placements for female students in the STEM fields add more challenges because potential employers prefer to hire male graduates who will not be held back because of family commitments after they are married.

Health

An improved and reformed health care system in combination with intensive planning and legal protection has helped improve Chinese women's health considerably. Women's average life expectancy is 77.4 years in 2014, whereas it was 42 years when China was founded. Similarly, the maternal mortality rate (MMR) is 21.7 deaths per 100,000 live births in 2014, as opposed to 1,500 deaths per 100,000 live births when China was founded. Factors contributing to improved reproductive health include age, occupation, hygiene, income, and education.

More women receive primary health insurance (>95%) and regular or annual health screening, use contraceptives, participate in pregnancy-related and regular health insurance programs, utilize prenatal and postnatal care services, and deliver babies in the hospital (99.6 %) (NBSC 2015). Other contributing factors of improved women's health include poverty reduction, education, and improvement in socioeconomic status. According to the Third Survey of the Social Status of Women in China, about 64.2 percent of women consider themselves in good health, a 9 percent increase since the Second Survey (ACWF 2011).

There are 10,694,000 medical personnel working in 983528 health care facilities that focus on Western or Chinese medicine, including public and private hospitals, clinics, and public health agencies or centers in urban or rural areas. Total health expenditures account for 6.0 percent of the gross domestic product (GDP) (NHFPC 2016). Health insurance in the planned economy system facilitated cooperative medical schemes in rural areas and Labor Insurance System in urban areas, and services were available in public facilities at village, township, and district levels. Patients paid very little. Universal insurance coverage was the norm.

The economic reform beginning in 1978 has brought about substantial changes in health insurance and medical services. Health reform between 1978 and 2011 redefined the health care system and initiated a series of insurance programs and plans. With the reform, a network of comprehensive three-tier medical and health services has been established. Basic health care services and emergency cases are administered by province, prefecture, and county hospitals. Public health services are provided by township and village clinics (NHFPC 2016). The central government subsidizes some programs in rural and urban areas. Overall, the reform aims at higher coverage, better reimbursement rates, higher financial protection, efficient management, and aid funds.

Women's Voices

Margaret Chan

Dr. Margaret Chan is the director general of the World Health Organization (WHO). She earned her medical degree from the University of Western Ontario. Born in the People's Republic of China, Chan began her career in public health in 1978 when she joined the Hong Kong Department of Health. Chan was selected for a nine-year appointment as the director of health of Hong Kong in 1994, where she oversaw programs to prevent and manage the spread of communicable disease, and she campaigned for improved training of public health professionals (WHO 2015).

In 2003, Chan joined the World Health Organization and was elected director-general in 2006. In her speech to the World Health Assembly, Chan prioritized the health of women, stating, "Reducing health problems in women and empowering them will result in a dramatic increase in health-promoting behaviors" (Chan 2015). Chan cited the health of women as a key indicator of overall global health, recognizing women's role as agents of change.

Women living in different areas and working in different professions have access to different health care resources and insurance plans. Their experiences with health care services therefore also differ. Socioeconomic status, geographical differences, or financial barriers may explain some differences. For example, women in rural areas visit doctors or facilities less because of high out-of-pocket fees (35% in 2011) or inconvenience (e.g., transportation). Many migrant women living in the city also use facilities less because of the type of health insurance plan and high out-of-pocket fees. Upper- and middle-class women have easier access to health care, while poor working-class

women have more financial and systemic barriers to health care, and preventive health care in particular.

In addition, differences in health care facilities, such as trained medical personnel, equipment, or diagnostic technology, also affect women's experience of health care services. Maternal mortality rate is a good example. It is higher in some provinces because of unbalanced development in women's health care, particularly prenatal care (NBSC 2015).

Regarding prenatal and postnatal care, the Third Survey of Social Status of Women in China found that 94.8 percent of urban women under age 35 used prenatal care, and the in-hospital delivery rate was 97.2 percent (ACWF 2011). In rural areas, 89.4 percent of pregnant women used prenatal care, and the in-hospital delivery rate was 87.7 percent (ACWF 2011). There has been a noticeable increase since 2010 (NHFPC 2014). In 2013, 95.6 percent of pregnant women received prenatal care, and 99.5 percent had in-hospital delivery. About 93.5 percent of women also returned for their postpartum checkup. The breastfeeding rate, however, has continuously declined. Only 28 percent of mothers breastfeed their babies for up to six months, and only 17 percent in the city choose to breastfeed. The central government has started to consider legal intervention so that breastfeeding rate will reach 60 percent.

The market economy and the introduction of media products and educational materials from developed countries have helped change Chinese people's attitudes toward romance, relationships, and sex. More and more females enter relationships at a younger age, and they sometimes experience unexpected pregnancies as a result. As abortion is legal in China, many of them choose abortions. There are approximately 5 million abortions every year, and more than half are performed on adolescents and young women. Some have multiple abortions within two or three years. Some adolescents choose live birth, which sets the adolescent birth rate at 8.6 births per 1,000 women aged 15–19 years old (UNDP 2015). Adolescent pregnancy is reflective of social and cultural changes in the Economic Reform Era and inadequate sex education in school; it has become an increasingly noticeable social problem that has negative impacts on mental and reproductive health.

The family planning policy has made effective birth control more important. The primary contraceptive methods couples use are intrauterine devices (IUDs) (53.7%) and female sterilization (30%). Men use fewer contraceptive methods (14.7%). This clearly indicates that women assume more responsibilities in birth control (NHFPC

2013) and reflects social, economic, political, and cultural pressures on women. On the one hand, women are usually forced to get IUDs after labor, whereas men can choose to have a vasectomy. On the other hand, male sterilization is irreversible and has a long-term impact on male fertility. If a couple loses their only child, it will be hard for them to be pregnant again. Moreover, vasectomies are wrongly associated with weakened masculinity, which also discourages men from participating in birth control that requires a medical procedure.

In addition to prenatal and postnatal care and family planning, two other health-related issues that need more attention are breast cancer and uterine diseases. Breast cancer is one of the leading causes of death for women in China, even though it is considerably low in population percentage when compared with other countries, including the United States. Nevertheless, it is still concerning because of a larger base population, which translates to a higher number of deaths. There has been an increase in the breast cancer death rate since the 1970s. Women in urban areas are affected the most, but more rural women have been diagnosed with breast cancer since 2000. Among breast cancer patients, the dominant age group is 40–50 years old. While some studies associate weight gain with breast cancer occurrences among younger women in China, some other factors, such as environmental pollution, stress, family history, or declined breastfeeding rates, may also impact younger women's health. Another common medical condition of the female reproductive system is cervicitis.

Sexually transmitted diseases (e.g., syphilis, chlamydia, and gonorrhea by prevalence in China) and HIV/AIDS infection also affect women's health, and they have increased shockingly in China. In 2011, 28.2 percent of the new HIV infections were women (UNICEF 2014). In 2012, among the 780,000 people living with HIV, 28.6 percent were female (UNAIDS 2016). Some provinces have seen an increase of over 40 percent in STDs and 108 percent in HIV/AIDS among women (SIH 2014). Female sex workers tend to have a higher rate of STDs and HIV infections (UNAIDS 2016). Women whose spouses are migrant workers are also a group at higher risk. On the other hand, many women in poor rural areas get HIV infections through paid blood donations, which have a negative impact on newborn babies. Given the stigma associated with STDs and HIV/AIDS, infected groups usually encounter discrimination at home and in the community. Many of them also hesitate to seek treatment for fear of financial burden or discrimination.

Women's mental health has direct impacts on their families, their personal lives, and society. Contrary to the global trend that more men have mental health problems and higher rates of suicide, more women have mental health problems (e.g., depression, anxiety, and schizophrenia by prevalence in China) and attempt or commit suicide in China. The last time China submitted reports on suicide to the World Health Organization (WHO) the male and female suicide ratios were 13 percent and 13.9 percent, respectively (WHO 2016). Other official or unofficial reports based on statistics from medical facilities and selected sources find that more women attempt or commit suicide, and women in rural areas have a much higher suicide rate than women in urban areas. Women assume more responsibilities at home, experience more stress in finance, share more housework and field work, encounter domestic violence, have limited access to social and health care support, or have little knowledge of resources. The most common method for suicide among women in rural areas is pesticide ingestion. The high rate of female suicides in China implies that women usually have more social pressure and stress and less emotional support or counseling services.

While women's health has improved since 1949, particularly in the Economic Reform Era, there are still many challenges to address. For example, the number of female smokers has increased, which in turn has directly caused smoking-related deaths among women; it will also affect women's reproductive health, including pregnancy. Some other challenges are securing more government funding to promote women's health, reducing high out-of-pocket fees, expanding insurance coverage, overcoming disparities in socioeconomic conditions and gender inequality in health care, addressing health care inequality between urban areas and rural areas, and providing effective services to help migrant women.

Employment

The socialist planned economy (1949–1978) made it possible for women and men to have jobs assigned to them based on their skills, training, and education. Women and men were paid the same if they had the same credentials, qualifications, experience, and rank, and they worked in the same units. However, planned economies were replaced by market economy in the Economic Reform Era, beginning in 1979. The old egalitarian model of income distribution and job assignments has been replaced by a

new growth model that adjusts access to recourses and the distribution of wealth and income. State policy intervention and regulations have created more opportunities for women to participate in economic activities and to access economic resources. Women now make up 45 percent of the nation's employed population. Approximately 29 million women own businesses, and approximately 55 percent of e-entrepreneurs in China are women.

Occupational segregation by gender is found in the Sixth National Census (2011). More women work in the service sector (51.7%) than men (48.3%). There are also more female professional skilled workers (51.1%) as opposed to 48.9 percent of male counterparts. Females and males engaged in agriculture-related professions are about the same in number (49% versus 50.8%). However, there is a significant difference in leadership and administrative positions. Only 25.1 percent are females, whereas 74.9 percent are males (2011). The same census also notes that there are more male white-collar workers and more female blue-collar workers.

Women are more likely to work in low-paying jobs, and they generally make less than men. Gender discrimination in employment is reflected not only in the gender pay gap, but also in the hiring process and the types of positions both men and women hold. Article 23 of Law of the People's Republic of China on the Protection of Women's Rights and Interests (2005 amendment) clearly defines women's rights: "With the exception of the special types of work or post unsuitable to women, no unit may, in employing staff and workers, refuse to employ women by reason of sex or raise the employment standards for women." Although the Chinese government has prohibited gender discrimination in employment, women still encounter gender-based inequality in the job search or in the workplace because there is no specific language regarding gender discrimination in laws. As a result, there is no legal enforcement against such discrimination, and very few women choose to file complaints or lawsuits.

Female college graduates have repeatedly reported gender discrimination in their job searches, irrespective of their high GPAs and work-related experience. Sex, age, appearance, marital status, and work experience are usually used to discriminate against female college graduates in the job market. Approximately 60 percent have reported hiring discrimination. More male college graduates are invited for job interviews than women who have the same education and experience level. Women with graduate degrees experience a higher level of discrimination when

applying for jobs; many of them must promise not to get pregnant while working. Many employers prefer to hire women who already have children to avoid paying maternity leave compensation.

Gender discrimination also exists in workplace promotions (Tatlow and Forsythe 2015), and the glass ceiling is difficult to break. Men get promoted faster than women with the same qualifications, and more men are in positions that require high skills and have good prospects (ACWF 2011). They also stay in leadership positions longer because women on average retire five years earlier than men. Even if women get promoted, they often take positions to assist male leaders and are not decision makers.

Family Life

Family structures and life have changed dramatically in China during the Economic Reform Era. The traditional large families whose prosperity depends on close kinship and many children, especially sons, have disseminated into smaller families because of a population control policy called the family planning policy (or one-child policy) (1979–2015); migration; and freedom of choice. As of 2015, there were approximately 43 million family households, and the average household size is 3.3 people (NHFPC 2015). Urban households are usually smaller in size than those in small towns or villages, where family planning policies make exceptions and more married couples live with aging parents.

Chinese traditions and culture aim to provide children with “a complete and loving home,” but divorce has become more tolerated in the Economic Reform Era. The Sixth National Census reports more than 40 million households in China (ACWF 2011). However, more homes have become single-parent homes (widows and other situations are not included). Divorce rates have risen for 12 consecutive years (2003–2015). Approximately 3.63 million couples were divorced in 2014 alone, an increase of 3.9 percent in comparison to 2013. The dominant group filing for divorce was born in the 1980s, and those born in the 1990s will soon see high divorce rates as well.

Although women’s social statuses have improved since 1949, traditional gender norms still play a major role in marriage. For example, gender norms are reflected in mate selection criteria. Men are traditionally expected to be superior to their partners in wealth and education so that they can take charge in family life. Therefore, women usually select a partner based primarily on the man’s

economic conditions, job, family background, certain assets, and academic degrees. Men’s assets, such as vehicles and real estate property, are frequently seen as desirable. Men, on the other hand, select women for their looks, gentility, health, age, and a certain level of education. Men’s age is not a major concerning factor as long as they are wealthy and successful, while women’s age can make a huge difference in their chances of finding mates. It is not uncommon to see a successful and wealthy man whose spouse is 15–20 years younger.

With social pressure to get married and have children, many women are marginalized if they are unmarried at a certain age. The minimum legal age for marriage is 22 for men and 20 for women. Even though the age at marriage is rising for Chinese couples, women are labeled “leftover” women if they are still single at the age of 27 (Fincher 2012). Some men even consider unmarried women at the age of 25 “leftover.” According to the National Bureau of Statistics of China (NBSC 2016, the overall sex ratio is 105.20 per 100, which means the male population outnumbers the female population by approximately 34 million; women should stand a better chance of finding partners. This, however, is not the case. The Sixth National Census (ACWF 2011) reports that “leftover” women usually hold more advanced academic degrees and live in metropolitan cities, such as Beijing and Shanghai. Whereas 37 percent of unmarried males aged 28–39 years old hold graduate degrees, 48 percent of unmarried females in the same age group hold graduate degrees.

Once again, what is considered success for men, such as advanced academic degrees, makes women in similar situations less desirable. The double standard is clearly embedded in gender-related biases. Irrespective of social pressure and age-related biases in relationships, there is a trend that more unmarried female professionals in big cities choose to remain single. They are economically independent and well-educated. They do not see marriage and children as the only purpose of their lives and prefer to live life according to their own choices.

Married women are expected to bear children. With the family planning policy, however, most of them have not had great pressure to have more than one child, whether they live in rural or urban areas. Married women in rural areas may have a second child if their firstborn child is a female, but the mother must be either older than 27 or wait for four years after the first child is born; otherwise, she will be fined by the local government. Married women from ethnic minority groups are also allowed to have more

than one child. Some may have up to three, depending on the size of the ethnic minority groups. Some birth defects can also lead to exceptions in some cases.

The birth rate is currently 12.49 births per 1,000 people, and the fertility rate is 1.6 children per woman in China—much lower than the total world fertility rate of 2.5 children per woman. This also means that the Chinese tradition of more children bringing prosperity to the family is not strictly observed because of state intervention. The enforcement of the family planning policy prevented approximately 400 million births in 30 years through preventive measures, such as contraception, and abortion. Although the policy has been criticized internationally for violating human rights, it has enabled many women to have more time for responsibilities other than childbearing and child-rearing. The family planning policy relaxed in 2014, allowing married couples to have two children if either parent is an only child. Nonetheless, many married couples have chosen not to have more children, which shows changing perspectives of family structure and child-rearing. On October 29, 2015, the Chinese government announced that all couples were allowed to have two children, finally putting an end to the one-child policy that was enforced for 35 years.

Giving birth outside of wedlock is not culturally accepted, and couples who do so are also heavily fined by the government in China. This is very different from the United States, where about 40 percent of births are attributed to unmarried mothers. Married women in China are required to obtain permission to get pregnant, regardless of their employment status. Unmarried pregnant women have more obstacles to continue with their pregnancy or deliver their babies. Many of them are also in a dating relationship with their boyfriends or a long-term relationship with married men, which makes them more vulnerable to separation or inadequate financial support. Consequently, they suffer psychologically, physically, and financially.

In cases of pregnancy out of wedlock, some couples choose to register for marriage if they are unmarried, and other couples separate if the pregnant woman does not want to terminate the pregnancy. Women who are in relationships with married men (usually elite and wealthy men) have to raise their children alone, but they often have financial support from their children's fathers. The relationship, on the other hand, may end in separation for various reasons, including the birth of an undesired girl instead of a boy. Whatever the case may be, the stigma associated with out-of-wedlock births usually traumatizes and adds shame

or pressure on unmarried mothers, who sometimes have to abandon their newborns, give them up for adoption, or keep them while facing cultural and social barriers.

Married couples who have fertility problems or who have lost their only child are allowed to adopt one child. The Adoption Law of the People's Republic of China (implemented in 1991 and amended multiple times afterward) states that adopters must meet the following requirements simultaneously: childless, capable of rearing and educating the adoptee, healthy, and 30 years old or older (NPCPRC 2007). Single women are also allowed to adopt children without age restrictions. Same-sex marriage is not legal in China, and therefore lesbian and gay couples are not allowed to adopt children together. The adoption law, however, allows men without spouses to adopt children, and there must be an age difference of 40 or more years if the men adopt girls.

In the meantime, because same-sex relationships are not legally protected or culturally accepted in China, many gay men pretend to be heterosexual and marry women. It is also not uncommon for a gay man and a lesbian to marry to avoid social pressure and stigma (Liu 2013). There are approximately 30 million gay men in China, 80 percent of whom are estimated to be married. Many gay husbands have children to carry on the family line, but they stop having sexual contact with their wives after the women get pregnant. Studies have shown that many women in these relationships suffer abuse, including domestic violence, and encounter sexual apathy with little to no sexual contact.

Politics

Political participation covers a wide range of activities, among which electoral participation is essential. After China was founded in 1949, women started to enjoy freedom of political participation. At the First Plenary Session of the Chinese People's Political Consultative Conference in 1949, 10.4 percent of the deputies were women, which was unprecedented at the time. For the first time, women were granted equal rights with men in political, economic, cultural, educational, and social life. The Electoral Law of the People's Republic of China (1953) clearly indicated that women had the same rights as men to vote and run for election. Approximately 90 percent of women voted in 1953 (CIA 2017), and some were elected as deputies to local people's congresses. A series of legal acts and amendments to the constitution have helped to further secure women's legal rights to political participation (NPCPR 2007).

From 1949 to 1976, women had a strong representation in the state government, assumed more leadership roles (He 2013), and had a higher electoral participation rate. In the Economic Reform Era, women's political participation has also increased, but with some obstacles. After the Fourth World Conference on Women in Beijing (1995), the Chinese government implemented a series of policies to elect more women to leadership positions on all levels. Changes took place by 2013. The ratio of women deputies to the first session of the 12th National People's Congress was 2.4 percent higher than 20 years earlier. The proportion of women members at the first session of the 12th Chinese People's Political Consultative Conference (CPPCC) national committee in 2013 was 4.1 percent higher than it was 20 years earlier. The ratio of female Communist Party members has increased by 8.7 percent since 1995. There are also more female members in all other political parties (other than the Communist Party). In the meantime, there has been an increase in the number of female civil servants at local levels, and more women participation in the management of state public affairs at the level of central government. Ethnic minority women deputies made up 41.3 percent of the total number of ethnic minority deputies.

Women in rural areas have also participated in local political activities, such as voting and serving as leaders. The Organic Law of the Village Committees of the People's Republic of China (1998) specifically rules that one-third of the village committee members must be women and assigns quotas for female villagers to serve on the village committee. The Program for the Development of Chinese Women (2011–2020) also states, "By 2020 the percentage of women in village committees will exceed 30 percent, and that female village committee heads should exceed 10 percent" and that "the ratio in neighborhood committees should be around 50 percent." The quota system seems to have made an impact. The majority of women in rural areas have participated in local elections, and more women have been elected as village committee members (22.8%) (NBSC 2015).

Notwithstanding an increasing number of female participants in political activities, the economic reform has inevitably manifested an adverse impact because of the changing election system the revival of gender stereotypes and practice of gender biases. The reform has caused more women to retire earlier or lose their jobs in the city and more women in the rural area to migrate to the city, and many of them are school dropouts; it has also created barriers for women in the workplace. Gender stereotypes of

leadership skills also lead to barriers to female political participation. As a result, the number of female deputies to the National People's Congress has slightly decreased, and the pool of qualified female candidates for leadership positions is small. Fewer women have been elected to leadership positions at all levels or cast their votes at elections.

Women in rural areas have been encouraged to participate in village self-governance, but their representation and participation has been low. One reason is that women in rural areas usually have fewer years of K–12 education than men and are not financially independent. Gender stereotypes and gender norms also play a role in discouraging women from full participation in politics. The deep roots of rural women's lower levels of political participation may also reflect corruption and fraud in elections.

The increase in the number of female leaders or committee members in the central government or at the local level does not necessarily translate into increased power for women. Few female leaders or committee members play primary leadership roles. For example, only 2.2 percent of women in the workplace assume primary leadership roles (ACWF 2011). Female leaders are also concentrated in family planning, education, and health organizations or job-related management and training duties. Few female civil servants work in law enforcement and criminal justice, which are male-dominated fields. There is also a decreasing number of female participants at senior administration levels.

Religious and Cultural Roles

Buddhism, Taoism, Islam, Catholicism, and Christianity (Protestantism) are the primary religions in China (Albert 2015). Although the Communist Party is atheist, the Chinese government has protected religious beliefs and practices since the national economic reform started in 1978. Article 36 of the Constitution (1982) ensures legislative support of freedom of religious beliefs and practices. The government's role is to protect religious activities that will not cause any harm to social orders, citizen's lives and health, and the state educational system.

Many studies have noted that the majority of the Chinese population is nonreligious. The Administration for Religious Affairs of China estimates that 100 million Chinese are religious. But 139,000 churches or worship sites are available for services, and there are also more than 100 educational institutions of theology. China Family Panel Studies (2010–2012)—a project conducted by Peking

University—reports that 89.56 percent of the population does not have religious beliefs and 10 percent of the population does. Buddhism is the more influential religion in China (6.75%), followed by Christianity (1.9%). However, Christians have more organized activities than Buddhists. Also, 58 percent of the religious population is female. Muslims and Christians reportedly mainly live in cities, whereas Buddhists live in small towns and villages. Buddhism appears to attract younger people and those with higher levels of education (Lu 2014).

More women attend organized religious activities than men. For example, more women worship respective deities in temples, especially at important ceremonies or festivals, wishing for more blessings regarding family affairs, children, health, fortune, or prosperity. Women between the ages of 65 and 69 make up the majority of the elders' religious population. Most of them are from ethnic minority groups and live in rural areas (77%). They also usually have fewer years of schooling or are illiterate. The religions practiced by elderly women are Buddhism (60.8%), Christianity (16.6%), Islam (15.6%), Taoism (3.4%), and Catholicism (2.8%) (Du and Wang 2015).

Issues

Inequality for Older Women

Inequality in retirement age in the workplace is an issue of concern. Women in China can retire as young as 45 years old if they are blue-collar workers. White-collar workers and professionals usually retire at age 55 (female) or 60 (male). Studies have shown that women in their fifties are less likely to be promoted to leadership positions because they approach retirement earlier than their male counterparts.

People with Disabilities

Another issue is job opportunities for people with disabilities. Statistics have shown a decline in their employment since 2010. Women with disabilities encounter more challenges (NBSC 2015) because of sexism and ableism. Although the central government has specific laws against discrimination, these laws are not fully enforced or implemented.

Gender-Based Violence

China has a series of laws and regulations to strengthen the protection of women and girls and the punishment

of perpetrators of gender-based violence. It has amended the Criminal Law of the People's Republic of China (2015) to include harsher punishment for crimes against female minors (rape and abduction) and for trafficking of both women and children. The first national law prohibiting domestic violence was enacted and protected both married and cohabited couples in 2015. It also clearly defined domestic violence as including psychological and physical violence. However, it did not specifically mention same-sex couples and sexual violence.

Although China does not have official data on all forms of violence against women, some reported major forms of violence against women include female feticide and infanticide, domestic violence, sexual assault, and human trafficking.

Female feticide (sex-selective abortion) and infanticide are also called *gendercide* and are a result of the traditional preference for having a son in combination with the implementation of the one-child policy (1979–2015). The impacts from sex-ratio imbalance and potential social instability are disturbingly huge. The Chinese government has taken preventive measures to stop female feticide. Ultrasounds to reveal a fetus's sex to expectant parents for nonmedical purposes are illegal, and health care providers will be harshly punished for violations. Unfortunately, organized underground and illegal ultrasound services are widespread and profit-driven. It is difficult to identify and punish abortion services that target selective abortions because abortion is legal. In May 2015, the Chinese central government launched a new campaign against fetal sex testing and selective abortions and made stricter regulations for purchasing ultrasound machines and abortion pills.

An increase in rape and unwanted sexual contact crimes has been documented and reported, even though there is not an official report from the central government. Victims of sexual violence are mainly female minors, college students, migrant girls, “left-behind” (*liushou*) girls who remain in villages while their migrant worker parents are absent, and girls in single-parent families. Sexual violence has been reported by female students ranging in age from primary school through college. Female minors living in remote rural areas are statistically more likely to be victims of sexual violence than their counterparts in urban areas; there have been increasing sexual assaults against minors under the age of 14 in those areas. Offenders are usually male teachers or school administrators such as principals. In those cases, victims are too young to process

relevant information because schools have no sex education classes. Family members are either absent migrant workers or they ignore signs of violence due to their trust in the teachers. Even if parents find out about the abuse, they often remain silent for fear of the stigma associated with victims of sexual violence and questioning authority.

In China, children's rights are protected under the Compulsory Education Law (1986), the Protection of Minors Law (1991), and the Law on the Prevention of Juvenile Delinquency (1999). With increasing sexual assaults against female minors, more activists and social workers are calling for laws and regulations to protect minor victims.

Sexual violence in college is also reportedly prevalent and affects female students more than males. While little data is available regarding the demographics of perpetrators on and off campus, faculty-inflicted sexual violence has frequently made headlines in the past few years. What makes college campuses in China different from those in the United States is that faculty-student relationships are tolerated, which creates barriers to separating coerced relationships from consensual ones and taking legal actions. China does not have a law, such as Title IX in the United States, for sexual violence in school. Campus resources to help students are also insufficient.

Like sexual violence, occurrences of domestic violence against women, children, and seniors have reportedly increased. The majority of victims are married women. Even though there is no official data on the prevalence of domestic abuse, law professionals have reported an increase in these cases in court. In a survey conducted by

a nonprofit organization in Beijing, 54 percent of female participants reported domestic violence, but 74.1 percent of them chose to remain silent (UNFPA 2013). Few victims seek assistance, which inevitably creates barriers to legal intervention and social support.

Domestic violence is a social and public health issue and affects victims socially, physically, and psychologically. There are three common types of domestic violence in China: emotional, physical, and sexual (UNFPA 2013). Victims often develop reproductive health conditions, anxiety, depression, and insomnia, or even commit suicide.

Gender inequality in relationships and family life and victim blaming contribute to female victims' silence. Many female victims are economically dependent on their intimate partners. Most of them are also mothers and prioritize their children's best interests over their own, not realizing that abusive relationships may have long-lasting negative impacts on children. In the meantime, violence report systems, such as hotlines, are inaccessible to many women. Domestic violence is treated like domestic disputes; no legal punishment for domestic violence is in place except some extreme abuse cases that cause, for example, death. Possible revenge from offenders may also contribute to victims' hesitation to seek legal and social help.

Human trafficking is another form of violence in which women are abducted and trafficked within or outside China and are forced to be sex workers, sweatshop laborers, or wives in remote rural areas. The 2016 *Trafficking in Persons Report* (or *TIP Report*) released by the U.S. Department of State estimated that approximately 294

Women's Voices

Li Tingting, Wang Man, Wei Tingting, Wu Rongrong, and Zheng Churan

Li Tingting (1990–), Wang Man (1982–), Wei Tingting (1989–), Wu Rongrong (1985–), and Zheng Churan (1990–) are “core members of China's new feminist movement.” “Media-savvy, fearless, and well-connected to feminists outside China, the young activists over the last three years have taken their righteous indignation to the streets, pioneering a brand of guerrilla theater familiar in the West but large unheard-of in this authoritarian nation” (Jacobs 2015). They were arrested on March 7, 2015 (the eve of International Women's Day 2015), detained, interrogated for 37 days, and released on April 13, 2015. These activists have provoked dialogue about sexual harassment, domestic violence, and discrimination against people with HIV. Chinese supporters have called them “the first modern, independent, grass-roots actors in China's history” (Jacobs 2015).

million internal migrants, including men, women, and children, are in particular vulnerable to human trafficking in China (DOS 2016). Reports of missing girls, boys, and women are very common. Female college students have been kidnapped on their way to school, children have been kidnapped while playing outside, and people have been kidnapped at train stations or in shopping centers. Some victims also become traffickers themselves. China has very strict laws against human trafficking. Some cases involve the death penalty, and the average prison time for traffickers is 5–10 years.

Concerns about domestic violence include relationships that are not legally recognized (e.g., same-sex couple or unmarried couples) and heterosexual women who are married to gay men and experience physical and emotional abuse, or even contract STDs or HIV. Also, given the larger aging population, more female seniors outlive their spouses and have to depend on their children or other relatives. There have been more reports that they experience domestic violence or neglect; some have committed suicide. The Chinese central government has committed to reducing and preventing violence against women, but there are many challenges to overcome. For example, the lack of thorough and detailed official reports will hinder effective policy making and implementation.

G

Guam

Overview of Country

Guam, an unincorporated territory of the United States, is the largest and southernmost island in the Mariana Islands archipelago. Guam's history is long and rich, with the indigenous Chamorro people inhabiting the island since 2000 BCE. Ancient Chamorro cultural values emphasized communal interdependence, familial relationships, and kin networks. The values and history of ancient Chamorro culture continue into contemporary Guamanian society.

The last 400 years of Guam's history are marked by a legacy of colonization, beginning with the Spanish, following the arrival of explorer Ferdinand Magellan in 1521. More than two centuries of Spanish colonial rule greatly influenced Chamorro culture and can still be seen today. Spanish words were incorporated into the Chamorro language, as were cultural traditions such as fiestas and the practice of Catholicism, which is practiced by 85 percent of today's Guamanians. Currently, English is the primary language on Guam and is used by almost 44 percent of the population. Other prominent languages on Guam include Filipino dialects, which are used by 21 percent of the population, followed by the indigenous Chamorro language, at almost 18 percent. The remainder of the population speaks a variety of other Pacific Islander and Asian languages.

Guam has a surface area of 210 square miles and features 77 miles of coastline. It has a tropical marine climate with little seasonal temperature variation and a rainy season that lasts from July to December. In 2014, Guam's population stood at 161,000 inhabitants, with the majority of people living in urban areas (CIA 2016). Currently, Chamorros account for 37 percent of the total population, followed by Filipinos at 26 percent, mixed-race peoples at 9 percent, and Caucasians at 7 percent. The remaining 21 percent of the population is made up of other Pacific Islander and Asian ethnicities.

Girls and Teens

Women have played an important role throughout the history of the Chamorro people and Guam. The history of Chamorro matrilineal family systems has continually influenced the island. Women continue to affect the preservation of Chamorro culture and are highly involved in familial, community, political, and business life on the island. Guam is not listed in the UN Development Programme (UNDP) Gender Inequality Index (GII) because it is an unincorporated territory of the United States. In 2013, the UNDP ranked the United States as 47th out of 187 on the GII.

Education

Prior to colonization, Chamorro children learned skills that were essential to ancient society, such as canoe making

and weaving. Formalized European-style education began on the island with the arrival of the Catholic clergy. The first Spanish school in Guam was a seminary that became fully operational in 1673 and remained open for more than 200 years (Rogers 1995, 50). Schools during the Spanish colonization era emphasized written language skills, such as reading and writing, as well as Christian doctrine. Children learned gender-specific subjects in schools: girls were taught cooking and sewing, and boys learned carpentry.

Under U.S. naval government, gender-segregated schooling continued. In 1917, Naval Government Executive Order Number 243 was enacted, banning the speaking of Chamorro except for translation purposes. This was applied to areas of public life, such as classrooms and on baseball fields. Additional general orders issued by naval governors continued to force the use of English, such as General Orders 12 and 13. General Order 12 dealt with the education system on Guam, emphasizing that classes should be taught in English, and General Order 13 instructed that all island residents should do their best to learn to read, write, and speak English. Education under the naval government faced problems of overcrowding and insufficient facilities. Following the reclamation of Guam from Japanese forces in 1944, the military government acted quickly to open new schools on the island (Rogers 1995, 201).

Currently, the Guam Department of Education oversees the public education system for the island. There are 39 public schools on Guam that serve nearly 32,000 students, including Head Start and kindergarten to 12th grade. In the 2012–2013 academic year, the Guam public school system had a graduation rate of 68 percent and an average dropout rate of 4 percent. Of the 32,000 students in Guam's education system, 47 percent are girls (Fernandez 2013).

Universities

Guam has two public institutions of higher education—the University of Guam and Guam Community College. Guam Community College was established in 1977 to serve secondary and postsecondary students on the island. The college manages all of the career-technical educational programs on Guam and offers adult education programs, including adult high school, English as a second language (ESL), the general education degree (GED), basic skills, and family literacy. The college also maintains important relationships with the island's public high schools through their programs of study. Guam Community College serves

close to 3,000 students, and women account for 55 percent of the student body.

The University of Guam is a four-year land-grant institution that serves almost 4,000 students. The university opened in 1952 as a two-year teacher training junior college and has since grown to offer an associate's degree program, 35 bachelor's degree programs, and 15 master's degree programs. During the fall of 2012, 59 percent of enrolled students at the University of Guam were women. The University of Guam offers an interdisciplinary minor and certificate program in Women and Gender Studies.

Sex Education

In 2011, the Risk Behavior Survey conducted in Guam's public schools by the Centers for Disease Control and Prevention (CDC) found that 49 percent of high school students reported having sexual intercourse, and only 32 percent reported that they use protection during intercourse. Two years later, the 2013 Guam Youth Risk Behavior Survey found that among high school students, 37 percent had engaged in sexual intercourse, and 59 percent of those students had not used a condom during their last sexual encounter. The 2012 Guam School Health Profiles shows that 100 percent of high schools on the island taught students how to access reliable health information related to HIV, STDs, and pregnancy in health education classes. However, only 75 percent of schools utilized a health education curriculum that addressed all eight national standards for health education. Additionally, none of the schools provided curricula or supplementary educational materials that engaged in the five practices related to lesbian, gay, bisexual, transgender, or questioning (LGBTQ) youth (CDC 2016). Outside of the school system, another resource for sexual education on the island is Guam Sex Ed, an organization that provides information on comprehensive sex education as well as other health and wellness resources available on Guam.

Health

Contemporary issues facing the youth of Guam include the use of tobacco, drugs, and alcohol and suicide. In Guam, approximately one in five youths smoke—a decrease from previous years. However, the use of smokeless tobacco products is rising among both adults and youth on the island (David 2012). The prevalence of teen drinking is also in decline; in 2011, nearly 25 percent of high school

students reported drinking. Teen girls use tobacco and consume alcohol at a comparable rate to boys on Guam, unlike their adult counterparts, who use at lower rates than men. Chamorro youth have the highest rates of tobacco use and alcohol consumption in Guam. Guam's youth use marijuana at a higher rate than youth in the United States in general, with one in three teens being current users.

Guam experiences high rates of suicide, with an average of one suicide every two weeks. Youth and young adults under the age of 30 account for 60 percent of suicide deaths on the island. Guam's Youth Risk Behavior Survey showed that girls in high school were more likely to report suicidal thoughts than their male counterparts. Youth suicides are related to gender-based violence, depression, substance abuse, and identifying as LGBTQ+ (David 2012).

Access to Health Care

In the 2014 State of the Island Address, Governor Eddie Baza Calvo stated that 91,000 people were insured on the island. The average private-sector insurance premium ranges from \$2,522 to \$2,734, and 48,000 low-income Guamanians can access health care through Medicaid and the Medically Indigent Program (Calvo 2014). The island of Guam has two hospitals, Guam Memorial Hospital and the U.S. Naval Hospital. In 2016, the Guam Regional Medical City, a private hospital, was opened. Access to health care in Guam, along with the other U.S. territories, has been complicated by the passage of the Affordable Care Act (ACA). The ACA consists of two pieces of legislation: the Patient Protection and Affordable Care Act and the Health Care Reconciliation Act of 2010.

American Samoa, Guam, the Northern Mariana Islands, Puerto Rico, and the U.S. Virgin Islands were not fully incorporated into the ACA, resulting in numerous questions on how the territories were to pay for and enact the health care marketplace. In 2013, the territories questioned their ability to carry out some of the provisions in the ACA, and the U.S. Department of Health and Human Services (HHS) responded that it could not choose which of the provisions could or could not be followed by the territories. However, on July 16, 2014, the Obama administration announced that the territories would be exempt from several provisions in the ACA, most notably that they had to provide insurance to all health care shoppers. The statement issued by HHS shared that the change in policy stemmed from recognizing the definition of "state" in the ACA did not include the self-governing territories.

Maternal Health

In 2012, Guam's birth rate was 22.5 births per 1,000 people, with a teen birth rate of 21.7 births per 1,000. In 2012, there were 27 fetal deaths—a fetal death rate of 7.4, which was a decrease from prior years (Office of the Governor of Guam, Bureau of Statistics and Plans 2014, 168). Fifty-six percent of women were reported to be breastfeeding at the time of discharge from Guam Memorial Hospital. Additionally, in 2013, 23 percent of children 19–35 months had received the full schedule of age-appropriate immunizations (Maternal and Child Health Federal-State Partnership 2016, 21).

Diseases and Disorders

In Guam, the life expectancy for men is 75 years and 81 years for women (Office of the Governor of Guam, Bureau of Statistics and Plans 2014, 168). According to health data collected from 2008 to 2011, Guam's leading causes of death were heart disease, cancer, cerebrovascular disease, diabetes, and septicemia (Calvo 2014).

Employment

The precolonial Chamorro economy was subsistence-based and primarily focused on fishing and agriculture, with work tasks shared by both men and women (Rogers 1995, 27–28). Ancient Chamorro society was divided by caste; upper-caste families controlled coastlines and the fishing industry, and lower-caste families worked the land (Cunningham 1992, 30). Men and boys fished along coastal terrain. Women managed the house, weaved, and made pottery. Men and women shared in child-rearing and worked in gardens and along reefs together (Souder 1992, 70). Under Spanish colonization, women worked as servants and cooks, did laundry, and exchanged sexual services (Souder 1992, 71). During the mid-20th century, the economy in Guam shifted from the pre–World War II modified subsistence economy to military construction and infrastructure jobs (Rogers 1995, 202).

Today, a thriving tourism industry and the United States' national defense spending largely constitute the contemporary Guam economy. The island's other largest industries are construction, transshipment services, concrete products, printing, publishing, food processing, and textiles. The 2010 estimated civilian labor force in Guam was 69,390, and the island has an 8 percent unemployment rate (CIA 2016). The largest occupations on Guam are management,

business, science, and arts professions, accounting for 28 percent of the workforce, closely followed by sales and office jobs at 27 percent. The next-largest occupation is in service industries at 21 percent, followed by natural resources, construction, and maintenance occupations.

According to a 2013 Guam Department of Labor report, women constitute 43 percent of the island's workforce. Organizations such as the Guam Women's Chamber of Commerce work to foster and support women's economic growth and leadership and to influence legislation that affects women. In 1991, the Guam government established the Bureau of Women's Affairs, which works with women to improve working conditions and advance opportunities for employment.

Family Life

Traditional Chamorro society evolved around the extended family unit, or clan, with women at the center. Chamorro society was matrilineal—family lineage was traced through the mother's family—and women were central in all aspects of decision making. The eldest daughter held an influential role in family decision making, and daughters lived with their family until marriage. Chamorro girls were taught to be strong and active women as they grew up. They assisted their mothers in religious ceremonies and around the home, and they learned the importance of family (Souder 1992, 58–59).

The matrilineal system in ancient Guam afforded women a central role in society as well as in family and financial decision-making processes. Women maintained property and inheritance rights. Ancient Chamorro society was segregated by a rigid three-tiered caste system. A woman's caste position helped to determine what duties she would be expected to perform throughout her life. Rank within the family was determined through the maternal lineage, with seniority beginning with great-grandmothers and grandmothers and ending with the youngest daughters. Elders were highly respected in ancient Chamorro society, and a respect for elders is still present in contemporary Guam.

Mothers played a central role in Chamorro culture. Chamorro women traditionally had very large families, and motherhood was central in the socialization process. Mothers passed on cultural values, language, and traditions to their children (Souder 1992, 58). Centuries of colonization have impacted many aspects of Chamorro women's lives. The Spanish and U.S. colonization eras ended the

Chamorro matrilineal systems and saw the increased role of men in the household as well as a restriction of women's roles. Contemporary Chamorro women still take care of family finances, are spiritual leaders in their homes and communities, and often take on legal and business affairs. Despite changes brought on by centuries of colonization, Chamorro women are still an essential part of family and society on Guam and have been central to the preservation of Chamorro culture and traditions.

Marriage

Marriage is an example of the many aspects of women's lives that changed during colonization. Precolonization Chamorros married within their caste, but outside of their family clan. The marriage of a couple was a contract between their clans. Grooms paid bride gifts to the woman's father, and a large celebration with a feast legitimized the marriage (Rogers 1995, 37). Girls typically married between the ages of 12 and 15, while boys generally married between the ages of 15 and 18 (Cunningham 1992, 122). If a marriage dissolved, the woman retained property, goods, and the custody of any children. Individuals were free to remarry at will, although men were always expected to pay the bride gift, even with multiple marriages.

During the Spanish colonial rule, traditional Chamorro marriage traditions blended with Catholic marital traditions. The primary change within this transformation was the lessening of women's marital control and an increase of the husband's. Under the U.S. naval government, civil marriage and divorce were instituted. At the beginning of the 20th century, the first naval government issued an executive order to ban cohabitation and having children out of wedlock (Souder 1992, 48). Additional executive orders decreed that women and children must take the surname of the husband. These laws were amended beginning with the 14th Guam Legislature, and women serving in the 15th Guam Legislature introduced further amendments designed to make marriage laws more equitable for both spouses (Souder 1992, 54).

According to the 2010 census, 50 percent of males in Guam were married, while almost 6 percent were divorced. Forty-nine percent of women were married, and almost 7 percent of women in Guam were divorced.

Sexuality

Early Spanish priests on the island documented women's sexuality in ancient Guam, noting the ways in which

it varied from European traditions. Prior to colonization, Chamorros were not fully clothed, as the environment did not necessitate it. Chamorros typically wore hats and coconut oil on their skin to protect them from the sun and sandals to protect their feet from the rocky shores (Cunningham 1992, 43). Traditionally, Chamorro women wore small aprons or grass skirts and did not wear clothing until fabric became available after the Spanish arrival.

There were no restrictions on premarital sexual behavior prior to marriage in ancient Chamorro culture. Women and men were free to engage in sexual activities outside of wedlock, and it was considered undesirable to marry a virgin. One of the ways that men and women practiced sexuality in ancient Chamorro society was through the *uritao*—a bachelor's house. Once men went through puberty, they moved into the *uritao* to learn a variety of skills, including canoe building, tool making, navigation, and sexual practices. Unmarried girls were selected to live in the house and help provide young men with sexual experiences. The men presented the girls' father with gifts. It was considered an honor for girls to be selected to live in the *uritao*, and this helped to raise family status (Cunningham 1992, 184). Children that were born out of premarital relations were accepted into the woman's family, as were children who were orphaned (Rogers 1995, 37).

The practice of living in *uritaos* ended with Spanish colonization, as the Spaniards viewed the cultural practice of premarital sex and having children out of wedlock as immoral. Restrictions on women's sexuality progressed throughout Spanish colonization, and with the U.S. naval government, Eurocentric models of femininity were enforced through varying societal expectations and regulations. By the mid-20th century, the sexual revolution in the United States was expanding societal expectations of sexuality, and this created more liberal attitudes about sex and sexuality in Guam.

LGBTQ Issues

In contemporary Guam, ongoing social debates about sexuality can be seen in the LGBTQ+ movement. In 2007, gay rights activists founded the island's prominent community-based LGBT nonprofit, Guam's Alternative Lifestyle Association (GALA). GALA works to improve the quality of life for lesbian, gay, bisexual, and transgender Guamanians and their allies through support, education, and advocacy. According to the 2012 School Health Profiles, 55 percent of the high schools on Guam have a gay-straight alliance or similar clubs.

Before 2015, Guam did not have nondiscrimination laws in place for LGBTQ+ residents, and marriage was legally defined as between one man and one woman. In 2009, the Guam legislature saw the first attempts to address the legal status of LGBTQ+ couples and antidiscrimination policies, but none of the bills that were introduced passed. On June 5, 2015, a federal judge struck down Guam's law banning same-sex marriage, citing an October 2014 ruling by the U.S. Court of Appeals for the Ninth Circuit that declared similar bans in Idaho and Nevada unconstitutional. Guam became the first territory to issue same-sex marriage licenses on June 8, 2015. On August 11, 2015, the Guam Legislature passed Bill 102, the Guam Employment Nondiscrimination Act, which extends workplace discrimination laws to protect LGBT workers.

Politics

The UN Special Committee on Decolonization lists Guam as 1 of 17 nongoverning territories in the world today. As Guam is an unincorporated territory of the United States, Guamanians are citizens of the United States, but the island receives no votes in the Electoral College and has one non-voting member of the U.S. House of Representatives. An elected governor and an elected unicameral 15-member legislature manage the government of Guam.

The involvement of the United States in the governance of Guam began in 1898 with the signing of the Treaty of Paris, when Spain ceded the island to the United States at the end of the Spanish-American War. At that time, Guam's residents were not yet U.S. citizens, and the island was placed under the control of the Department of the Navy. Naval governors administered the government of Guam until World War II, when the island was briefly occupied by Japan. The Japanese Imperial forces controlled the island from 1941 to 1944. During this time, Chamorros were subjected to forced manual labor, physical injuries, sexual assault, and internment in concentration camps (Souder 1992, 34). In August of 1950, six years after the United States regained control of the island from Japan, President Truman signed the Organic Act of Guam, which granted Guamanians U.S. citizenship.

Since the United States began its presence in Guam, a long process of Americanization has evolved. Laws, policies, infrastructure, culture, and media have all been influenced by an influx of military personnel, government employees, and civilians from the United States. Prior to and following World War II, the U.S. military has accrued

land from indigenous Chamorros to accommodate military installations. In 2014, the U.S. military occupied one-third of the land on the island of Guam, with four branches of the military present: the navy, air force, army, and Coast Guard (Santos-Bamba 2010). In 2006, the United States announced that Guam was slated to receive more than 8,000 marine servicemembers and their dependents as the U.S. military transfers them from the base in Okinawa, Japan. Guam continuously experiences a growing economy and shifts in population due to the military buildup and as Chamorro populations leave the island. Chamorros have left Guam for a variety of reasons, but some common factors include moving for education and to join the military. According to the 2010 U.S. Census, 40 percent of Chamorros live outside of Guam.

In ancient Guam, women held considerable political power within the matrilineal clan system. As women's roles shifted throughout the process of colonization, so did their political autonomy. During the Spanish colonization, women maintained some of the legal rights they had possessed throughout precontact Chamorro society, including the ability to own property and enter into contracts. The U.S. naval era saw strict restrictions on the rights of Chamorros, including the implementation of English-only policies in schools and public places, and Chamorro was only allowed for translation purposes. In 1917, Naval Governor Roy Smith (1858–1940) created the First Guam Congress, though only men served as legislatures until the mid-20th century.

By 1931, women were eligible to vote and run for the legislature on Guam. Women have served in the Guam legislature since the mid-20th century. In 1946, the first woman was elected to the Guam Congress, Rosa Aguigui Reyes (1915–2007). In addition to being the first woman to serve in the Guam Congress, Rosa Aguigui Reyes was also part of the first graduating class of the College of Guam, receiving an associate's degree in education in 1954. Between 1946 and 1950, six women served in the legislature. The next two decades saw a decrease in female legislators, with only five women serving between the years 1953 and 1978 (Souder 1992, 76).

In 1978, community organizer and businesswoman Cecilia Cruz Bamba (1934–1986) was elected to the 15th Guam Legislature. During her tenure as a senator, Bamba served on more than a dozen committees, working tirelessly toward reparations for Chamorros who suffered during the Japanese occupation of the island during World War II. The closing decades of the 20th century

saw another rise in women legislators in Guam. Between 1983 and 1994, over two dozen women were elected to the Guam Congress (Drage 1995, 65). In 2016, in the elected 33rd Guam Legislature, there are four women legislators.

Religious and Cultural Roles

Ancient Chamorro legends depicted a female spirit as the life-giving force and controller of the environment (Souder 1992, 64). Women played an important role in many Chamorro rituals, such as funerals and weddings. Chamorro women also served important cultural roles as healers and midwives. Traditional midwives, *pattera*, were predominantly used until the post–World War II era on Guam and were only granted the title of *pattera* after many years of apprenticeship (McGrath 2002, 497). In particular, *suruhana* roles have persisted from ancient to contemporary society. *Suruhanas* are women who care for the physical, mental, and spiritual well-being of Chamorros through the use of herbs and, in some cases, prayer (Souder 1992, 66).

With the arrival of the Spanish, Catholicism became, and still remains, a central part of Chamorro women's lives. The conversion to Catholicism instilled new cultural expectations for Chamorro women. The Virgin Mary became an idealized figure; restrictions were placed on women's sexual autonomy, and this repositioned women's authority within the family and church (Souder 1992, 68). Women and girls are active members of their communities, participating in church organizations as well as other community development and support activities. The Guam Women's Club is the oldest women's organization on the island. It was started in 1952 by Cecilia Cruz Bamba (1934–1986). The club is a volunteer nonprofit organization dedicated to improving life on Guam by addressing issues related to the welfare, health, and education of the people of Guam through volunteerism, fund-raising, educational scholarships, and lobbying for community improvements.

Issues

Self-Determination

Guam's history is marked by a legacy of colonization and the resistance by the Chamorro people. Their pursuit for self-determination was demonstrated by the Chamorro uprisings throughout the Spanish-Chamorro War (1680–1696) and continuous efforts for self-governance and self-determination into the 21st century. During the first

naval government (1898–1941), Chamorros formally petitioned the U.S. government multiple times on the issues of civil rights and self-governance for Guam. In 1917, when the Guam Congress was established, Chamorro leaders used their position as legislators to advocate for U.S. citizenship and civil rights (Rogers 1995, 138). Following the Japanese occupation of Guam during World War II, the U.S. naval government continued to control the administration of Guam. Chamorros continued to spearhead Guamanian efforts to establish self-governance through formal petitions.

Conflicts over the naval rule of Guam peaked in March 1949, when members of the Guam Congress walked out in protest of the naval government's treatment of Chamorros and in support of an organic act for Guam. The walkout garnered national attention in the United States and helped to spur President Harry Truman to address the political situation in Guam, requesting the State Department do an assessment. Following the assessment, President Truman instructed the navy to transition the governance of Guam to the Department of the Interior within 12 months (Rogers 1995, 220). Additionally, President Truman instructed the Department of Interior to draft an organic act for Guam, signing it into law on August 1, 1950. While the Organic Act established U.S. citizenship and released Guam from naval rule, Guamanian leaders have continually sought to address further issues of self-determination and decolonization.

Two legislative political commissions were established in 1973 and 1975 to assess Guam's political situation. The 1973 political commission report listed nine complaints against the U.S. government and called for a constitution and assessment of the military presence (Rogers 1995, 250). In 1975, the political commission was tasked with assessing the peoples' views on Guam's political status and representing Guam in negotiations with the U.S. government. In 1976, the second political status commission held a public referendum on the political status of Guam, listing five options: statehood (24%), improved status quo (58%), status quo (9%), independence (6%), and other (3%) (Rogers 1995, 262).

Following these political status commissions in 1980, the first Commission on Self-Determination was established. The commission was tasked with creating a referendum to determine a new political status for Guam, but it faced many questions, including issues of defining self-determination and Chamorro self-determination. Ultimately, two referendums were held to decide the

public opinion, with the majority voting for commonwealth status (Rogers 1995, 271). A second Commission on Self-Determination was established and continued to work on Guam's Commonwealth Act. Since the 1980s, the Commonwealth Act has been revised and put on hold throughout changes in political administrations. In 1997, the Commission on Decolonization took over the work of the Commission on Self-Determination and continues to work toward changes in Guam's political status.

U.S. Military Buildup

On February 17, 2009, U.S. Secretary of State Hillary Clinton and Japanese Foreign Minister Nakasone Hirofumi signed the Guam International Agreement, allowing for the transfer of U.S. Marine Corps personnel and their dependents, an estimated 17,000 people, from Okinawa, Japan, to Guam (Camacho 2012, 698). This move was intended to strengthen the U.S. military's ability to deploy troops to Iraq and Afghanistan, to prevent terrorist organizations from moving across the Pacific, and to deter nuclear threats, such as those associated with China and North Korea (Camacho 2012, 698). This move poses logistical challenges for the small island, including adding additional pressure to such services as public schools, social and medical services, and housing and to infrastructure, such as roads, water, and power supplies (Owen 2010, 309). The military buildup also poses other possible challenges to resident Guamanians, such as access to bidding opportunities for the necessary construction work for existing business and access to jobs.

A variety of Chamorro organizations are engaged in activism against the military buildup on Guam. This activism builds on the work of Guam's Commissions on Decolonization and Self-Determination. The presence of thousands of additional U.S. troops and their dependents continually presents challenges to the preservation of Chamorro language, culture, and lands (Owen 2010, 309). The Chamorro women's activist group Fuetsan Fama-lao'an works to build coalitions among Chamorros and non-Chamorros and has been active in organizing against the military buildup. In 2009, Guam was the location for the International Women's Network against Militarism conference, and the women of the conference drafted a letter to President and Mrs. Obama directly addressing the issues associated with the military buildup on Guam (International Women's Network against Militarism 2010). Organizations such as the Guam Landowner's Association,

Nasion Chamoru, the Organization of People for Indigenous Rights, and We Are Guahan have all worked toward the decolonization of Guam (Camacho 2012, 700).

Gender-Based Violence

Gender based violence on Guam impacts women across the island. According to the Guam Police Department, in 2006, there were 1,035 reported cases of domestic violence on the island. Of these incidents, 77 percent of victims were women, 21 percent involved sexual assault, and 14 percent required medical treatment for the victims (University of Guam Violence against Women Program 2014). Activists on Guam, such as the Guahan Coalition for Peace and Justice, who were involved in protesting the U.S. military buildup on the island, cite violence against women as one of the many reasons for preventing the transfer of thousands of troops to Guam. Female Chamorro activists on Guam cite the work of other indigenous women organizing against militarized violence, such as the Okinawa Women Act against Violence, to address the ways in which U.S. military presence increases rates of violence against women and girls (International Women's Network against Militarism 2010).

Abortion

Abortion on Guam has a long history. It was first noted as a resistance strategy women used against the Spanish during the Spanish-Chamorro War (1680–1696) (Souder 1992, 75). Following the war, Spanish visitor accounts documented Chamorro women aborting pregnancies to prevent further repression by the Spanish colonizers (Rogers 1995, 71). In the 20th and 21st centuries, access to abortion has been difficult for women on Guam. In 1973, the U.S. Supreme Court ruled via *Roe v. Wade* that women have the right to abortion services, and as an unincorporated territory, this ruling applies to the island. In 1990, the Guam legislature passed a restrictive abortion law that had no exceptions for cases of rape or incest, only for the life of the mother. The U.S. Supreme Court overturned this law in 1992, guaranteeing women the right to an abortion through the sixth month of pregnancy. In 2012, the governor of Guam signed into law a mandatory 24-hour waiting period for women seeking abortion. The law also requires that women seeking an abortion must be given information about alternatives to abortion services and risks associated with the procedure. These restrictive measures are part of a larger political trend across the United States.

Recreation

There is a long history of youth recreational and social groups on Guam. Today, there are a variety of recreational activities for girls and teens, such as traditional Chamorro dance groups in schools and community organizations. Recreational outlets are also offered by organizations such as the Girl Scouts. The Guam Girl Scouts have been active for 72 years, and as of 2014, there were 26 troops across the island. Other organizations, such as the local prevention program Island Girl Power, offer positive activities and role models for girls aged 7–14.

As an unincorporated territory of the United States, Guam is subject to U.S. laws such as Title IX, which directly affects girls' education and access to sporting programs. In 1972, Title IX of the Education Amendments was enacted, protecting individuals from sex-based discrimination in educational programs and activities that receive federal financial assistance.

In Guam, sports such as baseball and soccer are popular activities. Baseball gained popularity on the island during the U.S. naval government era in the 20th century, which had a sanctioned Little League charter established in 1967. Football, or soccer, has gained popularity on Guam since the 1970s. The Guam Football Association was established in 1975 and offers women's, youth, and all-girls leagues.

India

Overview of Country

The Republic of India is the largest country in South Asia. It is surrounded by the Arabian Sea and the Bay of Bengal and borders Bangladesh, Bhutan, China, Myanmar, Nepal, and Pakistan. Geographically, it is the seventh-largest country in the world covering a total land area of 1,269,219 square miles (or 3,287,590 sq. km). India has a diverse topography; the northern states of the country partly adjoin the Himalayas, the central and eastern states are mostly fertile land, the Thar Desert lies in the west in the state of Rajasthan, and southern India contains the Deccan Plateau and coastal ranges.

Historically, the roots of the Indian nation trace back to the Indus Valley civilization, a highly sophisticated society that flourished from around 2500 to 1900 BCE. After various periods of invasion by rulers who brought Hinduism, Jainism, and Buddhism to the country, Arab, Turkish, and Persian invaders spread Islam across the subcontinent in the early 8th century CE. By the early 16th century, the Mughal Empire was established in India by Emperor Babur. It lasted for over three centuries, during which time European explorers and traders found their way into the main coastal and trade regions of the country.

The arrival of the British in the 19th century established the British Raj as the dominant political and economic

power in India as well as in the rest of the subcontinent, including present-day Bangladesh and Pakistan. At the peak of imperial power, the Indian revolt of 1857 led to a period of deep rebellion and warfare known as the Great Mutiny, often considered India's First War of Independence. British imperial rule lasted until 1947, when the first steps toward independence began to take shape, led by Mahatma Gandhi's nonviolent movement and by Jawaharlal Nehru, who went on to become India's first prime minister. India gained independence from the British on August 15, 1947. The Muslim-majority areas of India broke away and joined the nation of Pakistan, leading to years of partition, refugee resettlement, and communal conflict. Officially, the Constitution of India came into effect on January 26, 1950, and the new Republic of India was established.

India's population was 1.2 billion as of 2015. It is the second most populous country in the world after China (UN Statistics Division 2016). It houses a diverse multi-ethnic and tribal population of more than 2,000 ethnic groups with ancestral roots in various parts of the world. There are hundreds of languages in India and numerous minor dialects that make up the linguistic landscape, but they all fall within four different language families. About 72 percent of the population speaks a language in the Indo-Aryan family, while roughly 24 percent speak a language in the Dravidian family (Office of the Registrar General & Census Commissioner, India 2001a). The remaining

languages are in the Austroasiatic and Sino-Tibetan language families. The official languages of India are Hindi and English; Hindi is the most widely spoken language and is spoken by approximately 40 percent of the population. Other languages that have been given official recognition are Assamese, Bengali, Bodo, Dogri, Gujrati, Kannada, Kashmiri, Konkani, Maithili, Malayalam, Manipuri, Marathi, Nepali, Odia, Punjabi, Sanskrit, Santali, Sindhi, Tamil, Telugu, and Urdu.

India's religious diversity is a central part of its culture and identity and is upheld in the law and within the constitution of the country. Some of the world's most prominent religions trace their roots to India, including Hinduism, Buddhism, Jainism, and Sikhism, which have played an important role in influencing the cultures of various parts of Asia. Hinduism is the primary religion of India, with almost 80 percent of Indians considering themselves Hindu (Office of the Registrar General & Census Commissioner, India 2011). Islam is the second-largest religion and constitutes more than 14 percent of the population. Other religions include Christianity (2.3%), Sikhism (1.7%), Buddhism (0.7%), and Jainism (0.4%). A significant segment of the population also adheres to other religions (about 0.7%), such as Zoroastrianism and the Baha'i faith, while others ascribe to no particular religion (0.2%).

As the world's largest liberal democracy, India has seen increasing global economic prosperity in recent decades. India is the third-largest economy in purchasing power parity after China and the United States, and it is one of the world's fastest-growing economies. The technology and telecommunication industry in India is the fastest growing in the world and is a major hub for some of the most prominent software and technology companies. However, despite its steady progress, India still faces economic inequality, poverty, and various societal challenges.

Overview of Women's Lives

The 2014 UN Development Programme's (UNDP) Gender Inequality Index (GII) ranked India 130th out of 188 countries for gender disparity in the areas of reproductive health, empowerment, and economic status (UNDP 2014). Despite efforts to improve economic opportunities for women through microcredit programs and increased political participation, women remain at a deep disadvantage vis-à-vis their male counterparts. Women's access to, and increased participation in, entrepreneurship remains among the lowest in the world, which is a significant

contributing factor to gender inequality. Lack of education, cultural expectations, and extreme poverty are some of the major challenges Indian women face in their pursuit of economic freedom.

The Constitution of India provides legislative safeguards and mechanisms to protect women's social, political, and economic rights, and it maintains that all citizens have equal status and opportunity. However, social structures have not responded as quickly to laws, cultural attitudes in society still discriminate against women based on their sex, and issues such as sexual violence against women continue to increase. At the bottom of the social hierarchy are women from the Schedule Caste or Dalit communities, who face multiple discrimination at the intersections of sex, caste, and class position, and they are also removed from legal protection.

India's LGBT community has found spaces of engagement in some of the largest metropolitan cities in the country, namely, Delhi, Mumbai, Kolkata, and Chennai. However, because of major social stigma, LGBT individuals continue to face discrimination in various facets of society, including employment and access to services. Seen as a taboo issue in Indian society, lack of understanding and knowledge around sexual orientation and gender identity cause many members of the LGBT community to remain closeted.

Girls and Teens Family Roles

Girls and teens in India face various cultural and religious expectations based on the traditional roles of women in the country. Despite free and mandatory education until the age of 14, illiteracy among girls remains high, mostly due to gender discrimination in the family. Traditionally, there is a conservatively held belief that the birth of a boy is more blessed than the birth of a girl. Parents tend to favor boys from a young age because boys are seen to be more industrious and useful for helping the family business or for agricultural activities in rural areas. Girls, on the other hand, are seen to be burdens because they will eventually drain resources from the family through the payment of a dowry at marriage. Early marriage of young girls and adolescents is a prevalent issue, specifically in rural areas. As many as 26 percent of girls are married by the age of 15, rising to 54 percent by the age of 18, with higher percentages in rural areas (Banerjee and Gesser 2004).

Sex Education

Though social changes are gradually taking place concerning sex, sexuality, and marriage, dating and premarital sex are generally not accepted in most traditional families for girls, although they are more accepted for boys. Chastity is held at a higher standard for girls, and girls are traditionally expected to maintain their virginity until marriage. Sex education and information for girls is very limited, and any discussion of sex usually begins with marriage. Education on sexuality, safe sex, and preventative behavior is often nonexistent for teens in India, especially in rural communities, which makes it difficult for girls to prevent unwanted pregnancies.

Extracurricular Activities and Recreation

Family is the most important institution in India, and a large part of a girl's social life surrounds the family. Recreation and extracurricular activities can often be restricted to festivals, sports, and movies or television. Girls usually help prepare elaborate meals that are an important part of festivals, such as Diwali and Baisakhi. Traditional Indian dancing is also a big part of Indian culture, and girls take dance lessons during their spare time. Indian television

shows, drama serials, daily soaps, and Bollywood movies are also a huge draw for teenage girls.

Education

Due to its population, India has the second-largest education system in the world. With some of the best universities and institutes of higher education, India has positioned itself as a global leader in quality education. The Ministry of Education is responsible for providing education to all, funded by both the public and private sectors from all levels of government: central, state, and local. The Right of Children to Free and Compulsory Education Act 2009 in the Constitution of India stipulates that all children up to the age of 14 shall receive free and compulsory primary school education. India has made significant progress in improving literacy across the country since the late 20th century, achieving 74.04 percent in 2011, up from 12 percent at the end of colonialism in 1947 (Office of the Registrar General & Census Commissioner, India 2011). Despite this, one-third of India's population currently remains illiterate.

Preprimary school is optional and includes lower and higher kindergarten. Universal compulsory primary

The Reservation System

Historically, access to education and other resources was determined by caste. Official affirmative action policies were implemented in the 1940s under colonial British rule. When India gained independence, these policies were written into the constitution. The affirmative action project took three main forms. It pledged to reserve a population-linked ratio of legislative positions, government jobs, and places in educational institutions for members of scheduled castes (SC) and scheduled tribes (ST). In 1990, reservation privileges were extended to members of what are called "other backward classes" (OBC). Reservation quotas assigned to various groups at the national level are SCs 15 percent, STs 7.5 percent, and OBCs 27 percent. Higher education for OBCs is almost entirely state-funded.

Also at the time of independence, the government developed the Planning Commission to determine national priorities and formulate plans for the most effective use of resources. The most recent plan covering 2012–2017 still includes a focus on the use of the reservation system to enhance access to higher education for students belonging to SC/ST/OBC and the disadvantaged. Gender reservations are trumped by SC/ST/OBC. For example, a seat reserved for a girl from an OBC would be transferred to a boy from an OBC rather than to another girl from the open-merit category. Strong opinions exist among those in favor of the reservation system, as well as among those arguing for its abolishment.

In 1949, women made up 10.4 percent the higher education population. Today, that number is 41.6 percent. Since gaining independence, the literacy rate has steadily increased. Female literacy has grown from 8 percent in 1951 to 64 percent as of the 2011 census. The male literacy rate reported in 2011 was 80 percent. Globally, India has the most higher education institutions and ranks second in terms of enrollment numbers.

—Whitney K. Archer

school education was developed under the *Sarva Shiksha Abhiyan*, or Education for All Movement, as a fundamental right of all children. Primary school education consists of primary and upper primary or middle school education and lasts seven or eight years, depending on the state, for children ages 6–14. Enrollment in the country has increased to at least 96 percent since 2009 due to various efforts to improve access to education in remote areas (Sahni 2015). However, universal education at the primary level has proved challenging, especially in rural areas, because access to education for poor children is limited, coupled with the difficulty of maintaining quality education. Part of this universalization process includes attempts by the government to enhance the quality of primary schooling through the launch of the District Education Revitalisation Programme (DERP) in 1994. Funded by the government, the goal of DERP was to reform and improve the primary education system through the development of new schools, including alternative schools. Despite these efforts, dropout rates remain high, with 29 percent of children dropping out before completing five years of primary school and 43 percent before finishing upper primary or middle school (Sahni 2015). The lack of resources in schools has resulted in a shortage of teachers, poor teacher training and accountability, and a high student-to-teacher ratio.

Secondary school education for pupils aged 15–18 years includes preparation for both vocational institutes and universities. The Rashtriya Madhyamik Shiksha Abhiyan (RMSA), or National Mission for Secondary Education, was developed by the government in 2009 to reform and improve the secondary education system. As a result, 10,082 new schools are presently functional, and 20,839 classrooms have been added (RMSA 2016). Efforts to include disadvantaged groups and minorities in society were also established. Alongside government-funded schools are private schools, where English is the primary language of instruction.

The central government and state governments control tertiary education (postsecondary), universities, and polytechnic schools in India, and the higher education system has expanded significantly since independence. Technology and science are the primary focus of tertiary education in India. Some of the best institutions in India are in these fields, including the world-renowned Indian Institutes of Technology, the Indian Institutes of Management, and Jawaharlal Nehru University. Despite the growing number of institutions and universities, critics assert that

the quality of instruction has declined and fails to match prominent institutions worldwide. Lack of employment after graduation is also an issue, particularly for graduates with liberal arts degrees.

Women's Access to Education

The central government of India has made efforts to promote the education of girls and socially disadvantaged groups, such as Scheduled Castes and Scheduled Tribes. Some of these efforts have included grant opportunities for particular programs and reimbursement of tuition for girls in secondary school. While India has made concerted efforts to reform and revitalize the education system, education levels for women remain significantly low compared to men. A little less than 50 percent of the entire female population in India above the age of 15 is illiterate, and females 15–24 years old have a literacy rate of 74 percent (UNESCO 2013). Illiteracy among women in rural areas is particularly high, especially women from socially marginalized minorities and lower castes. Female literacy rates are also disparate, depending on the state. For example, female literacy in Uttar Pradesh (North India) is about 52 percent, while Kerala (South India) has a female literacy of about 86 percent (UNESCO 2013).

Gender issues in the education system, coupled with patriarchy in the country, are the primary reasons for the lower educational levels of females as compared to males. Due to conservative cultural attitudes, a majority of girls from poor rural communities have household chores and family responsibilities that prevent them from attending school, while their male counterparts receive more educational opportunities. Other issues, such as early marriage or the importance of “maintaining family honor,” also hinder girls’ access to education. Inadequate facilities and resources at the primary level are another major concern, alongside the shortage of female teachers. Only 53 percent of primary schools have functional girls’ toilets; schools fail to adequately provide safe and sanitary facilities for girls and prioritize reserving new facilities for boys (Sahni 2015).

The government launched the nationwide Saakshar Bharat Mission for Female Literacy in 2009 under the Indian Department for School Education and Literacy with the aim of reducing female literacy by half and working to bridge the gaps between male and female literacy. Specifically, it promotes and strengthens adult learning for women who were not able to receive or had no access to

formal primary education. In addition to basic literacy, the program also provides vocational training and skills development as well as courses on applied science and sports (UNESCO 2013).

With regard to higher education and universities, accessing the technical and vocational education system has proved difficult for women, though the enrollment rate has been increasing in recent years. Women have an enrollment rate of 24–50 percent in tertiary education, though there is still a significant gender imbalance within various fields of study. Women predominantly study liberal arts subjects and account for less than 10 percent of students in the science and engineering fields (Saraswathi and Verma 2002).

Health

The role of gender inequalities in women's access to reproductive health care in India is intrinsically rooted in various cultural and gender expectations of women and their status in society. Family members sometimes overlook women's health issues and perceive them as economic burdens, as preference is given to the men of the household. Health care professionals may also dismiss female issues as real health problems. As a result, many illnesses go unreported or untreated and have serious repercussions in other aspects of a woman's life, including pregnancy, child care, and loss of productivity in the labor force.

Access to Health Care

The World Health Organization (WHO) ranked India's health care system 112th out of 190 countries, bringing to light the great disparities in access to health care for various groups in Indian society (WHO 2000). The health care system is dominated by the private sector in urban areas, while many rural health care facilities are government funded. Seventy percent of urban households and 63 percent of rural households use the private medical sector (IIPS and Macro International 2007). Private health care facilities are expensive, and most patients must pay out of pocket, which makes access to high-quality private hospitals and clinics a challenge, particularly for rural populations. Health insurance is available in some cases, which is provided by employers, but it is generally inaccessible to the poor.

Consequently, most rural communities rely heavily on alternative medicine and publicly funded government

health care facilities. Despite almost 70 percent of the population living in rural areas, these people are supported by only 2 percent of the country's doctors (Britnell 2015). The quality of facilities in the public health care system is reduced because many qualified doctors and nurses are reluctant to practice in rural areas. A shortage of physicians coupled with long wait times, inexperienced interns, and a lack of availability make access to health care relatively difficult for rural women. In an effort to increase access to quality health care for rural communities, the Government of India has established national health programs, such as the National Rural Health Mission (NRHM). The NRHM was launched in April 2005 with the goal of providing effective health care to rural populations throughout the country, focusing specifically on states with weak infrastructure and public health indicators (Choudhury and Kapil 2005).

Many poor rural women seeking access to health care resort to alternative natural medicines that are often provided by other women in the community. The use of herbs and traditional medicines has been passed down for generations from grandmothers and mothers. Alternative medical treatments include Ayurvedic medicine and homeopathy. As access to professional facilities, including government hospitals, is often limited, poor women find traditional medicine to be a more reliable source of health care.

With the label of "untouchable," discrimination is rampant for Dalits, even in terms of health care. Human Rights Watch (HRW) notes that in 21.3 percent of Indian villages, Dalits were denied entry into private health care facilities (HRW 2007). Additionally, about 40 percent of health care workers refuse to visit Dalit communities, forcing many Dalits to go untreated. For Dalit women, access to health care is often close to impossible, specifically for maternal health issues. In their attempts to access health care for themselves and their children, Dalit women face severe discrimination from midwives, nurses, and community health workers. In some cases, they are wrongfully charged fees for supposedly free services, limiting their utilization of free health care options. In other cases, clinics and community health centers practice "untouchability," where doctors refuse to treat pregnant women at all; the women must give birth without the help of trained medical personnel (Borooah et al. 2012). In cases where health care professionals do provide services to Dalit women, they are often disrespectful and use rude and insulting words, leading Dalit women to

The Day We Woke Up as Criminals

On December 11, 2013, the Indian Supreme Court overturned a July 2009 Delhi High Court verdict that had decriminalized private, adult, consensual sexual acts. The ruling upheld Section 377 of the Indian Penal Code (IPC), which resulted in lesbians, gays, bisexuals, and transgender (LGBT) people across India waking up to find themselves declared criminals.

Section 377 was incorporated into the IPC in 1860 and is a legacy of colonial British rule. The section reads, “377. Unnatural offences—Whoever voluntarily has carnal intercourse against the order of nature with any man, woman, or animal, shall be punished with imprisonment for life, or with imprisonment of either description for a term which may extend to ten years, and shall also be liable to fine.” The section defines sexual acts beyond heterosexual penile-vaginal intercourse as against the order of nature, regardless of consent, and punishable by up to imprisonment for life.

Activists argue that Section 377 violates and infringes upon articles 14, 15, 19, and 21 of the Indian Constitution, which guarantee equality, freedom of expression and personal liberty, and dignity to all citizens.

The December 2013 ruling suggests that amending or repealing Section 377 is the responsibility of the Indian Parliament, not the courts. On January 28, 2014, the Indian Supreme Court dismissed a Review Petition filed by the nongovernmental organization (NGO) Naz Foundation and several others against its ruling on Section 377.

To read more the Naz Foundation and its activism surrounding Section 377, visit <http://www.nazindia.org>.

—Whitney K. Archer

either go untreated or turn to expensive private health care facilities.

LGBT individuals and *hijras* (transgender people) in India also face discrimination in India's health care system. Societal prejudices and unfair treatment cause many LGBT individuals to struggle with access to important health care services. Worries about harassment and physical and verbal abuse by health care workers prevent many LGBT members from seeking medical care. For *hijras*, societal stigma coupled with transphobia make accessing health care a traumatic experience because doctors remain insensitive and ignorant about transgender health issues. A 2014 study found that, in some cases, health care facilities asked transgender patients to visit at nonpeak hours (either early morning or late at night) to avoid interactions with other patients (Kar and Moulik 2014). In other cases, hospitals often had trouble identifying which ward (either the male or female) to admit *hijra* patients into, causing discomfort and embarrassment for *hijras*.

Maternal Health

About 56,000 women die during childbirth or from pregnancy-related issues every year in India, accounting for about 20 percent of maternal deaths around the world (UNICEF India 2014). Seventy percent of these deaths are completely preventable. The number of maternal deaths

per 100,000 live births was reduced significantly between 2007 and 2012. However, for every woman dying in childbirth, there are 20 women who continue to suffer the long-term illnesses that persist due to the lack of proper treatment (Gogoi and Motihar 2013). The primary causes of death include heavy bleeding or hemorrhage and seizures caused by high blood pressure, known as eclampsia.

Forty percent of all Indian women are underweight at the beginning of their pregnancy, and they only gain about 15 pounds during pregnancy (Huber 2015). For Dalit women, however, undernourishment is 8 percent higher (Borooah et al. 2012). Undernourishment is an important factor that affects the health of both mothers and babies and can lead to diseases or anemia. Anemia can be a debilitating and deadly condition, causing weakness, lack of energy, and loss of appetite, which can increase the risk of death during childbirth or giving birth to an underweight baby. Women from rural communities or poorer families are most at risk of suffering from undernourishment and anemia, as most do not receive any prenatal care.

Pregnancy and fertility are viewed positively in India, and the family plays a significant role in providing care during pregnancy and childbirth. Almost two-thirds of all deliveries take place in the home, whether by choice or consequence. The percentage of women in villages who turn to home birth is much higher than those in urban

areas, which is largely due to a lack of access to professional health care facilities in rural communities. Fewer than 50 percent of births in India are supervised by health care professionals; the use of traditional birth assistants, midwives, or *dais* for home births is still very common (UNICEF 2016). Many attendants in rural areas, however, lack the proper skills and training regarding safe and sanitary birthing practices. Births that take place at home in unhygienic conditions can have severe negative consequences for both mother and child.

Culturally, the postpartum period in India is given a lot of importance as a time for mothers to recuperate and form a bond with their newborn child. Some Hindu communities in the country still practice postdelivery “confinement” of new mothers, which consists of rest and engaging in limited or no housework while family members provide help with child care.

Diseases and Disorders

India has the third-largest HIV/AIDS epidemic in the world, and this has direct consequences for women’s health. About 2.4 million Indians are affected by HIV infections, accounting for about 0.3 percent of the total adult population (World Bank 2012). Of all HIV infections, 39 percent are among women, pointing to the social inequalities caused by cultural and social values that reinforce these inequalities. Seven out of ten women infected with HIV are from poor or rural communities (Ninan 2003). The highest rates of infection are found among women with high-risk behaviors, such as sex workers, both because of unprotected sex and intravenous drug usage. HIV infections are also increasing among the general population. A 2006 report suggests that infections among women in marriages with husbands involved with multiple sex partners has also increased in recent years, particularly in rural areas (Pradhan and Sundar 2006).

Women are especially vulnerable in the HIV/AIDS epidemic due to patriarchy and their status in society. Lack of power in the social hierarchy causes most women to frequently tolerate abuse, violence, and infidelity from their husbands, as the burden of blame for such behavior falls on women. Due to societal expectations, women also lack the choice to use a condom or to even have sex. Additionally, lack of awareness and access to information on HIV/AIDS result in most women failing to take control over their sexual health and in negotiating safer sex practices with their husbands.

HIV/AIDS disproportionately affects Dalit women and girls forced to become *devadasis* (literally meaning “servant of god”) who are sexually exploited. Their lower status coupled with the stigma of HIV makes them less likely to be able to access health care than non-Dalit women. *Hijras* (transgender people) are also at a higher risk of HIV transmission.

Tuberculosis (TB) is another major disease that an estimated 2.2 million Indians are affected by (Cowling et al. 2014). More women than men suffer from TB, and this greatly affects women’s maternal health.

Employment

Despite increasing educational levels, the International Labour Organization (ILO) ranks India 120th out of 131 countries in female labor participation (ILO 2013). In 2008, there were 388.6 million men and 361.5 million women in the working-age population (ILO 2011). However, from this population, only 129 million women were economically active as compared to 328.6 million men, amounting to a labor participation rate of only 35.7 percent for women and 84.6 percent for men. India’s labor force participation for women decreased to 29 percent in 2009–2010, compared to 37 percent in 2004–2005 (ILO 2013). This number dropped further in 2013 to only 27 percent for female workforce participation, ranking lowest among the BRICS (Brazil, Russia, India, China, and South Africa) countries (van Klaveren et al. 2010).

In 2006, the rate of unemployment for girls in India aged 15–19 years was 21 percent, and for young women aged 20–29, it was 17 percent, with 8.21 million unemployed females between the ages of 14 and 29 (van Klaveren et al. 2010). For rural women with higher educational levels, the unemployment rate is particularly high due to finding employment that is appropriate for their qualifications.

Typical Jobs and Careers

Where working conditions are good, urban women in India have had relative success in professional sectors. There are female heads in some of the leading public and private banks in the country as well as increasing female participation in the aviation sector. Of India’s 5,100 pilots, 11.7 percent are women (Moore and Pande 2015). However, most women who have gained regular employment still maintain stereotypical occupations, such as farmers, nurses, primary school teachers, or domestic workers in

private households as maids. Domestic work for maids is largely informal, does not provide any social security benefits, and offers poor wages. For rural women, the agricultural sector remains the primary field of employment. The percentage of men in agriculture has decreased significantly with more women taking up these roles. Rural women have also been gainfully employed in the manufacturing sector and in hotels and restaurants, while urban women are primarily employed in the finance and business sectors. In 2011–2012, 62.8 percent of women were employed in the agricultural sector, 20 percent were employed in the industry sector, and 17 percent in the services sector (Rustagi 2010).

Issues Related to Employment

The primary struggle for both rural and urban women searching for employment is traditional gender expectations and cultural attitudes toward women in the workplace. For rural women in India, families do not allow female members to leave their villages for training or job placements, making it difficult to access higher employment opportunities. For urban women, where education and income levels are higher, a survey of 1,000 working women in the capital of New Delhi showed that only 18–34 percent of married women continue working after having children (Arya 2015). With limited maternity support as well as lack of child care facilities for working mothers, women often quit their jobs to take care of their children.

The growing gender pay gap also affects women's participation in the labor force, as the differences between women's and men's wages have increased in recent years. The Annual Survey of Industries (ASI) notes that, in 2004–2005, the average wage for a man in regular employment was 212.30 rupees (USD\$4.60), whereas for female workers the average wage was only 91 rupees (USD\$1.96)—a gender pay gap of 57 percent (van Klaveren et al. 2010). Other issues that deter women from employment include gender inequality in the workplace as well as the general lack of safety for women in public places.

Family Life

Marriage and Sexuality

About 43.6 percent of India's roughly 500 million women are married, and 54.4 percent have never married. About 1.8 percent of women are widowed, and 0.2 percent are divorced or separated. The mean age at marriage is 23 years

old for females. In the age group 15–49 years, 81.4 percent of women are married, which is largely due to the lower age of marriage for women in many parts of the country (Office of the Registrar General & Census Commissioner, India 2001a).

Overwhelmingly, Indians have more arranged marriages than love marriages, accounting for about 90 percent of marriages in India, and 65 percent of Indians prefer that their parents have the final decision of who their spouse will be (Udas 2012). Arranged marriages constitute a marital union in which the families of a girl and boy fix the match based on various criteria, including status, values, and religious beliefs. Arranged marriages are separate from forced marriages; the former refers to a more collaborative effort with the bride or groom, whereas the latter constitutes a union that is arranged by the parents without the consent of the bride or groom. Forced marriages of women and girls largely take place in rural communities. The National Crime Bureau of India estimates that more than 20,000 housewives in India kill themselves every year, often due to forced marriages (Biswas 2016).

Love marriages are slowly becoming acceptable in India, especially in large cities, as more young Indians are choosing their spouses. In some cases, however, love marriages can lead to honor killings—the killing of a female family member who is thought to have brought dishonor to the family—particularly in the case of intercaste or interreligious marriages. Intercaste marriages are still considered taboo, and only 5 percent of Indian marriages are intercaste (Shrinivasan 2014). Women are usually the victims in honor killings because women are culturally believed to hold the honor of a family.

Cohabitation is becoming socially and culturally acceptable, particularly as the Supreme Court of India has recognized live-in relationships for many years. This ruling is only permissible for heterosexual couples and does not apply to same-sex or transgender couples.

Sexuality is rarely mentioned within families, though discussions surrounding sex and sexuality have gradually increased in modern times through what many call the “sexual revolution.” The 2014 book *India in Love: Marriage and Sexuality in the 21st Century* discusses how millions of young Indians are breaking age-old barriers and attitudes toward sexuality and marriage in recent years (Trivedi 2014). Women are particularly taking control over their own choices due to increases in women's education and economic freedoms, and they are shaping the trajectory of their love lives, disregarding social norms, and making

their own sexual decisions. In urban areas, women are leading the sexual revolution as the increased intermingling between members of the opposite sex in schools and colleges allow young women to explore their sexuality. For previous generations, marriage was the primary goal of college-aged women, but in recent decades, women have been looking for independence in both their careers and their love and sex lives.

Divorce and Widowhood

Divorce in India can be a traumatic experience for women, as a significant amount of social stigma surrounds the concept. The divorce rate in India is estimated at 13 in every 1,000 marriages, which is relatively low compared to other parts of the world, though there are no official statistics from the Government of India (Mitra 2015). However, divorce cases in family courts across the country have increased in recent years. The Special Marriage Act was passed in 1954, allowing all Indians to marry and divorce regardless of religion. Depending on one's faith, however, there are various marital laws that govern each community, including the Hindu Marriage Act, the Dissolution of Muslim Marriages Act 1939, the Muslim Women (Protection of Rights on Divorce) Act 1986, and the Foreign Marriage Act 1986.

In Hinduism, marriage is a sacred relationship and the most important part of a Hindu's life. Hindu marriages in India under the Hindu Marriage Act allow women to petition for divorce under the condition that the husband marries again during his first marriage or if the husband is guilty of crimes such as sodomy or rape. Due to gender inequality, the dissolution of a marriage in India disproportionately affects women as compared to men. In some cases, because of stigma surrounding divorce, women who have children have to face allegations that their children are illegitimate due to the absence of a father (Jha 2014). Divorced women struggle to maintain the costs of divorce, which are extremely high, and oftentimes they fail to receive their fair share of property.

Under Islamic law, as established in the Koran, a woman has the right to divorce from her husband, known as *khula*. There are specific procedures to follow to carry out a divorce in Islam, and the process is spread out over 90 days, which allows for reconciliation and reflection by both parties involved. In India, however, Muslim men use Muslim Personal Law and carry out divorces in a matter of minutes through what is being called "instant divorce," where

men say the words "*talaq, talaq, talaq*," or "I divorce you," three times in Arabic. The practice of instant divorce is banned in most countries, except India, where it is legally permitted. Muslim women in India have been opposed to this practice, criticizing it as un-Islamic and against the correct method as mentioned in the Koran and calling for a ban against it. A report by the Mumbai-based organization Bharatiya Muslim Mahila Andolan states that most cases of women who divorced because of this practice were from poor families. Their husbands did not pay the maintenance fees after separation, forcing them to return to their parental homes (BBC 2016).

Approximately 40 million women in India are widowed, which accounts for about 10 percent of all women in the country (Kannan 2013). As the status of women in India is seen through the family as the wife of her husband, a widow faces severe discrimination, is treated with contempt by family members, and is accused of being the cause of her husband's death. Widows become social pariahs and are denied from attending cultural and family events. Historically, Hindu women who were widowed were forced to self-immolate or commit suicide in an act called *sati*. Today, such practices have become obsolete, though widows are still expected to mourn their husbands until the end of their lives by only wearing white saris and no jewelry, and in more conservative Hindu traditions, by shaving their heads. Most widows struggle to survive without any financial security or welfare infrastructure. About 15,000 widows live in Vrindavan, known as the "city of the widows," where some nongovernmental organizations (NGOs) function to provide basic services such as food and health care (Barrera and Corbacho 2012).

Inheritance Rights

The Hindu Succession (Amendment) Act 2005 ensures that all daughters enjoy the same rights as sons and can inherit their parents' land and property. Under Muslim Personal Law, Muslim women in India are also ensured full property rights to inheritance. A 2010 study by the World Bank found that, as a result of the Hindu Amendment Law, women's likelihood of inheriting land increased by 22 percent since the inception of the law (Deininger et al. 2010). However, the practice on the ground still rarely reflects this rule in most cases. A 2013 report found that while women are central to the agricultural sector in India—80 percent of rural women work in the fields—they are still at a disadvantage and rarely inherit land and property from their

parents (Fletschner and Sircar 2014). The study notes that barriers to inheritance include continuing male bias in the law despite the amendments and social and cultural barriers, such as the preference of sons over daughters.

Politics

Women's Rights

Women's rights in India are secured and upheld under various statutes in the constitution. In 2013, the World Economic Forum (WEF) ranked India 101st out of 135 countries, up from 113th in 2011, in terms of progress based on economic, educational, health-based, and political indicators (WEF 2013). By 2015, India's ranking decreased to 108th. The state of women's rights in India has seen a decline in recent years because of various challenges, such as discrimination, lack of education, cultural stigmas, and violence, which have been a barrier to social advancement.

Although the caste system is now outlawed in India, the historical effects of it still linger in society. Scheduled Castes, locally known as Dalits, or "untouchables" (the lowest caste), are at a significant disadvantage compared to the rest of the population. Seen as the lowest class of people in the country, Dalits face oppression, dehumanization, and violence. Because of their sex and class, Dalit women in particular have been affected badly, and they remain at the lowest position in the social hierarchy, facing "double discrimination." Dalit women are almost forgotten in policies geared toward women in the country. They

are discriminated against in government programs geared toward health, education, legal rights, and employment. They have been the victims of violence and rape across the country, with almost no access to demanding their rights in society.

Women's Political Participation

In 2012, India ranked 100th out of 135 countries for its representation of women in Parliament and 100th for its representation of women in ministerial positions (WEF 2012). The female-to-male ratio for women in Parliament is 0.12. In recent years, Indian women's participation in politics has been a steadily growing phenomenon, with women's involvement taking place both within political parties as well as active involvement in voting, public demonstrations, and campaigning. In 2014, there was higher voter turnout among female voters than male voters in 16 of 35 states and union territories, with 65.63 percent of women voting in the parliamentary general elections as compared to 67.09 percent of men (PIB 2014).

In 2009, the 15th Lok Sabha (lower house) elections increased the number of female members of Parliament to 59, a record for women since independence, increasing political participation to 10.9 percent (Narayan 2009). The three largest political parties—the Indian National Congress (INC), the Bharatiya Janata Party (BJP), and the Communist Party of India (CPI)—all have women's wings, including the INC's All India Mahila Congress, the BJP's Mahila Morcha, and the CPI's National Federation of Indian Women.

Women's Voices

Gita Sahgal

Gita Sahgal, born in Mumbai, India, is a founder of a number of social justice organizations: Centre for Secular Space, Women against Fundamentalism, Southall Black Sisters, and Awazz, an organization against injustice and violence in the name of religion and politics in South Asia. Raised Hindu, Sahgal is a self-described atheist. Sahgal has championed democracy, secularism, human rights, and social justice in her work as a writer, filmmaker, and women's rights activist. Formerly head of the Gender Unit at Amnesty International, Sahgal was suspended after publicly accusing Amnesty International of "ideological bankruptcy," misogyny, and maintaining an affiliation with Moazzam Begg, a former inmate at Guantánamo Bay and alleged defender of the Taliban.

—Vanessa Vanderzee

Townsend, Mark. 2010. "Gita Sahgal's Dispute with Amnesty International Puts Human Rights Group in the Dock." *The Guardian*, April 25. Retrieved from <http://www.theguardian.com/world/2010/apr/25/gita-sahgal-amnesty-international>.

At the local government level, and in the *panchayat* (a five-person elected village council at the rural level), women are more active participants and leaders in their communities, working vigorously for women's rights and for political reforms in health, education, and financial resources. Women in local government roles are often more competent representatives than their male counterparts in terms of decision making and engaging community members for better outcomes in their constituencies, despite having lower education levels and less work experience.

Activist and Feminist Movements

India's feminist movement took off in the early 1900s, protesting British colonial rule in the fight for independence. The movement evolved more in the 1970s with a new wave of feminism and the goal of establishing and ensuring equal rights for all women in India irrespective of class, caste, religion, or culture. In their pursuit for equality, members of the movement have fought against culture-specific issues plaguing India's patriarchal society, such as regressive inheritance laws and the practice of *sati* (a widow who throws herself onto her husband's funeral pyre).

One of the country's most prominent women's organizations is the All India Women's Conference (AIWC), which was founded in 1927 "to function as an organization dedicated to the upliftment and betterment of women and children" (All India Women's Conference 2011). At an international level, AIWC holds a strong presence as a "premiere organization" for women's development and empowerment.

At a grassroots level, women's movements in India are particularly active and have seen much success in recent years. In the 1980s and 1990s, several autonomous women's groups were formed in various major cities and rural communities to address such issues as violence against women, rape, sexual harassment, rights of working-class women, and women's health and reproductive rights. One such group, the Forum against Rape, now called the Forum against Oppression of Women, has used legal and nonlegal methods to resolve domestic violence issues and bring attention to rape cases. They have held public protests and demonstrations, national campaigns, and provided counseling services.

Other prominent feminist organizations in India include the All India Progressive Women's Association and the All India Democratic Women's Association. The All India Dalit Mahila Adhikar Manch is an organization specifically for women of the Dalit community that fights against oppression based on caste and gender hierarchies.

LGBT Rights

India's Supreme Court ruled on Section 377 of the Indian Penal Code, criminalizing all "carnal intercourse against the order of nature," including consensual sex between adults of the same sex (Harris 2013). As a result, a deep stigma of homosexuality has led to violence and harassment against members of the LGBT community. Same-sex marriage is not legally recognized in India. However, there has been a significant push for recognition by LGBT activists and supporters to repeal Section 377. One case that

Women's Voices

Sampat Pal Devi

Sampat Pal Devi (1960–) is a social activist from Uttar Pradesh, North India. A poor woman of humble origins, she educated herself and then attended school to grade four with the support of her uncle. In a region of North India characterized by patriarchy, rigid caste divisions, female illiteracy, domestic violence, child labor, child marriages, and dowry demands, she founded the Gulabi Gang. The women in the Gulabi Gang wear pink saris and carry India's traditional weapon of self-defense, a lathi or bamboo stick. They fight for the rights of society's weakest and advocate for girls' education, women's literacy, and equal socioeconomic, cultural, and political opportunities. They prevail upon male offenders to see reason and, if necessary, seek public shaming for the unrepentant.

Koovagam Transgender Fest

Koovagam is a village in the Vilappuram district of Tamil Nadu, India, known for its annual festival of transgender and transvestite individuals, which lasts 15 days in the Tamil month of Chitirai (April/May). During this festival, transgender people from all over India assemble to take part in the auspicious occasion. The celebrations are marked by many cultural programs and ritualistic performances. It takes place at the Koothandavar Temple dedicated to Aravan. Here, transgender people marry the Lord Koothandavar, thus reenacting an ancient myth of Lord Vishnu/Krishna, who married Koothandavar after taking the form of a woman called Mohini. This took place in a one-night-long married relationship, because Koothandavar had to sacrifice himself the next day during the war. Following the myth, transgender people who attend the festival mourn the god Koothandavar's death through ritualistic dances and by breaking their bangles the next day.

The festival has significant cultural and social importance, considering the marginalization the transgender (*hijras*, as they are commonly called in India) people face within the mainstream social realms in India. It is a reiteration of the fact that Hindu tradition and mythology was rooted in transgender individuals' existence, which mainstream society chooses to ignore. The festival is followed by an annual beauty pageant and several other competitions and seminars that focus on improving the plight of transgender people in the country.

—Reshma Koroth

won legal recognition for same-sex marriage was in 2011 and involved two women under the Punjab and Haryana High Court in Gurgaon, India. The court granted the two women approval to marry in India's first lesbian marriage (Nelson 2011).

Hijras, as they are locally known, have a long history in South Asian culture and includes eunuchs, intersex people, and transgender people. *Hijras* are recognized under law as the "third gender." Officially, this means that the government has developed quotas for government jobs and educational institutions—rights granted under the Rights

Women's Voices

Laxmi Narayan Tripathi

Laxmi Narayan Tripathi (1979–) is a transgender activist, Hindi television actress, and Bharatanatyam dancer. As a member of India's *hijra* (transgender community), Laxmi has founded and runs Astitva, an organization for the support and development of sexual minorities. Despite the risks of ostracism, Laxmi has chosen to be identified as a *hijra* and has written about her life in her autobiography, *Me Hijra Me Laxmi*. She was the first transgender person to represent the Asia Pacific region in the United Nations in 2008. She has advocated for victims of HIV/AIDS and represented India in 2006 at the World AIDS Conference in Toronto. She fought for recognition of a third gender in India, which was granted by India's Supreme Court in 2014.

of Transgender Persons Bill 2014. However, discrimination against *hijras* is still rampant in society, and harassment and rape in public spaces force many *hijras* to quit their jobs or drop out of school. Employment opportunities for *hijras* are limited, thus economically marginalizing them, and many resort to begging, prostitution, or working as street entertainers. *Hijras* are also unable to attain driving licenses or to receive various social benefits for programs and opportunities led by the government.

Religious and Cultural Roles

Indian culture is incredibly rich and unique, and it is often seen as an amalgamation of various cultures and religions. "Unity in diversity" is often applied to explain the harmony

between the multiple cultures that make up a country with a vibrant history that is several thousand years old. The culture of India has been heavily influenced by Dharmic religions, namely, Hinduism and Buddhism, with a strong Islamic impact from the Mughal Empire.

From ancient times, women in India are said to represent a source of strength and love, embodying the values of Dharma (righteousness) and Kama (love, care). In most parts of Indian culture, women's values are in the traditional roles of wife, mother, or daughter. In modern times, these roles are shifting, and what was originally believed to be well defined and fixed is evolving to allow women to enter various spheres of life. Traditionally, women hold a central role in Hinduism and play a subservient role to men. Women are seen to be dependent on men, and they are praised as essential to the household to facilitate procreation and continuation of the family lineage. The role of a wife has traditionally been portrayed as one of selflessness, self-denial, and sacrifice, which for a long time was synonymous with arranged marriages. Today, Indian women are demanding a more egalitarian partnership and the freedom to choose their own spouse. While the family remains the bedrock of Indian society, Indian women are nonetheless changing the social order outside of the home.

In terms of Hindu priesthood, women in India are challenging the age-old tradition that only men can become priests. In the city of Pune, institutions have opened that formally provide training for women from all Hindu castes to conduct rituals and prayers for such events as marriage and last rites, (Phalnikar 2010). Though there is much opposition from orthodox Hindus, women are continuing to defy tradition and undergo intense training, including learning Sanskrit and memorizing all the verses from ancient texts needed to conduct prayers.

The advent of Islam in India brought with it such practices as *purdah*, which is a form of cloth that conceals women's bodies from unknown men as a sign of modesty. A variation of this also exists for many Hindu women in rural India, where a fold of the sari is drawn over the face in the presence of men.

Portrayal of Women in the Media

The media and the entertainment industry in India, popularly known as Bollywood, are a central part of everyday life for all levels of Indian society. Television serials and daily soap operas specifically target housewives because more women than men watch daily soaps. Indian soap operas

are notorious for portraying women in one of two stereotypical characters: women are either the scheming “vamp,” constantly plotting and planning a conspiracy against others, or the “ideal woman” (Joshi and Kumari 2015). The ideal woman character tends to be a reflection of Indian society's expectation of the traditional woman—a submissive woman who busies herself with household chores and whose goal is simply to serve her family and sacrifice her own happiness for that of everyone else. Such dramatizations tend to have a significant sociocultural influence on society. A few television drama series have attempted to address various issues affecting women in Indian society such as child marriage, widow remarriage, and women's education. However, such topics are still considered taboo issues and are an exception in the broader entertainment industry.

In the advertisement and commercial industry, depictions of women fall within the same stereotypical role of women as wife: cooking, serving food, and washing clothes. Also, the oversexualization of women in commercials has increased in recent years in an effort to attract viewers and promote sales of products.

Issues

Sexual Assault and Rape

Sexual violence and rape in India has been on the rise in the last decade. The 2013 National Crime Records Bureau (NCRB) report by the Government of India ranks rape as the fourth most common crime against women in the country, which includes sexual harassment, marital rape, and gang rape. Other forms of violence persist, such as domestic violence and acid throwing. Sexual violence against women has increased from 9.2 percent in 2009 to 11.2 percent in 2013, with 70 percent of reported crimes taking place in India's largest cities (NCRB 2013). Violence in rural communities generally remains unreported. Human Rights Watch (HRW) states that the Indian government has failed to provide adequate protection for women and children from sexual violence (HRW 2014).

The most prominent case that shook India was the December 2012 gang rape and subsequent death of a 23-year-old woman on a public bus in the capital city of New Delhi. The woman was so severely tortured by six men that her intestines were damaged. The case drew international attention, and national protests called for legal reforms and institutional changes to protect the human rights of women in the country. Widespread demonstrations led the

Indian government to take action and set up reforms to its criminal laws as well as the passing of a new law, the Criminal Law (Amendment) Act 2013, by the Lok Sabha (lower house) in March 2013. Critics argue that the government has failed to fulfill its promises in providing safeguards to prevent such crimes (HRW 2014). Because of this case, there has been much public discussion and awareness of sexual violence against women in India, and more women are increasingly reporting rape cases. In 2013, reports of rape and sexual violence increased 35 percent from the previous year, rising an additional 8 percent in 2014 (NCRB 2013).

Trafficking and Prostitution

The U.S. Department of State places India in the Tier 2 level for countries that have failed to comply and meet the minimum standards for combating human trafficking (U.S. Department of State 2015). India is notorious for being a major source and hub for trafficking in Asia because of its geographic location, which includes both domestic trafficking as well as being a “transit country” to other parts of the world. Ninety percent of India’s trafficking in persons is domestic, with more than 2.5 million prostitutes in 300,000 brothels across the country (U.S. Department of State 2015). Twenty percent of India’s sex workers and prostitutes are children under the age of 16 due to the growing demand for young girls by customers (Hameed et al. 2010). The largest red-light district in India, Sonagachi, is located in Kolkata, in West Bengal. It houses about 14,000 prostitutes, most of whom have been trafficked into forced prostitution.

The sexual exploitation of women and children in India is done through sex tourism, child sex tourism, pedophilia, and prostitution at religious pilgrimage sites and tourist destinations. In many cases, women and children get lured from their homes in rural villages with the promise of work and other forms of employment. With India’s diverse geographic and linguistic landscape, victims find it almost impossible to return home after being taken thousands of miles away from their villages. Once trafficked, victims are sold to people who force them into prostitution and forced marriages, as housemaids without pay, or, in some cases, to work as bonded labor in industries such as agriculture.

Women and young girls forced into prostitution lead a life of constant sexual and physical abuse, which often goes unreported and unpunished. Socioeconomic factors such as gender inequality and discrimination, family violence,

and lack of access to education coupled with issues of government corruption allow trafficking to persist and illegal brothels to thrive in Indian society.

Domestic Labor: Housemaids

Often viewed as outcasts, domestic workers are one of the most marginalized and excluded groups in Indian society. Despite increasing literacy rates in the country, almost 43 percent of working-age women are employed in domestic work (Mander 2015). Domestic labor includes women who work in private households as maids, servants, cleaners, cooks, or caregivers. Women, adolescent girls, and children as young as seven are all employed in domestic work; culturally, women and girls are seen as more submissive and well-versed in household chores. For many families, particularly from rural and poor communities, it is culturally acceptable for a woman to be engaged in domestic work, which is sometimes considered her only employment opportunity.

In India, middle-class and lower-middle-class households outsource domestic work, allowing women in these households to climb the career ranks. However, the domestic workers remain within the constraints of household work as maids due to their lack of education and formal skills. The working conditions are poor, with little to no benefits, holidays, maternity leave, social protection, or regulation of work, leading to working hours that range from 8 to 18 hours every day, for both live-in and non-live-in maids. Although some states have a minimum wage for domestic workers, the average wage is at the poverty line and barely covers basic expenses such as food.

A major issue related to domestic labor is the discrimination, abuse, and violence female domestic workers face on a daily basis because of religion, caste, gender, and ethnicity. Housemaids from lower caste families are seen as “dirty” and “impure” by their employers, making it difficult for them to perform household chores easily. Verbal, sexual, and physical abuse against domestic workers is common and includes rape, beatings, and pinches at the hands of employers.

Beauty Standards

Socially constructed Indian beauty ideals have long been a topic of debate and controversy. India’s obsession with lighter-skinned complexions over darker ones is pervasive throughout the social makeup of the country, in entertainment, the commercial industry, and within the family

and community. Historically, skin color played a critical role in determining which class or caste one belonged to. Darker complexions were generally associated with the lower castes, and fairer skin was associated with higher caste and intelligence. Those in positions of power, including the British during colonial rule, and the Mughals, all were fair-skinned, which reinforced the idea that fairer skin meant power and privilege. Today, these beauty ideals still exist in India, particularly based on geographic region. Due to harsher sun rays in the southern part of India, South Indian women tend to have darker skin than their North Indian counterparts. Darker skin is often seen as “undesirable” or “untouchable,” with stereotypes persisting in society of South Indian women being less beautiful than North Indian women purely based on skin color (Iyer 2015).

Part of this obsession with skin color persists in the commercial industry; beauty skin-bleaching creams and products are a thriving market in India, worth about USD\$432 million (Thacker 2015). The most popular is Fair & Lovely, a skin-lightening cream that was introduced in India in 1975. Commercials heavily market the cream by showing Bollywood celebrities and superstars as brand ambassadors, perpetuating the notion that fair skin is most beautiful and best associated with success.

Celebrities in the Bollywood movie industry are notorious for skin lightening, as female lead roles are often given to fairer-skinned actresses. In 2013, Bollywood actress Nandita Das spearheaded the “Dark Is Beautiful” awareness campaign to highlight the diversity of skin tones and celebrate “beauty beyond color” (Women of Worth 2013).

Indonesia

Overview of Country

Indonesia is a unique country made up of a grouping of 17,508 islands (6,000 are inhabited) that shares borders with Papua New Guinea and Malaysia and sits as a neighbor to Australia and Singapore. As of July 2016, Indonesia was considered the world's third most populous

democracy (in July 2015, the population was estimated at 255,993,674); largest archipelagic (group of islands) state; and largest Muslim-majority (87.2%) nation (CIA 2015).

Indonesia covers a total landscape of about 735,000 square miles (1,904,569 sq. km)—699,000 square miles of land and 35,000 square miles of water. As a tropical environment that straddles the equator, the country faces the extreme natural threats of floods, drought, tsunamis, forest fires, and earthquakes; however, its greatest threat is from volcanoes. Indonesia contains 76 historically active volcanoes—the largest number in the world. Indonesia is second only to the Amazon for the density of its forests, which often feed the annual forest fires.

Indonesia's history began in the early 17th century, when the Dutch began its colonization upon discovering this group of islands that shared cultural similarities among their populations. The name *Indonesia*, meaning "Indian Islands," came from Englishman J. R. Logan when he visited Malaysia in 1850. In 1928, nationalists adopted "Indonesia" as the name of their hoped-for nation.

After falling under Japanese occupation from 1942 to 1945, a deadly period of fighting, negotiations, and revolution occurred until the first elections took place in 1999. Indonesia continues to struggle with maintaining a unified government in its 31 provinces. In 2005, the country entered a peace agreement with separatists from the Aceh Province, allowing for its first democratic elections; however, the Free Papua Movement in the Papua Province continues to meet the Indonesian government with armed resistance (CIA 2015). While Bahasa Indonesian is the official language, more than 700 languages are spoken in Indonesia.

The Indonesian government today is considered a democracy, though unrest continues throughout the archipelago. According to USAID, "Indonesia constitutes the world's third largest democracy and fourth most populous nation, with the largest economy in Southeast Asia and some of the world's most diverse natural resources" (USAID 2010).

The status of women in Indonesia is generally considered high, though their position and rights vary considerably in different ethnic groups. Men are identified as community leaders, decision makers, and mediators with the outside world, while women are considered to be the backbone of the home and family. The country's rich, cultural heritage can be seen in its music, theater, dance, and architecture, all of which express the varied ethnic and religious influences within the country.

Issues facing the country include poverty, education, human rights, infectious disease, and governmental corruption. Indonesia is one of five countries that together are home to more than half of the world's poor. Because the constitution does not include protections against discrimination, distinct challenges face populations of difference, including race, sexual orientation and gender identity, religion, and HIV-positive status.

In 2014, the UN Development Programme ranked Indonesia 110th out of 188 nations based on the Gender Inequality Index (GII, 0.494). The country is almost evenly divided between males and females in all age brackets.

Girls and Teens

According to the *Daily Mail*, human trafficking and sex tourism have long been big business in this vast archipelago of 240 million—thanks to corruption, weak law enforcement, and a lack of reporting largely due to family embarrassment or little faith in the system. The International Labor Organization (ILO) estimates 40,000–to 70,000 children become victims of sexual exploitation in Indonesia annually (Thomas 2013).

It is believed that the primary cause leading to child prostitution is drug addiction, but there is another addiction just as strong—the status of possessions. In a country whose majority population exists at or below poverty, the sex trade provides funding for teens to have possessions that give them status and prestige in the eyes of their peers.

The Indonesian government has established services for women and girls in its 34 provinces that focus on assisting victims of violence; however, the level of support depends on the location (larger urban center versus smaller district), and most rural districts have no center. Urban centers are likely to have “women’s desks” or specialized private crisis intake rooms that are staffed by women officers. These services are set up to receive reports from female and child victims of sexual assault and trafficking. Some also provide temporary shelter.

According to the National Commission on Violence against Women, more than half of Indonesian girls under the age of 11 have experienced some form of female genital cutting (FGC), 79 percent of these occurring before the age of 6 months. These acts are often carried out by midwives and birth attendants. In 2010, the Ministry of Health issued “safe practices” for female cutting, lifting the ban that had been posed on the practice, and in 2014, the Ministry of Health established a health advisory group

to oversee the debate on the practice. The advisory group includes the religious leaders who were integral in having the ban lifted in 2010.

Province governments with no authority to implement laws based on sharia (Islamic religious guidelines) still enforce laws mandating female modesty and the expectation of Islamic dress for all women who have reached puberty and beyond. While both male and female Indonesian teens have become known for rebellion against Islamic teaching and practice, in 2015, a curfew was passed that only applied to female teens (Danaparamita 2015).

Though the situation for girls and teens is challenging, signs of positive change can be seen in both the increased freedoms through artistic expression and growing access to higher education. Women artists such as Emiria, Murni, and Sri Astari Rasjid depict gender conflict, abuse recovery, and women’s strength in their works. Dance is used in artistic, religious, and political forums to express the struggle by and hope for girls and women in Indonesia. Institutions of higher education, such as the Institut Seni Indonesia Yogyakarta, have established international partnerships that encourage girls to attend university while embracing their culture and, more importantly, to study abroad at partner universities where they can be exposed to other cultures and opportunities.

Education

In 2015, more than 90 percent of Indonesians were considered literate, completing an average of 13 years of education. Women make up 63 percent of the population that is considered illiterate. However, according to a 2016 study, Indonesia ranks low for “literate behavior characteristics” (the availability and use of libraries and newspapers, general schooling levels and access to computers)” (Noszlopy 2016).

Indonesians are considered “e-literate,” a growing trend in which reading occurs in electronic format and is more centered around social media and communication than reading at home or reading for pleasure. Indonesia ranks as one of the world’s top Facebook- and Twitter-using countries (Thomas 2013). Some of this shift is based on world trends; however, much of it is also centered on access to print literature. Because of the archipelagic nature of Indonesia, transportation costs for acquiring print materials are often prohibitive in keeping books on the shelves; bookstores are trending toward selling nonbook items to stay afloat.

A National Book Committee has been established to tackle the challenge of a literate country with very few active readers. Some of their goals are to produce literature (supporting and funding translations and publications); to develop literature (supporting the industry through workshops and events); and to promote literature (supporting participation at book fairs and literacy festivals). In addition, the School Literacy Movement (Ministerial Regulation No. 23/2015) promotes nontextbook reading 15 minutes daily before classes begin and is working to provide e-books that will combine the new generation's technology obsession with the country's goal of encouraging reading as both an educational and recreational activity (Noszlopy 2016).

Though considered a literate country with a high rate of high school graduates, Indonesia still ranks low in standard testing that denotes job readiness. According to Elizabeth Pisani in her 2013 *Inside Indonesia* article, "Three-quarters of those Indonesians who are still in school at age 15 don't have the basic math skills that they need to function in society. Two-thirds don't have enough science to get by effectively in the modern world, and one in five can't read well enough to perform basic tasks in the workplace." She goes on to say that the Indonesian education system does nothing to incentivize teaching, only to graduate students. The result is a country of literate citizens who may struggle to improve their own situations or that of the country (Pisani 2013).

While only a small number of universities and colleges that are state-run (and therefore meet national standards of excellence), it is notable that access to higher education has increased significantly in recent years. "The number of young people in higher education grew by 60 percent between 1999 and 2010, to over 4.3 million" (Pisani 2013).

Health

Access to Health Care

The World Health Organization's (WHO) minimum health care workers per 10,000 people is 23. Indonesia has 25 per 10,000, mostly in its urban communities. Only 65 percent of Indonesia's hospitals are accredited, and the bed space is far below the needs of its citizens.

In 2013, just more than 3 percent of the gross domestic product (GDP) was spent on health care. In 2014, the Indonesian government made the bold move to establish universal health coverage through a program called *Jam-inan Kesehatan Nasional* (JKN). The goal of the USD\$1.6

billion investment is to have complete health coverage for all Indonesians by 2019.

With roughly 65 percent of Indonesians, approximately 86 million, falling at or below the poverty level, the success of this program could change the health of the entire country. However, WHO questioned the program's capacity when it estimated a cost of USD\$13 billion to USD\$16 billion annually to provide effective health care for the country's poor, far more than the government's planned USD\$1.6 billion investment.

To offset the unexpected cost of the new system, Indonesians now pay nominal premiums, ranging from USD\$1.70 to USD\$4.10 a month for broad medical coverage. However, this small fee does not come close to bridging the gap between their payment and the cost of their health care. Many of the patients taking advantage of the system are those who have serious medical conditions that have been ignored until now because they could not afford treatment. That means that the cost of their care is far above the anticipated "maintenance" care for which the program was budgeted. In year two of the program, the government was already paying USD\$224 million in health care costs above the premium payments made by its citizens.

Now more than 150 million people are enrolled in the health insurance program, and it will be mandatory by 2019. Academic studies by the Gadjah Mada University Centre for Health and the Paramadina Graduate School of Diplomacy, however, report that it will be impossible for all Indonesian citizens to access health insurance by 2019 (Razavi 2015). In the absence of its success, uninsured Indonesians depend upon nongovernmental organizations (NGOs) to provide basic health and emergency care.

While the government pays 19,225 Indonesian rupiah (USD\$1.60) per month for treatment in a third-class hospital ward for each poor citizen, individuals can also purchase one of three insurance options: 25,500 rupiah (USD\$2) per month for third-class treatment; 42,500 rupiah (USD\$3.60) for second-class treatment; and 59,000 rupiah (USD\$5) for first-class treatment.

The Health Ministry says Indonesia needs more than 12,000 new doctors to meet its goal of 40 per 100,000 people. The country has 88,000 doctors, and its universities produce 7,000 doctors annually (Rachman 2015).

Maternal Health

In 2015, the maternal mortality rate was 126 deaths per 100,000 live births, and the infant mortality rate was 24

deaths per 1,000 births (CIA 2015). USAID estimates that more than 80,000 newborns die annually, a rate that has not declined in the 21st century. According to WHO, approximately 69 percent of births are delivered by midwives. This may negatively affect the maternal and infant mortality rates because of a lack of training for midwives, a lack of access to emergency obstetric care in instances of problem births, and the limited availability of neonatal and maternal medications.

Another factor is the young age of first-time mothers. In 2014, a challenge was filed to the standing Marriage Law that allowed 16 years old as the minimum age for marriage, noting that the infant and maternal mortality rates are in direct correlation to the youth of the mothers. The court rejected the claim. It would be another year before the minimum age was raised to 18.

Finally, women's lack of control over their own bodies also plays a role. Often, when a woman is advised to seek specialized care, the husband will override the doctor's advice based on tradition, finances, or pressure from family. "Inequality in decision-making, limited access to health services in rural areas and lack of information on healthy pregnancy are among the factors that contribute to maternal deaths," said Masruchah, the secretary-general of the National Commission on Violence against Women. "There's a view that husbands should have final say over domestic matters, but men often don't know what their wives feel" (IRIN News 2010).

Diseases and Disorders

An estimated 660,300 Indonesian adults were living with HIV/AIDS in 2014, and USAID estimates an additional 30,000 are infected as of 2016. An estimated 33,700 people have died, ranking Indonesia 14th in the world in those infected with the disease and 8th in deaths from HIV/AIDS.

Tuberculosis (TB) affects over 1 million new Indonesians annually, and over 100,000 people die from TB each year. By 2030, the number of people with diabetes in Indonesia is projected to top 11.8 million, a higher percentage than the country's population growth.

The incidence of infectious disease in Indonesia is considered very high, particularly in food-, water-, and airborne diseases such as bacterial diarrhea, hepatitis A, typhoid fever, dengue fever, and malaria. Malaria during pregnancy is directly correlated to infant mortality. More than one-third of Indonesia's population is believed to

be at risk for lymphatic filariasis (elephantitis). Intestinal worms are endemic in the country.

Much of the infectious disease is brought about by low access to clean water. Because of extreme poverty in Indonesia, many households cannot afford the water installation fee for clean water to their homes. A number of social service organizations name clean water as a major initiative for their work in Indonesia.

In addition, one health care provider noted,

Indonesia is undergoing a transition in disease epidemiology, marked by the still high prevalence of communicable diseases, and yet at the same time degenerative and non-communicable diseases such as cardiovascular diseases and cancer are on the increase. The rate of mortality from non-communicable diseases rose from 41.7 percent in 1995 to 59.5 percent in 2007—an increase of 42 percent—the latest figure available from the Health Ministry. According to the Health Ministry's Basic Health Survey, the prevalence of diabetes was 2.1 percent in 2013, compared to 1.1 percent in 2007. Hypertension was prevalent among 31.7 percent of the population, up from 25.8 percent in 2007. (Rachman 2015)

Employment

Fifty-one percent of Indonesian women are engaged in the workforce (Adzhani 2015), and women own 35 percent of the small and medium-sized businesses in the country (Asia Foundation 2012). However, many of these businesses are still registered in the name of the husband because the women have limited access to financial institutions for support in business development. According to a study conducted by the Asia Foundation in 2012, Indonesian women are active in many aspects of public life, but "most professional areas continue to be dominated by men." In addition, "gender stereotyping and traditional views of women's roles continue to disadvantage girls and women in Indonesia, making it difficult for women to be full and equal participants in social, economic, and political life" (Asia Foundation 2012).

According to WageIndicator.Org, in 2008, women's employment was highest in households (76%), health and social work (57%), restaurants and hotels (56%), and education (55%). Forty percent of women employed worked in agriculture, followed by wholesale and retail (22%) (WageIndicator.Org 2010). Women in business find further

complications due to the 1974 Marriage Law. Because the man is still considered the head of the household and the expected breadwinner, married women who work outside the home are taxed at a higher rate than working husbands, who receive preferential tax treatment.

Discrimination and abuse against women in the workplace is best exemplified in the police and military forces. Female recruits are subjected to a “virginity test” to determine whether they are morally capable of serving. According to the *Washington Post*, “In Indonesia, the test is considered standard practice. Women seeking to join the military are required to strip naked and have their genitalia manually examined by a doctor, purportedly to ensure that they are virgins” (Ayuandini 2015).

NPR reported that when confronted by Human Rights Watch (HRW), General Moeldoko, the head of Indonesia’s armed forces, responded, “So what’s the problem? It’s a good thing, so why criticize it?” He “conceded, though, that there was no direct link between a woman being a virgin and her abilities as a member of the armed forces, but insisted that virginity was a gauge of a woman’s morality—one of the three key traits he said a woman must have to serve in the [Indonesia Armed Forces], along with high academic aptitude and physical strength” (Neuman 2015). Men are not subjected to the same tests to measure their aptitude for service.

There is a generational shift for women occurring in Indonesia. Ariane Utomo reported in *Inside Indonesia* that 70 percent of the 25–29 age group reported in 2010 that work was their primary activity, and for every 100 educated women in this group, there were only 76 men, a shift from a predominantly male-educated society (the 50–54 age group reported 176 educated men for every 100 women) (Utomo 2015).

While this speaks to a positive shift in the role of women, women still earn less than men in the same jobs (the pay gap is one of the largest in East Asia), still carry gender-identified roles in relationships, and still see the family role as more important than the work one. Additionally, this generation still sees it as the male’s role to be the major breadwinner and the woman’s role to keep the home, even if both are working professionals.

Indonesian law mandates that businesses give three months’ paid maternity leave to female workers, though family leave does not extend to fathers. At least half of the maternity leave must be taken after the birth. A pregnant woman may not be forced to work between 11:00 p.m. and 7:00 a.m., if she can provide a doctor’s certificate stating

that this would endanger her health (AngloInfo Indonesia 2016).

Like women in much of the world, working women in Indonesia “face a double-burden in society. They can work but are also perceived to have the main responsibility of caring for the family at home,” said Miranda Fajerman, an equal-opportunities adviser in Indonesia with the ILO. “Research shows that women tend to find it more difficult to enter the labor force after giving birth to children. They are less likely to be hired in the labor industry because they are seen as vulnerable” (Jakarta Globe 2013).

However, as research and time support the positive impact of women in the Indonesian workforce, it is expected that women’s professional rights will also improve. Yulia Immajati, a World Bank consultant on gender, noted, “Hiring a woman may be more expensive in the short term, but in the long term investing in a female employee is worth it.” The World Bank’s economic performance report on Indonesia backs up that statement, showing that increased gender equality in the Indonesian workforce has correlated to a reduction in poverty.

Family Life

An Indonesian’s identity is drawn from her family and her position in it. The eldest male, even if he is younger than the eldest female, is considered the head of the household, or *bapak*. From birth, infants are carried by the mother and have a close relationship with their father, though that relationship grows weaker as children age. The extended family plays an integral role in children’s development, often housing older children from a household with a larger number of family members.

The role of these “aunties” and “uncles” is highly respected, though the parents, even if the child is living away from them, are still given the highest respect. Besides providing additional housing, the communal living of Indonesian families creates food and shelter security in a country with high poverty and provides lifelong support for older generations. It is an expectation that the younger generations will care for the older generations.

Most property in Indonesian families is considered “community property,” particularly in these communal families. Decisions in the home are made by the collective; thus, individuals rarely express individualized thinking within the family structure. Directness is frowned upon, and Indonesians rarely say “no,” which, in family

structure, can lead to women having little or no voice in the household.

Marriage is highly prescriptive and governed by the long-standing religious impact on marriage policy established in the Marriage Law of 1974. It is still considered “illegal” for couples to “intermarry,” defined as marrying someone from a different religious community (HRW 2016).

Divorce is available to both men and women, though it is more difficult for women if it is being sought through religious courts versus government courts. Many divorcees receive no alimony, as there is no system to enforce payments. If there is no prenuptial agreement, joint property is divided equally. The law requires a divorced woman to wait 40 days before remarrying; a man may remarry immediately. In many courts, the judge’s role is to mediate the marriage conflict and avoid divorce, as divorce is still considered taboo and marriage is held in highest regard (Arijaya 2011).

The 1974 Marriage Law, which governs marriage and divorce, established the legal age of marriage as 16 for women and 19 for men. In June 2015, the Ministry of Defense increased the legal age of marriage for women to 18, calling out that age as the passage from being defined as a child to an adult. While the 1974 Marriage Law provides equal status under family, labor, property, and nationality laws, it does not provide equal status in regard to inheritance rights for widows. Male family members have more rights to inheritance than the wife of the deceased.

Politics

On August 17, 1945, women were granted the right to vote. Anyone 17 years old or older can now vote in Indonesia, and while the voice of women is growing stronger each year, women are still a small majority in the decision making for Indonesian governance and human rights.

While Indonesian political policies are not governed by religious teachings, religion does play a powerful role in Indonesian society and governance. Islam, Christianity, Catholicism, Hinduism, Buddhism, and Confucianism are all represented in Indonesia and are the “accepted” religions, though atheism is not an option. While Indonesian politics will claim secularism, in reality, regional politics are governed, for the most part, by the majority religion in that region. Despite the presence of a multiplicity of religions in Indonesia, Muslim faith dominates, and it is expected that governmental leadership will follow

Muslim faith and policy. As a result, Muslim expectations for women are often carried out through governmental expectations, including dress code, participation in government leadership, and the role in the family and family possessions (Indonesia Investments 2016).

An Overview of the Indonesian Political System

Indonesia’s political system consists of three branches. The executive branch consists of the president, the vice president, and the cabinet. Both the president and vice president are chosen during presidential elections as a joint election. They serve for a term of five years that can be extended once by another term of five years when reelected by the people. After election, the new president appoints the cabinet.

The legislative branch is the People’s Consultative Assembly (Majelis Permusyawaratan Rakyat (MPR)). It is empowered to set or change the constitution and appoints (or impeaches) the president. The MPR is made up of the People’s Representative Council (Dewan Perwakilan Rakyat (DPR)) and the Regional Representative Council (Dewan Perwakilan Daerah (DPD)), which creates laws, produces the annual budget in cooperation with the president, and conducts political affairs. The members are elected for five-year terms.

Unfortunately, the DPR is known for its corruption and scandals. The highest court in Indonesia’s judiciary system is the independent Supreme Court (Mahkamah Agung). It is the final court of appeal and also deals with disputes between lower courts. It, too, is known for its corruption and unethical decision making.

For women and girls, protections in Indonesia are often impacted by interpretation of the laws. Rape is defined as “penetration of sexual organs” and is only recognized as a crime if corroborated by a witness. According to the Bureau of Democracy, Human Rights and Labor, most offenders are given the lightest possible sentence when found guilty.

In instances of marital rape and domestic violence, cases remain poorly documented and significantly underreported. While use of contraception in the country averages 62–70 percent, it is more prevalent among married women because of the difficulty for unmarried women to acquire contraceptives (Index Mundi 2016). Domestic violence was reported as the most common form of violence against women, recording more than 293,000 incidences in 2014.

According to UN Women, “In Indonesia, the challenges to gender equality remain discriminatory attitudes, which prevent women from exercising their economic rights, property ownership and land inheritance, access to credit, wages and workplace benefits, and livelihood opportunities. Exploitation of women migrants, violence and harmful traditional practices are further cause for concern.” The report goes on to claim, “A ‘national vision’ on women’s empowerment has brought the realization of gender equality to state and community level, focusing on the improvement of women’s quality of life, raising public awareness about gender equality and justice, eliminating violence against women, promotion and protection of women’s human rights, and strengthening the capacity of women’s organizations” (UN Women 2016).

The Presidency of Indonesia

Indonesia’s sitting president in 2016, Joko Widodo, made political commitments in his first year of presidency in 2014, but many of those commitments remain unfulfilled. As of this writing, the status of his human rights reforms, according to HRW’s *World Report 2016* (which covers 2015), shows some forward movement in rhetoric but a need for action beyond the rhetoric.

No changes in laws impacting the protection of religious minorities have been implemented, and 100 Indonesians imprisoned for peaceful advocacy for their religious rights remain captive. A declaration lifting foreign media restrictions was made; but no policy was put in place, and no consequences for refusal to follow policy were laid out. Governmental and religious leaders continue to deny access to foreign media.

In August 2015, a Reconciliation Commission was announced. No further details were provided, and no commission members have been named. The death penalty is still regularly enforced, even in cases where mental health issues would find a defendant incompetent for trial.

In the environmental protections arena, fines and sentences were imposed on plantation owners using fire to clear palm forests, sending a message of zero tolerance for the risk to human life posed by impure air from these fires. (HRW 2016)

Women and Politics

To increase gender equality in politics, Indonesia has imposed a mandatory quota of 30 percent female parliamentary candidates in each electoral district or else it will

be disqualified. While the idea behind the rule is good, in reality, the political parties often choose women who have little chance of defeating the male candidates of choice and who have no political experience that would benefit women should they win the election. Many of the candidates have come from the entertainment industry or have been spouses of male candidates in other political arenas.

Women now comprise 18 percent of the 560 elected members of the Indonesian House of Representatives, and in some regions, women’s representation has reached as high as 34 percent (Asia Foundation 2012).

Despite the challenges to the quota, though, since Indonesia adopted it in 2004, the number of women elected to the 560-seat House of Representatives increased from 11 percent to more than 18 percent in 2009 (Kwok 2014). The vice president, Megawati Sukarnoputri, a woman, was a candidate for president, though her reputation comes mostly from her presidential father, Sukarno. She was opposed by many Muslim leaders because of her gender, but she had the largest popular following in the national legislative election of 1999.

This shows that the influence of women in politics in Indonesia is increasing, but there are still many barriers that affect women’s voices. While there are growing numbers of NGOs and feminist groups, a lack of coordination leads to a compromised voice for women because there is little shared focus. Because the media is still predominantly controlled by the government, the feminist voice is largely silent.

Politics are considered to be a man’s world, and women are discouraged by the patriarchy from entering parliament and the political arena. Because each party has a limited number of seats, the tendency is to focus on male candidates to fill those seats, rather than risk a female candidate for a coveted seat. Candidates are still chosen by the few, most of whom are men, and the only commitment to women is to hit the “30 percent rule,” in which 30 percent of political candidates are expected to be women.

Elections require funding, which most women do not have, as only a small percentage are participants in the workforce. Additionally, women are still expected to be the grounding force in the home and are discouraged from seeking work or leadership outside the home (Parawansa 2014).

Women and the Politics of Land

Throughout Indonesia, women’s rights to land and marital property are insecure and unregistered. Some of this

is due to the status of women, and some is due to the high cost of registering land that forces landowners (men) to list only themselves. It is common practice for male sons in the family to inherit land over the wife. In general, Indonesia's property policies do not support the sustainability of land and natural resources or the ability for women to maintain land under the family name in the absence of the patriarch. Currently, only one-third of land title certificates list women as owners (Brown 2003).

While the National Land Agency (BPN) has been resistant to reforms that support a more expansive interpretation of landownership, NGOs, feminist organizations, and other human rights movements recognize that land tenure and natural resource property issues must be considered in legislative reforms to move Indonesia forward in a global conversation around agrarian, legal aid, and natural resource initiatives (USAID 2010). As women enter universities and the workforce in historically significant numbers, it will be imperative that they be at the table for these conversations.

These issues are complicated by the fact that Indonesians continue to make allowances for personal status of ethnic and religious groups, enabling these groups to live in accordance with traditional laws and customs with regard to marriage, divorce, and inheritance. This allowance denies basic human rights principles of equality and nondiscrimination and denies these women their rights of property and status within the community (Westendorp 2015).

Religious and Cultural Roles

It is still considered taboo for a woman to be a religious leader in Indonesia. Despite considering itself a "secular" country, religious conservatism plays a significant and influential role in the governance of Indonesia. According to the National Commission on Violence against Women, Indonesia has 365 local laws that are discriminatory toward women and are based on religious doctrine, including utilizing "prostitution" laws to punish women who are caught walking alone at night without a husband. The Ministry of Home Affairs established a 2014 law that allows for banishment of these discriminatory laws, but the commission has yet to utilize their authority to protect the rights of women in Indonesia (Adzhani 2015).

Some scholars argue that Islam was built on egalitarianism and that modern Islam has lost its way due to men's interpretations of the teachings of Mohammad to

maintain male dominance in society, religion, and the home (Rohman 2013).

A growing movement among Muslim women in Indonesia is the commitment to piety by attending prayer meetings, religious gatherings, and study groups. These women, who also often engage in pilgrimages and specialized spiritual "trainings," believe that they can directly impact social issues (corruption, crime, sex trafficking, drugs) by strengthening society through their spiritual knowledge and commitment. Additionally, they view their spiritual piety as their contribution to the home, as the male of the home is the core provider and unable to focus full attention on matters of religion and piety (Blackburn 2011).

In a July 28, 2016, report by the SETARA Institute for Democracy and Peace, the first signs of an economic turnaround were reported. President Joko led the passage of the Tax Amnesty Bill, which is expected to boost tax revenue and encourage tax evaders to declare their offshore assets and repatriate these into the country. Riding this wave of progress, the president removed nine ineffective ministers from his cabinet and demoted two others. In replacing them, he focused on filling the positions with qualified economists and corporate leaders, including Dr. Sri Mulyani Indrawati, the managing director of the World Bank and a leading woman in past cabinet work (SETARA 2016).

For religious freedoms, the change is slower coming. Religious intolerance has been on the rise with an estimated increase of 50 percent in 2015. The SETARA Institute documented 197 cases and 236 incidents of violence in Indonesia during that year. This organization rests the responsibility for the rise in religious violence on the shoulders of the government: "Instead of fulfilling its constitutional duty to protect the rights of its people to practice their religious beliefs freely and without discrimination, the government is actually the main actor in perpetuating religious intolerance throughout the country." The report calls out the lack of policy and the failure to enforce policies that are in place.

Feminist Response

Moderate Islam followers interpret the role of women in Muslim structure as being compatible. It is believed that "Indonesian Islam" is a unique version of Islam that makes room for a form of feminism that is not recognized in traditional Islamic culture. Muhammadiyah, the modernist

Islam organization, divides Islam followers with Nahdlatul Islam, the more traditionalist model.

Muhammadiyah Islam tends to be followed by educated urban Indonesians, whereas Nahdlatul Islamic followers are more likely found in the Javanese countryside. The women's groups of both Indonesian Islamist groups measure in the millions and have been instrumental in pulling the two factions philosophically closer together. The result has been the emergence of feminism in Indonesian Islamic followers and the opening of conversations around gender relations (Blackburn 2011).

"Indonesian feminism" identifies the unique form of feminism in Indonesia that is inclusive of religion, gender, and community. It supports the promotion of women's rights but also advocates for the liberation of both women and men, calling out that men's viewpoints are a result of their own submission to the patriarchal and religiously influenced system in which they operate. Indonesian feminism has created a movement that focuses on gender issues versus equal rights. Conversations by feminist advocates speak to gender equality in a way that incorporates all Indonesians, regardless of gender identity.

Two women emerged from these movements and have been instrumental in the feminist agenda in Indonesia: Lies Marcoes-Natsir and Farha Ciciek Asegaf. Marcoes-Natsir "was instrumental in founding the Fahmina Institute, a non-profit in Cirebon, Indonesia, that works to establish an equal society based on justice, humanity, Islamic tradition and local cultural wisdom" (Berkley Center 2013). As a medical anthropologist, Marcoes-Natsir focuses her research and advocacy on the intersection between gender equity and Islamic culture.

Farha Ciciek Asegaf is considered an instrument of peace. In her work with Rahima, a center for information and training on women's rights issues, she developed an innovative and accepted way of advocating through *sala-wat* (prayers sung in praise of the Prophet Mohammad). Popular culture has grasped onto her teaching and is expanding the discussion of women's rights through religious study groups, high school classes, wedding celebrations, cultural festivals, and singing competitions (N Peace Network 2015).

These two leaders in the feminist movement continue to work in the education system to reform discriminatory teachings and misogynistic behaviors. Joined by Siti Musdah Mulia, the first woman appointed as a research professor for the Indonesian Institute of Sciences, these women work alongside other Indonesian feminists, both men and

women, to bring reform to the Islamic code and create gender equality.

Issues

For women and girls, protective reform is on the decline. HRW's *World Report 2016* on Indonesia reports that "as of October, national and local governments had passed 31 new discriminatory regulations in 2015, leaving Indonesia with 322 discriminatory local regulations targeting women" (HRW 2016). One example of these regulations is the July 2015 passage of a law that allows male personnel to take a second wife (polygamy) if their current wife is unable to bear children. Female personnel are not allowed to participate in polygamy.

Indonesia does not participate in the Refugee Convention or have any law that addresses asylum. Current practice allows temporary asylum with the expectation that refugees will move on to another country for permanent residency. In 2015, over 13,000 refugees (including over 450 minors) were living in temporary asylum in Indonesia (HRW 2016).

Advocacy for Women's Rights

NGOs have a rich history—particularly in the areas of religion, family planning, education, rural health, and women's rights—though they manage limited funds and government restraint. Foreign support for NGOs led to tensions between the various governments and the cancellation of aid if the support was viewed as politically motivated. But with the collapse of the New Order regime in the 1990s, NGOs have become more active in serving various constituencies, even with limited resources (Countries and Their Cultures 2016).

UNIFEM lists 17 advocacy groups working for women's rights and against violence against women in Indonesia. These include the following:

1. Indonesian Women's Association for Justice—providing gender training to law enforcement
2. Women's Journal Foundation—raising awareness through the media
3. Anti-Violence against Indonesian Women's Movement—creating service networks
4. Indonesian Women's Congress—teaching women self-defense
5. National Commission on Violence against Women—addressing national policy reform

6. Mitra Perempuan (Elimination of Violence against Women Foundation)—providing domestic violence research and programming
7. Indonesian Women's Coalition for Justice—raising political awareness on issues of violence against women
8. KALYANAMITRA—raising community awareness to encourage foster families in the absence of women's crisis centers
9. Women's Solidarity for Human Rights—focusing on violence against women migrant workers
10. Rifka Annisa—providing extended crisis services (counseling, education) to women in poverty
11. Women's Association against Violence—raising community awareness of violence against women through public forums
12. Centre for Analysis and Dissemination of Data—providing a gender perspective to data
13. Flower Aceh—using economic empowerment to prevent violence against women

In addition to the work of these Indonesia-based groups, the International Women's Alliance, Gabriela, and other international organizations maintain a focus on the rights of women in Indonesia and provide support and advocacy for them through international efforts.

Lesbian, Gay, Bisexual, and Transgender Communities

In a 2006 Pew Research Center survey, "Global Divide on Homosexuality," 93 percent of Indonesians claimed that gay people should not be an accepted part of their community (Jakarta Globe 2006). This is a shift in thinking for a country that has traditionally been a safe haven for members of the LGBT community. According to the *Wall Street Journal*,

The LGBT movement [in Indonesia] emerged in the late 1960s, according to a report by USAID and the United

Nations Development Program, and in 1982 gay men started Lambda Indonesia. In 2013 the country hosted a national dialogue to discuss the situation facing sexual minorities that was attended by officials, activists, international organizations and dozens of LGBT groups, of which there are now close to 200 across the country, estimate activists. (Schonhardt 2016)

For the LGBT community in Indonesia, particularly in the Aceh province, human rights violations have been documented in both the establishment and enforcement of laws influenced by sharia, Muslim religious beliefs. These laws, which impose public dress requirements (the hijab or veil and long skirts for women) and criminalize same-sex relationships, have been extended beyond the Muslim community. A 2013 study by LGBT advocacy group Arus Pelangi found that nearly 80 percent of LGBT individuals reported experiencing psychological violence, and 46 percent reported physical violence because of their identity (Schonhardt 2016).

On September 27, 2014, the Aceh province parliament criminalized both same-sex sexual acts and sexual relations outside of marriage with a punishment of up to 100 lashes and 100 months in prison (HRW 2016). And as of this writing, the Indonesian 1974 Marriage Law only allows for men to be the head of household, no matter the situation.

While same-sex relations are not governmentally illegal in Indonesia, pressure from the growing Islamic following coupled with recent antigay rhetoric from key political leaders has led to extreme antigay activity throughout the country, and local regulations across the country criminalize same-sex sexual activity. In South Sumatra, same-sex sexual activity is treated as prostitution, and in Jakarta, a transgender person found out at night is assumed to be a sex worker and arrested under the pornography and prostitution law.

In early 2016, when universities began offering counseling to members of the LGBT community, an outcry began that the youth of Indonesia were being "corrupted." Defense Minister Ryamizard Ryacudu described it as "an attempt for Western nations to undermine the country's sovereignty," and former communications minister Tifatul Sembiring called out to his million-plus followers on Twitter "to kill any gay people that they find" (BBC 2016).

Indonesia's vice president, Jusuf Kalla, was quoted as saying, "What is most worrying is that [the LGBT community] want to fight for equal marriage rights," as he called

for a cut in funding for a UN program that provided support and education for LGBT issues.

All of this is in extreme contrast to the country's traditional acceptance of gender difference. The Bugis tribe in Sulawesi has long recognized five genders, including *bissu*, a person who is neither a man nor a woman. In 2008, an Islamic school was established for transgender women to learn more about their Islamic faith and to pray together in a safe space. It was shut down amid the recent anti-LGBT campaign, following the Indonesian Psychiatric Association's call to "promote, prevent, cure and rehabilitate LGBT people." Families of LGBT minors often force them into therapy, confine them to their homes, or force them to marry against their will.

NGO reports show abuse of transgender people by local authorities with little investigation done when LGBT community members file a complaint against police. Societal abuses of the LGBT community are not only tolerated, but encouraged. Indonesia's top Muslim clerical body declared a fatwa (law) on "Lesbians, Gays, Sodomy, and Molestation" in December 2014, calling for the death penalty for anyone participating in these "acts" and for legislation to "[prevent] the legalization of the existence of the homosexual community" (HRW 2016).

Because the Aceh local government has established a sharia criminal code against "homosexual acts," sharia police are now surveilling the province to arrest those they consider engaging in these acts. On September 28, 2014, the sharia police arrested two women they considered lesbians and forced them into a rehabilitation shelter. The code allows for a penalty of 100 strokes with a cane if a person is found guilty of homosexual acts.

Despite the presence of an antidiscrimination law, the government enforces little to no action to prevent discrimination against LGBT persons and considers the law to be apart from their protections. Attempts at marches and peaceful demonstrations by the LGBT community have been met with violence, which has often been encouraged by government and religious entities.

Those identifying as transgender or in the process of transitioning are only allowed to change their gender on their identity cards following proof of gender reassignment surgery under the 2013 Civil Administration Law revision. The only accepted proof of reassignment surgery is a court order that declares the reassignment process to be complete.

Advocacy groups for LGBT rights include SuaraKita, GLAAD, Melela, Arus Pelangi, HRW, and many others that

are operating outside of the country due to threats against LGBT advocates and the community. As mentioned earlier, in 2016, Indonesians have been called upon to abolish LGBT rights and to punish and kill members of the LGBT community.

There are many other organizations, associations, and groups focused on the rights of women, the LGBT community, and the safety of women and girls. The struggle for these groups remains safety in an environment where advocacy groups have not only been declared illegal but where citizens have been encouraged to silence advocates. International organizations are being called upon to bring outside pressure to Indonesian policy makers and President Joko for immediate protections for all Indonesians and sweeping policy reform that comes with consequences for failure to adhere to policy. President Joko continues to reiterate his commitment to human rights and governmental reform.

J

Japan

Overview of Country

Japan is an island country in East Asia. It borders the Pacific Ocean to the east, the Sea of Japan to the west, the East China Sea to the south, and the Russian Far East to the north. It consists of the main islands of Hokkaido, Honshu, Shikoku, Kyushu, and Okinawa and more than 6,800 smaller islands of varying sizes. The country's territory is roughly 108,000 square miles (380,000 sq. km). Located in a tectonically active zone, Japan is prone to earthquakes.

According to the *Statistical Handbook of Japan in 2015*, the total population in Japan in 2014 was 127.08 million, which ranked 10th in the world and accounted for 1.8 percent of the world's population (8). Japan's aging population is a concern of its society; in 2014, "the aged population (65 years and over) in Japan was 33 million, constituting 26.0 percent of the total population (i.e., one in every four persons) and marking a record high" (Statistics Bureau 2015, 13). In 2014, the UN Development Programme ranked Japan 26th out of 187 nations based on the Gender Inequality Index (0.133) (UNDP 2015).

Girls and Teens

Kawaii Culture

The Japanese word *kawaii* means "cute." Cuteness is adored by many Japanese girls and teens. The typical symbols of

the *kawaii* culture include Hello Kitty and Japanese school-girls' uniforms. Hello Kitty is the commercialization of *kawaii* culture; schoolgirls' uniforms that typically consist of a blouse with a sailor-style collar and a tiny miniskirt demonstrate how Japanese society portrays girls and how girls position themselves. Brian Ashcraft explains, "For girls in their mid-teens the uniform symbolizes a brief period in their life when they are free, unbound by adult matters like career, marriage, and children" (Ashcraft and Ueda 2014, 23).

Although *kawaii* is a method of self-expression among youngsters, Masako Itoh suggests, "When children are young, *kawaii* can be used for both boys and girls, but the word becomes restricted to females sometime in the early teens. After that, *kawaii* is a term applied as a compliment to females, especially teenage girls" (Itoh 2008, 129). Itoh goes on to argue, "Being cute is not a position of power or equality. One of the attractive things about cuteness, which others admire, is that the cute person is always subordinate in her attempt to please others" (129).

If the *kawaii* phenomenon has to be based on emphasizing girls' submissiveness and dependence, it expands the influence of patriarchy and degrades women's statuses. For instance, girls' school uniforms in adult videos inspire male fantasies about female purity and powerlessness on the one hand, and on the other hand, it turns girls into sex objects.

Teen Suicides

In his famous novel *Norwegian Wood*, Haruki Murakami starts his story with a teen's suicide, and he depicts several young women's suicides throughout the book. According to CNN, Japanese school students commit suicide more often on September 1 (the date on which the new school starts) each year than on any other date, according to figures collated by Japan's suicide prevention office over a period of more than 40 years (Wright 2015). Being bullied at school is a leading cause of younger students' suicides.

In Japan, children who have hardships in adapting to school are permitted to drop out of school and stay at home, but they can still graduate in due time. Amy Borovoy explains that these withdrawn young people are allowed to stay home from school under their mothers' care, away from all pressures and social opprobrium. These children are comforted and gradually encouraged to participate in society. However, during the time when they stay at home, it is quite common that there is no individualized diagnosis or treatment for them (566). This kind of family and community support may help reduce the risk of teen suicides, but in the end, it cannot fundamentally solve children's problems outside of the home.

Some of the young people in Japan today feel isolated and lost, in what Anne Allison describes as losing any sense of belonging and any faith in the future or in themselves. Such individuals are liable to commit suicide or other sudden, violent behavior. She emphasizes that the care deficit in Japan requires people and society to pay more attention (Allison 2011).

Education

School Education

Japan's primary and secondary education is based on a "six-three-three" system: six years in elementary school, three years in lower-secondary school, and three years in upper-secondary school. The period of compulsory schooling includes the nine years at elementary and lower-secondary schools. As of May 1, 2014, the data of Educational Institutions in Japan shows that the number of male students and the number of female students were similar in kindergarten, elementary school, lower-secondary schools, and upper-secondary school. A gender difference was demonstrated when students graduated from upper-secondary school. The ratios of male to female students was about 5:1 in colleges of technology, 1:7.5 in

Women's Voices

Setsuko Nakajima

My parents celebrated all the Japanese traditional holidays. One of the most memorable holidays is March 3, Girl's Day.

In the middle of February, my mother spent several hours placing our beautifully adorned Hina dolls on specially made steps. My sisters and I looked forward to this day because we could have sushi and sweets. We could also taste sweet sake a little. This was a big treat, just this once a year. In the early morning of the fourth, my mother hastily put the Hina dolls back in their boxes. It was said that daughters could not marry if the Hina dolls were on display a long time after the third.

Being a good wife was a proper way of life for women in those days. Single women over 25 years old were called "leftovers" or "a day-old Christmas cake."

When my sister got married, she took her Hina dolls with her. Despite my mother's loving efforts, I am single, and my Hina dolls are in my sister's house.

junior colleges, and 4:3 in universities (Statistics Bureau 2015, 169).

Activities

According to the "2011 Survey on Time Use and Leisure Activities" in the *Statistical Handbook of Japan in 2015*, to Japanese who are 10 years old and older, the participation rate for sports was 63 percent:

The most popular sport for both genders was "walking or light physical exercise" (men: 31.1 percent; women: 39.2 percent). Other popular sports for men were "bowling" (15.1 percent) and "golf (including golf practice range)" (13.7 percent). For women, such sports were "bowling" (10.6 percent) and "swimming" (9.7 percent). The participation rate for "learning, self-education, and training (excluding school and professional activities)" was 35.2 percent. Men preferred "computing, etc." (14.8 percent) and "foreign language" (11.0 percent), while women preferred "cooking, sewing, or home management, etc." (12.6 percent), as well as "arts and culture" (12.3 percent). (175)

Women's Traditional Gender Roles in Education

In the article “Challenges to Education for Girls and Women in Modern Japan: Past and Present,” Kimi Hara suggests that prior to the end of World War II women's education in Japan can “by and large, be characterized as gender segregated, gender stereotyped, inferior, and less valued compared to that of males” (93). Prior to World War II, the ideology of Japanese women's school education was “education for good wives and wise mothers,” which corresponds to the family ideal defined by Confucius and serves to maintain the Japanese patriarchal family system.

Confucius felt the family was the fundamental unit of society and strictly hierarchical. He also favored sons over daughters. This ideology was highly promoted by the Minister for Education Mori Arinori (1847–1889). In 1887, Mori Arinori made the ideology one of his educational reform policies. Although women's traditional gender roles as good wives and wise mothers have been challenged in contemporary Japan, women's education in Japan has still been influenced by their traditional gender roles. For instance, before the 1990s, the Ministry of Education made general home economics a required subject in upper-secondary schools for female students only. In 1994, upper-secondary schools began requiring both sexes to study home economics.

Despite women's much higher education level in the early 2000s, many Japanese parents, and even some faculty in schools, still expect female students to adopt women's traditional gender roles after they graduate from college. For many female students, future marriage and household duties are emphasized more than careers as part of their education. To have equal opportunities after graduation, female students should be encouraged to participate in society and be given more career choices.

Health

Japanese Diet

Japan is surrounded by water, and it is famous for a healthy and rich diet, which includes abundant seafood. Data from the Office for National Statistics in 2014 shows that with the benefit of raw fish, vegetables, and green tea, Japanese women live an average of 86.4 years, the highest life expectancy of females in the world. Crag Wilcox, a leading gerontologist, found that the Japanese diet is healthy. He stated, “Japanese people eat more tofu and more konbu seaweed than anyone else in the world, as well as squid

and octopus, which are rich in taurine—that could lower cholesterol and blood pressure” (Molloy 2014). However, Kenji Shibuya, a professor of global health policy at the University of Tokyo, pointed out, “Although Japanese food is widely praised throughout the world, traditional Japanese food is low in fat, but also high in sodium, and lacks nutrients from fruits, nuts, and whole grains. High blood pressure and smoking numbers continue to be high” (Shibuya 2013).

Health Care

According to the *Statistical Handbook of Japan in 2015*, “life expectancy at birth in Japan was 86.6 years for women and 80.2 years for men in 2013. Japan's life expectancy remains the highest in the world” (164). The long life expectancy of Japanese women is also attributed to Japan's health care system. The universal health insurance helps every Japanese citizen receive necessary medical treatment.

The leading cause of death in Japan is cancer. Based on the *Statistical Handbook of Japan in 2015*, “the death rate by malignant neoplasms has continued to increase, reaching 28.8 percent of all deaths in 2013” (165). Because of the competition-oriented social environment in Japan, suicide became the leading cause of death for people aged 15–39 in 2013. The number of suicides in Japan was 26,063 in 2013.

Mental Health

Since the 1990s, Japan has experienced a marked rise in psychological disorders and reported suicides. The data from the Ministry of Health, Labor, and Welfare from 1996 to 2008 shows that there were more women than men suffering from mental and behavioral disorders, mood disorders, and schizophrenia, schizotypal, and delusional disorders during those years (Vogel 2013, 163–164).

In 2016, mental disorders are a major issue in Japan. According to Yujiro Hara's research, a 2010 survey of businesses' mental health-related policies, “63.5 percent of businesses have had employees who were absent for one month or more for mental health reasons, and the figure grows to 97.5 percent for companies with 1,000 or more employees. These numbers rose since the previous survey in 2008” (Hara 2014, 5).

Within the Japanese cultural context, Vogel suggests that the longing for silent oneness with those one is close to and the wish to be understood without words (*sassuru* in Japanese) are very influential in Japanese society (Vogel 2013, 175). Yoko Kawanishi further relates *sassuru* culture

to the lack of communication skills in present-day Japan. She finds that shy individuals who are determined to preserve one's honor and are unskilled at developing relationships are inclined to spend all their time alone, indulging themselves in computers, computer games, or fantasies. Both Borovoy and Kawanishi suggest that the discouragement of showing one's individual self in Japanese culture impedes good mental health and healthy social relationships (139).

Employment

Japanese Women in the Workplace

Based on the *Statistical Handbook of Japan in 2015*, the 2014 labor force participation rate by gender was 70.4 percent for men (down 0.1%) and 49.2 percent for women (up 0.3%). In 2014, there were 36,210,000 men and 27,290,000 women employed in Japan. By industry, the percentage of female employment was high in "medical, health care and welfare"; "accommodations, eating and drinking services"; and "living-related and personal services and amusement services." By occupation, women were prominent among "service workers" and "clerical workers" (Statistics Bureau 2015, 123–129). In Japan, marriage and childbirth are still important factors that affect women's employment.

An M-shaped curve shown by the female labor force participation rate demonstrates "women leave the labor force when they get married or give birth and then rejoin the labor force after their child has grown and the burden of child-rearing is reduced. A comparison with the data from twenty years ago (1994) shows that, in 2014, the 35–39 age group replaced the 30–34 age group to form the bottom of the M-shaped curve" (Statistics Bureau 2015, 124).

Compared with other developed countries, Japanese women have a lower rate of participation in the workplace, especially after childbirth. According to the article "Holding Back Half the Nation" in *The Economist*, "Female participation in the labor force is 63%, far lower than in other rich countries. When women have their first child, 70% of them stop working for a decade or more, compared with just 30% in America. Quite a lot of those 70% are gone for good" (*The Economist* 2014).

Japanese Female Entrepreneurs

Women's economic status is a decisive factor of women's independence. Women's entrepreneurship is closely related to women's economic status and leadership in

society. According to the *Global Entrepreneurship Monitor (GEM) 2014 Women's Report*, the rate of Japanese women's Total Early-Stage Entrepreneurship Activity (TEA) was 2 percent, the lowest among the 83 economies examined. In Japan, women's chances to be entrepreneurs are less than one-fourth as likely as men. Japan is also one of the four innovation-driven economies in which the female youth TEA rates is the lowest, less than 1 percent among 18- to 24-year-olds (Kelley et al. 2015). Japanese women's low TEA rates cannot be understood as separate from Japanese conventional business culture, the collapse of the bubble economy in 1991 and the ensuing long recession, and Japan's patriarchal tradition.

However, the article "Japanese Women Entrepreneurs: Implications for Family Firms" sheds light on the exploration of Japanese women's entrepreneurship. It claims Japanese women's entrepreneurship can be attributed to six aspects: (1) the rise of women in the labor force, (2) women's working experience, (3) the opportunity to attain higher education, (4) industrial structure changing from heavy industries to service industries, (5) the growth of the Internet and information technology, and (6) the improvement of women's purchasing power (Welsh et al. 2014, 287–288). Based on the *Annual Report on Japanese Women Entrepreneurs*, researchers found that in 2010 30.2 percent of women entrepreneurs run service businesses, followed by direct sales at 18 percent, and 17.2 percent with food and travel businesses (Welsh et al. 2014, 287–288). The article points out that the reasons why women entrepreneurs develop their own businesses include self-accomplishment, creating an income, raising a family, and having a career. The authors conclude, "Japanese women entrepreneurs play an important role in economic growth, even though the number of women entrepreneurs is decreasing" (Welsh et al. 2014).

In addition, due to the aging population and dwindling workforce, women's leadership and their participation in the labor force are gaining more attention by the Japanese government. As part of his economic growth policy, Prime Minister Shinzo Abe aims to fill 30 percent of leadership positions in Japan with women by 2020, though it seems there is still a long way to go to reach this goal (Sekiguchi 2014).

Employment Culture for Women

According to the *Statistical Handbook of Japan in 2015*, by employment pattern, the ratio of nonregular staff members in

among all male employees was 21.8 percent, while the corresponding ratio for females was 56.7 percent, revealing a large gender difference (Statistics Bureau 2015, 130). The high percentage of female part-time workers demonstrates the gender gap in terms of employment and reflects the sexist employment culture in Japan. A sexist culture in the workplace can hardly provide an equal opportunity to women. In her article “What’s Holding Japanese Women Back,” Sylvia Ann Hewlett points out that although child care is an important factor that makes women decide to take a career break, the sexist business culture is the key factor that affects their career development. Highly educated Japanese women complain that they are pushed off the career track by unsupportive work environments and managers who do not value them. According to Hewlett, nearly two-thirds (63%) of highly educated Japanese women reported that they quit because their career was not satisfying, and a startling 49 percent left because they felt stymied and stalled (Hewlett 2013).

Another important factor that keeps Japanese women from the workplace is the influence of tradition and social recognition. The shadow of Japanese traditional women’s roles is still there. As one author points out, “If a woman is working, many feel it is because she has to, which reflects poorly on the husband’s ability to provide for his family” (Itoh 2008, 112). *The Economist* also indicates that being a professional housewife could be many women’s choice.

Women’s attitude about work also becomes more conservative:

In 1979, 70% of women agreed with the statement that “The husband should be the breadwinner and the wife should take care of the home.” By 2004 that had fallen to 41 percent. But in 2012, perhaps because of the recession in 2007–2009, just over half said they preferred to stay at home. A survey last year showed that a third of very young women want to become full-time housewives. Potential husbands, meanwhile, were less traditionalist: only one in five young men said he wanted his future wife to stay in the home. (*The Economist* 2014)

Child care also holds Japanese women back from regular employment. Despite the high level of many Japanese women’s education, compared with men, it is much harder for a married woman to land a regular full-time job in the workplace, not to mention a leadership position, because women’s maternity leave and heavy child care responsibilities are of concern to a lot of companies. Due to the

shortage of child care centers, many mothers have to wait for a long time to put their children in day care. Even if they find a spot for their children at day care, many of them may still distrust its service and choose to take care of the children on their own. Moreover, the expense of day care is not a small cost to a family. If the child cannot be picked up on time, the family has to pay a great deal for the overtime child care. According to *The Economist*, in Japan, husbands spend more time at work than their counterparts in other developed countries, but they spend less time on child care or household chores (2014). It is always the wife who is responsible for child care and household duties. Thus, it is very hard for a mother to take any job that requires overtime work. However, working overtime is a common practice for Japanese companies, which means many mothers must stay at home to fulfill household and child care responsibilities.

Family Life

Household Roles

As with China and Korea, Japan is influenced by Confucianism, which emphasizes male authority and female submissiveness in the family, especially prior to World War II. According to the *Interpretations of Comprehensive Meanings Discussed in the White Tiger Hall (Baihutong shuzheng)*, women’s three submissions are the following: before she gets married, she follows her father; after she marries, she follows her husband; after her husband dies, she follows her sons (Chen 1994). The Confucian family ideal establishes that women’s active space should mostly be in the home. The duties of a wife include rearing children, managing a household, and taking care of the elders and children.

According to Susan Vogel, who has conducted research on Japanese women, families, and mental health issues, the ideal of being “good wives and wise mothers” actually came from “the values of the middle class from the gender roles of the samurai classes in pre-Meiji Japan” (4). Vogel states, “The Japanese professional housewife was a well-defined role, idealized since the 1880s as the epitome of the ‘good wife and wise mother’” (3). In contemporary Japan, the nuclear family has gradually replaced the multi-generational family. Education provides women with more options after they graduate. Instead of being full-time homemakers, more women choose to develop their own careers, marry later, and have fewer children. Some women choose not to marry.

In her book *The Japanese Family in Transition*, Vogel finds that from 1970 to 2005, multigenerational households decreased from 16.1 percent of households to 6.9 percent; one-person households increased from 20.3 percent to 29.5 percent; and nuclear households held relatively steady between 56 percent and 61 percent. Arranged marriages (*omiai*) dwindled, and most disappeared by the end of the century. More women found jobs outside the home and married later or not at all. Many refused to marry men whose mothers lived with them. And they were having fewer or no children. The average age of marriage for women has increased; it was 23 in 1950, 25.9 in 1990, 27 in 2000, and 28.8 in 2010. Meanwhile, the fertility rate dropped; it was 3.65 children in 1950, 1.54 in 1990, 1.36 in 2000, and a low of 1.26 in 2005 (150–151).

Lesbian, Gay, Bisexual, Transgender (LGBT) Experiences

According to an online survey conducted by international public relations and advertising giant Dentsu in 2015, 1 in 13 Japanese people (7.7%) between the ages of 20 and 59 identify as lesbian, gay, bisexual, or transgender (LGBT). In the 2012 Dentsu survey, 1 in 19 respondents identified as LGBT. The growth of the number reflects that more LGBT Japanese are coming out of closet (Thompson 2015).

The Pew Research Center conducted a survey in 39 countries involving 37,653 respondents in 2013. The survey found that the rate of Japanese society's acceptance of LGBT people was 54 percent, which ranked Japan 15th out of 39 countries surveyed (Pew Research Center 2013). Same-sex marriage is unrecognized in Japan. A nationwide poll conducted by Nihon Yoro Chosa-kai on behalf of Kyodo News in 2014 shows that 52.4 percent of Japanese adults opposed marriage rights for gay couples. Japan does not have protections for LGBT people from discrimination in employment and housing. Transgender people can legally change their gender after undergoing sex-reassignment surgery. There are no laws regulating or addressing same-sex adoption in Japan (Equaldex 2016).

Boys' Love manga are comics about romance and sex between teenage boys or young adult men. This genre is written by female writers and read mainly by female readers. In her article, "Gender Bending and Exoticism in Japanese Girls' Comics," Rebecca Sutter summarizes two contradictory explanations about female authors' depiction of male same-sex relationships: (1) portraying relationships between equal partners and regarding the representation of same-sex romances as a model for

heterosexual ones that value parity, compatibility, and true love; or (2) expressing frustration and futile attempts to escape the norms of patriarchal society (549–550). Different from the two explanations, Sutter argues that the gender bending and exoticism in the genre of Boys' Love manga is a reflection of exoticization of Christianity on the visual and thematic levels. The exoticization of Christianity constitutes a similar inversion of Orientalism. (Sutter 2013, 552–556).

Marriage and Fertility

The annual number of marriages in Japan has been declining in recent years, based on the data of the *Statistical Handbook of Japan in 2015*: "In 2011, 662,000 couples married, marking the first time this number fell below 700,000 couples. In 2013, 661,000 couples married, and the marriage rate was 5.3" (18). In the meantime, the mean age of first marriage continues to climb up: "The mean age of first marriage was 30.9 for men and 29.3 for women in 2013, a rise by 2.4 years and 3.1 years, respectively, over the past twenty years" (Statistics Bureau 2015, 19). The declining marriage rate and rising marrying age in the early 2000s explains why the birth rate in Japan drops. Divorces have increased "since the late 1960s, hitting a peak of 290,000 couples in 2002. Subsequently, both the number of divorces and the divorce rate have been declining since 2003. In 2013, the number of divorces totaled 231,000 couples, and the divorce rate (per 1,000 population) was 1.84" (Statistics Bureau 2015, 19).

The birth rate in Japan has declined since 1970s, according to the *Statistical Handbook of Japan in 2015*: "The decline in the live birth rate may partly be attributable to the rising maternal age at childbirth. The average mothers' age at first childbirth rose from 25.6 in 1970 to 30.4 in 2013. The total fertility rate was on a downward trend after dipping below 2.0 in 1975. It marked a record low of 1.26 in 2005 and started to increase after that. The total fertility rate reached 1.43 in 2013" (Statistics Bureau 2015, 15–16).

Until the mid-1960s, most marriages in Japan were arranged. Matchmakers played a significant role in traditional marriage. Nowadays, with the decline of arranged marriages, new types of matchmaker roles have developed. In the book *Family Issues on Marriage, Divorce, and Older Adults in Japan*, Kumagai writes that to assist people seeking dating opportunities, three new types of matchmakers emerged: commercial matchmaking and dating agencies, the local community and municipal offices, and

town-based marriage-meeting events (58–60). Despite the assistance of these new kinds of matchmakers, Japanese men and women still need to develop their courtship skills. Vogel points out that the traditional family pattern with clear gender roles discouraged socializing and encouraged people to form relationships only in the context of the accepted gendered segregation (155). Young Japanese men and women are still in the process of adapting to changing gender roles and dating practices.

The roles of husband and wife in the Japanese family are also in transition, as Vogel states, “The changing family structure and new values necessitated greater cooperation and intimacy between husband and wife. The strength of a family began to depend less on a prescribed structure, and more on the strength of the marital bond” (155). Instead of taking on all of the household duties on her own, nowadays the wife expects the husband to share housework and child care with her. However, influenced by the patriarchal tradition, it is not easy for the husband to give up his authority and superiority.

Japan’s sluggish economy in recent years affects a lot of Japanese families. Previously, the husband’s income could support the whole household, but now two incomes have become necessary to meet a family’s budget. Moreover, except for contributing to the family’s economy, many married women prefer to remain in the workplace for their own purposes. However, child care is a concern to many Japanese families with working mothers because of the shortage of nurseries and the heavier child care responsibilities of the mothers. In many cases, working mothers have to either give up jobs to take care of their children at home or take a part-time job instead of a full-time job.

Sexuality

Despite the variety of sex cultures within Japanese society, “celibacy syndrome” is becoming a national issue in Japan. According to the latest figures from the Japan Family Planning Association (JFPA), “more than 49 percent of those surveyed between the ages of 16 and 49 said they hadn’t had sex in the past month, with 48.3 percent of men reporting not having sex, compared to 50.1 percent of women who also reported being celibate in the recording period.” Pressure from work and disinterest in sex could be the reasons that sexual relationships between couples in Japan decline (Day 2015).

Xinhua News reported that “27 percent of men and 23 percent of women were not interested in having a romantic

relationship.” To the group aged 18–34, “61 percent of men and 49 percent of women are not involved in a relationship,” according to Japan’s population center. Moreover, of the group aged 18–34, “36 percent of men and 39 percent of women have never had sex” (Day 2015).

Politics

Women in the House of Representatives

Japan’s bicameral legislature is called the Diet, and it is composed of the House of Representatives (or the lower house) and the House of Councilors (or the upper house). Following the 2014 election, women took only 45 seats in Japan’s House of Representatives, constituting 9.5 percent of the total. Based on the percentage of women in the lower house of Japan, in 2016, the Inter-Parliamentary Union (IPU) ranked Japan 156th out of 191 countries (2016). As the majority of ministers are chosen from the House of Representatives, with such a low percentage, women can hardly gain access to political power. In her book *The Japanese Woman: Traditional Image and Changing Reality*, Sumiko Iwao attributes women’s underrepresentation in the House of Representatives to Japanese society’s prejudice against women and female politicians being “less successful at maneuvering funds and influence” (220).

Takako Doi

The most influential female politician in contemporary Japan was Takako Doi (1928–2014). As a member of the Japan Socialist Party (JSP), she was elected to the House of Representatives in 1969. Before she became the JSP’s leader, she was a prominent advocate of women’s equal rights. For instance, she was strongly against women-only home economics degrees and the father-dominated family registration law. Because of her pressure, the Diet signed the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW). Doi not only fought for women’s rights, but she also actively backed female party candidates running for office.

In 1986, Doi became the chair of JSP, which helped her make history in Japan, as she was the first female leader of a political party division in Japanese history. According to Iwao, Doi was chosen to be the chair of JSP “at a time of crisis, to play the role of sacrificial lamb. Yet Doi’s powerfully worded stumping speeches delivered in her distinctive Kansai-dialect twang were enthusiastically received throughout the country during both election campaigns

while she was chairperson” (228). Doi was the chair of JSP from 1986 to 1991. In 1990, her popularity helped JSP receive 136 seats in the House of Representatives, which was a record high number for the party.

Doi chaired the party again from 1996 to 2003. During this period, she renamed the JSP the Social Democratic Party (SDP). She recruited many young women with grassroots activist backgrounds into the party. Her leadership inspired women’s participation in politics.

Feminist Movement

After the Meiji Restoration in 1868, girls were required to receive elementary education, and women gained the right to request divorces. Women’s education and Western thinking encouraged the Japanese women’s movement. Fusae Ichikawa (1893–1981) cofounded the New Women’s Association with another Japanese feminist, Raicho Hiratsuka (1886–1971). In 1924, Ichikawa founded Japan’s first women’s suffrage organization, the Women’s Suffrage League of Japan. Japanese women’s suffrage was enacted at a national level in 1945.

After World War II, the mainstream Japanese feminist movement’s focus was to eliminate the exploitation of women within capitalist society. Organizing women into labor unions was the focus of the postwar women’s movement. In the 1960s, with the economic growth and industrialization in Japan, more and more women started to participate in the workforce. The number of employed women increased from 5.31 million in 1955 to 10.96 million in 1970.

The Japanese feminist movement in the early 1970s was different from the socialist-oriented women’s movement. Independent from any of the existing women’s organizations, it was dissatisfied by the postwar women’s movement’s neglect of sexual discrimination and women’s self-awareness. The early 1970s feminist movement aimed to establish women’s self-identity through raising women’s consciousness. It attacked the dominant culture’s discrimination of women and emphasized that women were oppressed not only by the social class but also by the rule of the men.

By the mid-1970s, Japanese feminists organized women’s liberation conventions and women’s liberation study-work camps. They also protested a proposed revision of Japan’s Eugenic Protection Law, as the revision aimed at prohibiting abortions for economic reasons (the original law in 1948 allowed abortions in some extreme

circumstances). Through their protests, Japanese feminists successfully defeated the proposed bill in the Diet in May 1974. According to Tanaka, “This protest marked the turning point at which the movement shifted its focus from consciousness-raising to action centered on specific social issues” (347). In the United Nations–sponsored 1975 International Women’s Year, the Headquarters for the Planning and Promotion of Policies Relating to Women was set up in Japan. Fusae and Ichikawa, both the Diet’s members, organized the International Women’s Year Action Group, focusing on the problems of sex discrimination in employment, education, mass media, government, and administration.

In the 1980s, women’s issue-oriented activities and grassroots activism continued to grow and develop. In the meantime, women’s associations and study groups were formed in academia. Women’s Studies received support and recognition from the Japanese government. When more women became employed in the 1980s, women’s social roles and family roles became important topics. Concerns raised included women’s employment, the environment of women’s workplaces, the lack of public day care facilities, and men’s participation in the domestic sphere. The bill to eliminate all forms of discrimination against women and protect women’s equal opportunity in employment was passed in 1985. The Equal Employment Opportunity Law came into effect in 1986, but the law did not specify the penalty and enforcement provisions.

At the end of the 20th century and the beginning of the 21st century, due to the sluggish economy in Japan, unemployment has hit women harder than men. Women’s traditional roles still figure significantly in Japanese families and society. To transform the sociocultural system, protect women’s equal rights, and improve women’s leadership, more and more women need to take action (Tanaka 1995, 343–352).

Religious and Cultural Roles

The Sun Goddess

In Kanji (the modern Japanese writing system), *Japan* is pronounced as “Nippon” or “Nihon” in Japanese. Literally, the name *Japan* means “the place where the sun rises.” The name manifests Japanese people’s worship of the sun, which is rooted in the indigenous religion of Japan: Shinto. Shinto, the oldest religion in Japan, emphasizes the worship of nature. In Shinto, the sun goddess Amaterasu is the divine ancestress of the imperial family. Her stories were

recorded in the *Kojiki*, a collection of myths and stories compiled in 712 CE, and one of the earliest extant sources for Shinto (Young 1993, 221–223). The first emperor of Japan, Emperor Jimmu (ca. 660–585 BCE), is believed to be a descendant of the Amaterasu.

Women's Diverse Roles in Religions

From prehistory to the Edo Period (1603–1867), women's religions included Shamanism, Daoism, Buddhism, Confucianism, Nativism, and popular religion. Shinto was not only the primitive religion in Japan, but it was also a collective term for several different forms of religion. Women's roles in Japanese religious history were diverse and complex. As Ambros describes in her book *Women in Japanese Religions*, women were shamans, nuns, patrons of religious institutions, lay devotees, and religious founders. Religious discourses about women's roles were also not unitary; “some idealized them as goddesses, Daoist immortals, Buddhist saints, or Confucian paragons of virtue, and others vilified them as demonic, polluted, and karmically hindered beings” (172).

Feminism and Religion

In their article “Editor's Introduction: Feminism and Religion in Contemporary Japan,” Kawahashi and Kuroki point out “many feminists regard religion as a tool of patriarchy that is still used to oppress and exclude women, and to deny them the opportunity to make their own decisions. Feminist thought can influence women's religious practice itself and transform it” (209–210). Reinterpreting and reconstructing religious traditions becomes a feminist strategy of self-empowerment. For instance, Mori finds “when women reread Nichiren in light of their own experiences as women, they suggest possibilities for transforming the discriminatory condition of the Buddhist community” (212).

The fetus memorial service (*Mizuko kuyo* in Japanese) is a still-current religious practice among women who have had a miscarriage, a stillbirth, or an abortion. According to Komatsu, this religious practice does not provide women who experience abortions with an exploration of the meaning of abortion or life but rather seeks a positive way to affirm and embrace life: “In that view, a living being in this world is no more than one configuration of a spiritual entity that exists in the continuum of past, present, and future. Consequently, abortion is an act decided within the relationship that encompasses the fetus and the

pregnant woman, and it takes its meaning within that person's life accordingly” (Kawahashi and Kuroki 2003, 211).

Women's Cultural Roles in the Lost Decades

The Heisei era (1989–present) comes after the death of the Emperor Showa (1926–1989). In the Heisei era, Japan went through economic stagnation, social malaise, and natural disasters. Thus, the years from 1990–2010 have been called “the Lost Decades.” In those years, women's cultural roles underwent many changes.

With the advancement of women's education, more women choose to enter the labor market and become wage earners, which can contribute to the low birth rate in Japan. In the meantime, some young people choose to delay marriage or stay single, which also results in the lower birth rate.

In terms of wedding rituals, influenced by the Christian weddings, many Japanese couples choose to have church weddings instead of the traditional Shinto weddings. As for burial rituals, women have the freedom to be buried in their own graves, though a lot of women follow the tradition of being buried with their spouses.

According to Ambros, the concept of “spirituality” attracts more women's attention. She has found a growing interest in spirituality in Japan's highly urbanized, late 20th-century society. The 1995 survey of divination-hall clients shows that women constituted 95 percent of the respondents; more than half of the clients were full-time employees, and about one-third were high school or university students (166–169). Many spiritual therapists are trained female healers.

Spirituality in the new era emphasizes individuality and personal gratification. It often integrates psychology and religion. Healing is one of the purposes of spiritual and religious practice. For instance, rather than stressing cyclical reincarnation driven by Karma—the presumed motivating factor behind Buddhist rites of posthumous memorialization—New Age views of the afterlife, promoted predominantly by female spiritualists, tend to emphasize an evolutionary model, according to which spirits progress through several lifetimes to achieve spiritual perfection (Ambros 2015, 168).

Issues

Aging Society and Low Birth Rate

In 1997, the working-age population began decreasing, and the labor force and the number of people employed also decreased. In the recent years, the reduction of the labor force, the falling birth rate, and the aging population

result in changes to the population's composition (Statistics Bureau 2015, 123). According to Xinhua News, "in 2014 Japan's birth rate plummeted to a record low at just more than one million infants, with just 1.3 million people passing away in the same period, the gravity of the population crisis speaks for itself. In fact, Japan's population institute has said that the overall population in Japan could tumble by 20 million to 107 million people by 2040" (Day 2015).

Care of the elderly has long been primarily viewed as a women's issue in Japan. In her article, Sodei summarizes the reasons why women take on the role of caregivers: the sex role differentiation in society, the ideology of the patriarchal stem family, the role expectations of others, and the feminine role identification of women (216). According to Sodei, nearly 90 percent of caregivers are females. Elders in Japan prefer to be cared for at home. Normally, if the frail elders are males, their wives are the primary caregivers; if the frail elders are females, daughters-in-law or daughters take on the role of caregivers. It is not uncommon in a Japanese family for the male to only take care of his parents, while the female is expected to take care of both her husband's parents and her natal parents.

Child care is also women's primary duty in the majority of Japanese families. Due to the lack of a public child care system in Japan, it is hard for mothers to balance work and child care. To keep their jobs and be unbounded by family, more women choose to postpone their marriages or stay single, both of which contribute to the lower birth rates in the country.

The Gender Gap and Inequality

According to the *Global Gender Gap Report 2015*, the World Economic Forum (WEF) ranked Japan 101st out of 140 countries in 2015 (2015, 9): "Japan (101) moves up three places from 2014 due to a similar near doubling of women in ministerial positions (from 11 percent to 22 percent)" (2015, 28). Since 2012, the Health and Survival gap remains unchanged, "at almost 98 percent the Economic Participation and Opportunity score has decreased since 2014, due to lower wage equality for similar work and fewer female legislators, senior officials and managers" (2015, 28). Sexism in the workplace and the family deprives women of equal opportunity.

Sexual Harassment

In his article, Kopp summarizes the sexual harassment that is widely accepted in Japan's public sphere, especially

within the workplace, which may include comments about women's appearance, jokes and comments that have sexual innuendoes, alcohol as an excuse for inappropriate comments and behavior, sexual advances to women, asking too-personal questions, placing pictures of scantily clad women as decorations, and sexually oriented business entertainment (Kopp 2014).

Japan did not pass sexual harassment laws until the 1990s; however, there was no penalty for violating the laws in a company. Instead, it is not uncommon to see that, in Japanese society, the women who are victims of sexual harassment are often blamed or punished. People's unawareness of sexual harassment cannot be understood apart from the Japanese cultural traditions that promote women's submission and men's leadership. Women are expected to become tolerant of men's sexual harassment, or to keep silent in many cases, to maintain the harmony and the male-centered social structure. Despite the advanced education they have earned, female employees are still expected to fulfill some subordinate duties for their male counterparts, such as serving tea and answering phones.

Sexual harassment on the trains is also an issue, according to the *Japan Times*, "Usually male and preying on young females, gropers take advantage of the anonymity of a crowded train where body contact is unavoidable to molest their victims or sexually harass them verbally in low tones" (Fukada 2009). In 2008, in Tokyo alone, there were some 2,000 reported cases. According to the Metropolitan Police Department study, "most attacks occurred on trains, primarily during morning rush hours. Almost half of the victims were in their 20s and more than 30 percent were teenagers" (Fukada 2009).

Sex Industry

According to Jeffrey Hays's article "Prostitutes, Soaplands, Sex clubs and the Sex Industry,"

Not only is the sex business impressive in its size, it is also impressive in its variety. In Japan you can find brothels that fall under the names of Soaplands, Image Rooms, Fashion Health, Pink Salons, Delivery Health, Cabaret Clubs, Turkish Baths and massage parlors with names like Love Station Lounge.

The weekly magazine *Spa!* estimates that there about 225,00 women working in the sex trade. These included 48,000 women who work at Japan's 1,000 "fashion health" and "image clubs"; 25,300 who work at the 1,265

the soaplands, 16,000 who work at the 1,000 “delivery health,” 28,430 who work at pink salons, 75,000 who work in cabaret clubs and 20,000 who work at S-and-M clubs. (Hays 2013)

Prostitution, also called *fuzoku* in Japan, is illegal. However, to dodge the law, for instance, soapland (a place where men go for massages or sexual services) operators claim, according to the *Japan Times*, “male clients and their hired masseuses perform sex as couples who have grown fond of each other” (Hongo 2008). Thus, the male customer can have sex with his “acquaintance.” Based on the statistics released by the National Police Agency of Japan, in 2006, “there were approximately 1,200 soaplands in Japan and 17,500 sex-related businesses, including massage parlors and strip clubs” (Hongo 2008). It was suggested that the sex industry was a ¥1 trillion (equivalent to about \$8.75 US dollars) industry.

Pornography and Sexual Violence

In her article *Pornographic Culture and Sexual Violence*, Kuniko Funabashi describes Japanese pornography: “The theme of pornography in comics, videos, and advertising is the use of the nude or partly nude females or disassociated parts of female bodies. Depictions of women bound, beaten, and raped are crude and highly suggestive” (Funabashi 1995, 261).

According to Funabashi, the history of present-day pornographic comic books or magazines (manga) in Japan can be traced back to the Edo period (1603–1868), when a growing market for pornographic prints and advances in the technology of the printing press promoted the development of the new genre for popular consumption. Nowadays, manga sales are the main source of many publishers’ incomes (Funabashi 1995, 256). In addition to manga, adult videos also have a huge market share of pornography. Both pornographic manga and adult videos objectify women and commercialize the female body. They reinforce women’s oppression, weakness, and submission through sexual violence, such as rape, sexual harassment, torture, beating, and so on. They also badly influence Japanese youths’ understanding of sexuality and gender identity through violent pictures, unethical plots, and stereotyped femininity.

Driven by profits, Japan’s pornography industry creates about 20,000 films every year. Annually, the industry is worth up to ¥500 billion (equivalent to about \$4.38 US dollars), according to the activists who are against Japan’s porn

industry’s abuse of young women. Most of the women who work in the industry are in their twenties. Some of them are forced to perform in the sexually abusive films against their will; some are forced to engage in repeated intercourse without protection and are even gang-raped during filming (AFP-JIJI 2016). However, the government and the laws cannot protect these female victims in the industry.

Another issue in the Japanese pornography industry is child pornography in manga comics and animation, which has not been banned by Japanese laws. According to Reuters, Japan’s national data shows a rise in child pornography crimes, with police uncovering 1,644 cases in 2013, around 10 times higher than a decade ago. Over half of the cases involved sharing or selling photos or videos over the Internet. Moreover, young girls can easily become victims in child pornographic manga. “Japan’s fascination with young women as sexual objects is apparent from a quick glance through Japanese bookstores and subway ads featuring ‘junior idols’ as child models” (Ando 2014). As long as there is a market for child pornographic manga, the depiction of sexual abuse and violence to young girls will continue.

K

Kazakhstan

Overview of Country

Kazakhstan is located in Central Asia and is the biggest landlocked country in the world. It is bound by Russia to the north; the Caspian Sea to the west; Turkmenistan, Uzbekistan, and Kyrgyzstan to the south; and China to the southeast. The country is a former republic of the Soviet Union, and it gained independence as a state on December 16, 1991. It is roughly 1,052,089 square miles (2,724,900 sq. km) and consists of a steppe that ascends from a level plain around the northern beach front locale of the Caspian Sea to the nation's east. As of April 2016, the population of Kazakhstan was estimated at 17.4 million people (Trading Economics 2016). In 2015, the UN Development Programme (UNDP) ranked Kazakhstan 52nd out of 188 nations based on the Gender Inequality Index (GII, 0.267).

The population of Kazakhstan consists of approximately 120 ethnic groups, in which Kazakhs are a slight majority (Matuszkiewicz 2010). Muslims form approximately 65 percent of the country's population, whereas Russian Orthodox Christians are about 25 percent, with other groups including Jews, Roman and Greek Catholics, various Protestant denominations, and others comprising less than 5 percent (USCIRF 2015). According to the World Bank, Kazakhstan is an upper middle-income country,

with gross domestic product (GDP) of nearly USD\$10,500 per capita in 2015.

In one volume in a series produced by the UN Educational, Scientific and Cultural Organization (UNESCO), titled *History of Civilizations of Central Asia*, the authors state that two of the central problems in the history of the Kazakh people were their origins and the formation of the Kazakh statehood and culture (UNESCO 2005). Incorporating Kazakhstan into the Russian empire in the 1990s fundamentally altered notions of individual and collective identity of its people. Other factors were the exposure to European culture under czarist rule as well as the ruthless and massive social, economic, and cultural restrictions placed on the country under Soviet power (Akiner 1995). As an independent nation, Kazakhstan embarked on extremely challenging processes of reinterpreting its history and cultural identity that were fraught with ambiguity in the face of 21st-century capitalism. These processes did not take place in a vacuum but were concomitant with profound social and economic change (Akiner 1995).

A major economic crisis occurred in Kazakhstan following the collapse of the Soviet system, and there was an unstable transitional period that severely affected women's issues in the country. The World Bank reported that, in 1999, it hit a record low GDP of USD\$16.90 billion. An adviser to the government task force on gender policy in Almaty (from 1929 to 1936, Almaty was the capital of the Russian Kazakh), Galiya Khassanova, wrote in 2002 that

the status of women had worsened because of the economic downfall that hit the country following independence. Khassanova described the privileges that women enjoyed under the Soviet Union, such as paid maternity leave for a up to one year and unpaid up to three years and laws that prevented the firing of new mothers during those times. Women underestimated the state's medicinal services arrangement of obstetric facilities, gynecological organizations, sanatoriums, and maternity hospitals that provided health services and care free of charge. Khassanova mused, "Much has changed since those days. Now I look back and wonder if we really were equal or if we simply were satisfied with our status. I also wonder how much we have lost by sacrificing our status to men without a struggle. So the questions are, should we strive for equality? Or should we cry about the loss of social protection?" (Khassanova 2000, 385).

In 2010, Madina Jarbussynova, ambassador-at-large of Kazakhstan's Foreign Affairs Ministry, delivered a speech at the 54th session of the UN Commission on the Status of Women. She said globalization and the financial crises were hindering the implementation of commitments taken by the country under the Beijing Platform for Action and the Millennium Development Goals (MDGs) to promote gender equality and women's empowerment. She also stated that Kazakhstan considered gender equality to be important for sustainable economic growth and social development and that, at the time, women constituted 14 percent of the members of the Parliament, 58 percent in the civil service, and 10.3 percent in the decision-making processes.

Since gaining political autonomy, Kazakhstan has made great strides toward accomplishing goals of gender equality. The policies and laws of the country acknowledge the essential concept of nondiscrimination based on gender. On June 1998, Kazakhstan joined the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW). Kazakhstan has also ratified the Convention on the Political Rights of Women and the Convention on the Nationality of Married Women.

Moreover, the state ratified international agreements that deal with civic engagement, politics, economics, and social and cultural rights. The country has joined more than 60 international treaties on human rights (Republic of Kazakhstan 2005). Kazakhstan has additionally established the Law on Combating Domestic Violence, which helped victims and survivors of physical, mental, sexual, and financial violence gain access to social, legal, and

medical services. The government has also introduced and implemented policies in public institutions that mainstreamed gender equality. At the fourth Forum of Women of Kazakhstan, held in Astana in September 2004, the country's president instructed the government and the National Commission on Family and Women's Affairs to establish the Strategy for Gender Equality. Each chapter in the strategy included indicators to measure the conditions for gender equality in political, economic, educational, familial, and medical institutions and to establish policies aimed at preventing violence against women and children. The overarching objective of the strategy was to create an environment with improved conditions that allowed men and women to attain their human rights and not have to deal with any form of gender-based oppression and violence (Republic of Kazakhstan 2005).

Following the implementation of the country's Strategy for Gender Equality, the Asian Development Bank (ADB) published a gender assessment in 2006 and later in 2013. The ADB reports state that despite principles of gender equality being defined and mainstreamed in Kazakhstan's development plans, implementing and achieving the equality agenda still operates in a top-down hierarchical structure. The country, which witnessed increased GDP in its economy in recent years, has shaped a positive external image as a role model in the region through taking leadership in promoting stability and collaboration in Central Asia. The country's adoption of and progress in mainstreaming gender equality has been noticeable, yet slower than other development processes. Kazakhstan has a consistent record of high rankings in equal access and opportunities to education and health outcomes for women, "but this is counterbalanced by limited progress in women's political empowerment and improving women's access to economic opportunities" (Duban 2013, x).

Girls and Teens

According to the *CIA World Factbook*, Kazakhstan has 2,319,233 females under the age of 15 and 1,366,655 females 15–24 years old (CIA 2016). Child marriage is the most urgent issue that threatens young girls and teens in the country. According to the Population Reference Bureau (PRB), "This harmful traditional practice not only violates the human rights of girls and young women, but also threatens their health and well-being" (2013). In the fourth *Millennium Development Goals Report* that the Government of Kazakhstan prepared with the UN Country Team

in 2010, official statistics indicated an increase in infant mortality to 20.7 per 1,000 live births, where the mortality of girls was 18.48 per 1,000 live births. However, the report stated that poor-quality family planning and HIV prevention services provided to young women and girls were still not sufficient (Carrel 2010, 72). In 2009, “the birth rate among teenage girls aged 15 to 19 years, 31.1 per 1,000 girls of this age group, was high and has not been declining over the past few years” (Carrel 2010, 79). The report concludes that little progress has been accomplished in increasing awareness and educating Kazakh girls, women, and men about sexual and reproductive rights and well-being.

Education

The rapidly growing economy of Kazakhstan allowed it to implement major reforms, including in education. Under Article 30 of the 1995 constitution, Kazakh citizens have the right to free secondary education as well as free higher education in public institutions. The country landed at the top of UNESCO’s Education for All Development Index for scoring high in the percentage of children of primary school age who are enrolled in primary schools. Kazakhstan enjoys a high literacy rate at 97 percent (Stateuniversity.com 2016).

According to the Education Policy and Data Center’s report, the official primary school enrollment age in Kazakhstan is seven. The school system is structured so that the primary school cycle is four years (ages 7–10), the lower secondary is five years (ages 11–15), and the upper secondary is two years (ages 16–17). The total number of students enrolled in primary and secondary education at the time of the report in 2014 was 2,693,000. Of these students, 39 percent were enrolled in primary education (EPDC 2014). A report that monitored the progress in girls’ education found that Kazakhstan had no significant gender inequality in learning (King and Winthrop 2015, xii). The World Bank data for the MDGs of Kazakhstan indicate that the survival rate to the last grade of primary education for both sexes is 99 percent, and the primary completion rate for both sexes is 114 percent (World Bank 2014).

An overview of Kazakhstan’s educational system conducted by Stateuniversity.com shows that equal education opportunities for boys and girls was a major goal of the Soviet Union and remains important for the country after independence: “Historically, before 1917, education of girls was organized within families to teach girls to accept the traditional women’s roles as wives, mothers, and cooks. In

1920 and 1921, only 1,900 ethnic Kazakh girls attended schools. In the years 1966 to 1976, this number rose to 424,759 and, in 1999, the number rose to more than 1 million. All schools are coeducational” (Schooluniversity.com). In a report monitoring education in Kazakhstan, the UN International Children’s Emergency Fund (UNICEF) confirms the high rates of equity in educational opportunities across gender, region, and income. There is less than 1 percent difference in primary school attendance rates between boys and girls. “In secondary school, these trends continue, except for children from the lowest income bracket, with the poorest children being 2.7 percent less likely to attend school” (UNICEF 2010, 3).

Health

Researchers noted that when Kazakhstan was still under the Soviet government, citizens had access to free medical services with the socialist model of health care institutions. In the 1980s, Kazakhstan had a health care structure that provided free public medical care, even to rural communities. After independence, and during the turbulent transitional period the country experienced in the late 20th century, women were placed at greater risk than men of being physically unwell. Danilovich (2010) conducted a study that examined the growing socioeconomic inequalities in the transitional country through close monitoring of policies affecting women’s access to reproductive health care. The results of the study suggested that the introduction of market relationships in Kazakhstan brought about a higher unemployment rate, loss of child care and maternity benefits, and lower earnings. These issues “reflected in new negative trends in the health of female population, such as decreased life expectancy and birth rate, sharply increased abortion rate and violence, [and] higher incidence of HIV/AIDS and sexually transmitted diseases” (Danilovich 2010, 30–31).

According to the World Bank, Kazakhstan still confronts challenges in reforming health care institutions and services provided to the public. When compared to its prospering economy, the nation’s health care fails to keep pace. The World Health Organization (WHO) reported that Kazakhstan’s life expectancy at birth for both sexes increased by five years over the period 2000–2012.

But the country’s premier English-language newspaper, the *Astana Times*, published a report on March 30, 2015 (Witte 2015) discussing how women’s health coverage in Kazakhstan is becoming more comprehensive. The

Ministry of Healthcare and Social Development said that a decree established in 2009 made health care services free of charge to all citizens. For women, these services included gynecological exams, abortions, and intrauterine devices (IUDs). The author stated that women could access these services through prenatal centers, maternity hospitals, and gynecological departments of hospitals. Additionally, the ministry confirmed that “article 96 of the health code system dictates that individuals have the right for free reproductive choice, reproductive health protection and family planning services, infertility treatment, and the use and free choice of contraceptive methods. And article 104 of the code, dated September 29, 2009, gives women the right to an abortion” (Witte 2015).

The Ministry of Healthcare and Social Development explained that the state started giving more attention to diseases affecting women’s health. Since 2008, women have had access to free mammograms and cervical cancer screenings for early detection of diseases. In 2013, the government offered a free HPV-vaccination program to girls aged 11–15 in different cities. The newspaper article quoted a number of Kazakh women saying that accessing governmental health care services could be a challenge in rural communities. The women also mentioned problems with a lack of women’s specialists in the country, insufficient information dissemination about family planning and contraceptives, and low quality of services provided by doctors in free public clinics. Galina Grebennikova, the executive director of the Kazakhstan Association on Sexual and Reproductive Health, said that the state has done a lot to improve the health care services for women. But, she stated, “We have to do much more in the future including developing a new state program of healthcare, improving access to different contraceptive methods and allowing NGOs to provide social projects” (Witte 2015).

Employment

Reports indicate that the boom in Kazakhstan’s economy did not boost the job market in providing equal opportunities for women and men. The gender gap for labor force participation is 10.7, according to the ADB report on gender equality and the labor market (Duban 2013, xi). The report also states that domestically there is a problematic gender division of labor, with women being solely responsible for household tasks and catering work at 2.7 hours per day. Women have a lower employment rate than men, with an employment gap at 11.6 percentage points. The

report explains that young women often require more persuasion to enroll in nontraditional studies that will open up future employment opportunities for them.

Kazakhstan has a constitution and labor laws that guarantee equality and nondiscrimination. However, the definitions contained in the policy documents are vague, and no one can be certain about interpreting them (Duban 2013, xv). According to the report, the number of women in decision-making positions has progressively increased. “At the beginning of 2010 there were 19 women in the Mazhilis, the lower house of the bicameral parliament of Kazakhstan, representing 18 percent of the total number of Mazhilis members” (Duban 2013, 1–3). The ADB also mentions that the 2008–2009 global economic crisis affected Kazakhstan, hitting the construction, oil, and gas industries the hardest. Women in these sectors are often employed in low-paying positions and more vulnerable to dismissal. “Given women’s particular needs regarding maternity and sick leave, informal work arguably contributes to women’s vulnerable position in times of crisis” (Duban 2013, 2–3).

Other experts stated that, after independence, job placement in Kazakhstan was not gender blind. The Defense Language Institute Foreign Language Center (DLIFLC) stated that women in Kazakhstan “were overwhelmingly assigned to professions such as healthcare and education, which were deemed suitable for females according to Slavic social norms. Women were also recruited into the government and party hierarchy, attaining high-level positions within the Soviet Union’s vast political and economic administrative apparatus” (DLIFLC 2009, 34–35). Also, in a summary of Enterprise Surveys data for Kazakhstan focusing only on manufacturing, the World Bank provides statistics that place the country at a high rate of women’s access to equal jobs and decision-making positions. Kazakhstan has 28.3 percent of firms with female participation in ownership, compared to all countries at 34 percent. It has 18.9 percent of firms with a female top manager, compared to the global percentage of 17.3. The number of firms with majority female ownership is 16.4 percent in Kazakhstan, when it is only 11.2 percent worldwide (World Bank 2014). The *Astana Times* reported in March 2016 that there were about 700,000 enterprises run by women. The chairperson of the Council of Business Women of Kazakhstan, Lyazzat Ramazanova, stated, “Women run 697,355 enterprises and, in general, there are 1.44 million women engaged in business. Therefore, we must help women to establish and develop their businesses” (Voronina 2016).

Despite the progress in economic climate and employment rates, the ADB reports confirm that clear gender-based inequalities exist in the country. A survey that asked gender analysts in Kazakhstan to examine and determine the reasons that cause violations of women's rights and gender inequality and some of the analyses blamed the economic domain. "Among the most common answers were 'finding a job' (66.3% of respondents) and related issues such as 'the type of work [available to women] is non-prestigious, low skilled, and in low-paid sectors' (65.2%), 'the system of pay rises' (53.8%), 'entrepreneurism' (48.1%), and 'the pension system' (31.4%)" (Duban 2013, 19–20).

But the Kazakh government remains optimistic and aware of the challenges that hinder women's increased, equal, and fair participation in the labor market. Former minister of labor and social protection and current secretary of state of Kazakhstan, Gulshara Abdykhalikova, met with the Eurasian Competitiveness Programme (ECP) of the Organization of Economic Cooperation and Development (OECD) on February 27, 2015, to discuss intensifying efforts of women's involvement in the Kazakh economy. They also discussed "increasing cooperation to investigate and eliminate barriers to gender equality in education, employment and entrepreneurship, as well as ways to reach international standards on gender issues" (Voronina 2015). Experts have recommended in recent reports that for Kazakhstan to address its gender division of labor, it must address limitations of women's enterprise access and come up with measures to ensure that they have equal access to tools that enable them to excel in the job market.

Family Life

Historical concepts of gender in Kazakhstan resemble the traditional and stereotypical gender roles and relations where women made clothes and prepared meals at home and men were the breadwinners. Postindependence, the government promoted gender equality and that both men and women should contribute to society's economic production outside of the domestic sphere. Despite these efforts, only a small percentage of management positions are held by women, largely due to the perception that men are better decision makers (DLIFLC 2009, 34–35). The ADB reported survey results where respondents said catering is the essential role Kazakh women assume and that, even when women have become part of the workforce outside their domestic life, they still held a central role inside family life. Other respondents said that, ideally, men

hold higher positions in society because of their gender. "Due to domestic burdens, women may have insufficient time for self-education, professional training, or entrepreneurial activities. Gender stereotypes also have negative impacts on men. Several female respondents to this assessment raised the issue that men's primary role as the financial provider for the family means their participation in child rearing is limited" (Duban 2013, 13–14).

Human Rights Watch (HRW) released a report on July 23, 2015, stating that Kazakhstan failed to protect LGBT people from violence, and that LGBT people face hostility and abuse, a lack of sufficient response and support mechanisms, "and an intensified climate of fear amid recent efforts to atop an anti-LGBT law" (HRW 2015). The report titled *"That's When I Realized I was Nobody": A Climate of Fear for LGBT People in Kazakhstan* states that, in 1998, the country decriminalized consensual same-sex conduct; yet, an intensely homophobic atmosphere persists. "A 2009 survey of nearly 1,000 LGBT people conducted by the Soros Foundation–Kazakhstan found that more than 81 percent of respondents felt that gay and lesbian people "face disapproval and disrespect from those in the general population." Kazakh sexual and reproductive health experts have commented that sexuality remains a sensitive topic in Kazakhstan (HRW 2015). The National Public Radio (NPR) reported on August 21, 2015, that many people in the LGBT community say their rights are not equally protected. The country's laws are codified in ways that make it almost impossible for transgender people to change their gender identity in personal identification documents. "Activist Tim Shenker, a transgender man, says the law won't allow him, as a Kazakh citizen, to change his documents until he has undergone full sex-reassignment surgery" (Flintoff 2015).

In 2012, EurasiaNet.org reported that the military was not accepting gay men because the state classifies homosexuality as a "disorder," according to Kazakhstan's defense minister, Adilbek Dzhaksybekov. This attitude toward LGBT people is not uncommon. The Soviet Union criminalized homosexuality, regarding it as a mental disorder, and sodomy. "Homosexuality and lesbianism remain largely taboo topics in Kazakhstan, with many lesbians and homosexuals preferring to conceal their sexual orientation. Those who are 'out' tend to face discrimination" (Lillis 2012). When cases of aggression and violence occur against LGBT people, the state laws do not provide special protection or support for them. In April 2015, the English-language news Web site in Kazakhstan, Tengrinews,

reported that two men killed another man after confessing to them that he was gay. They claimed that they were insulted by the fact that they had drunk from the glass shared with the gay man. The crime was classified as “a crime committed with extreme atrocity by a group of people from molester motives” in the Criminal Code. “The discourse of LGBT human rights in Kazakhstan is problematized by the absence of both legal framework and lack of desire to open a constructive dialogue between the law enforcement, human rights organizations and general population” (Kamalova 2015).

A huge controversy in 2014 sparked the filing of multiple lawsuits over a poster that shows two male cultural and historical Kazakh figures kissing. The advertising agency Havas Worldwide Kazakhstan designed the poster depicting the composer and folk artist Kurmangazy Sagyrbaiuly (1823–1896) and the poet Aleksandr Pushkin (1799–1837) kissing. The plaintiffs were seeking 34 million tenge (approximately USD\$186,000) as compensation for damages. The poster created contentions in social media outlets, which urged leaders of the Bolashak (Future) national movement to organize a roundtable against homosexuality. Bolashak leaders called on the country’s legislators to adopt a law banning LGBT “propaganda.” HRW responded, “Laws criminalizing propaganda of ‘nontraditional sexual relations’—which are blatantly discriminatory and contrary to international human rights norms—have no place in Kazakhstan. Kazakh officials should firmly reject any attempts to introduce such legislation” (HRW 2014).

In 2015, HRW offered numerous suggestions to the legislatures of Kazakhstan in support of LGBT populations, including recognizing the magnitude of violence committed against them, and advised the government to work with activists and human rights organizations to take extensive precautionary measures that protect this vulnerable population. HRW additionally suggested that Kazakhstan revise its gender identification processes and allow transgender people to amend their gender identity legally and on all official documents through a transparent procedure that is free of medical examinations or coercion.

Politics

The Parliament of the Republic of Kazakhstan states that the constitution passed in August 30, 1995, approves of the Parliament of two houses as a high representative organ of the country realizing legislative functions. The Parliament consists of two chambers: Senate and Mazhilis (Parliament

of the Republic of Kazakhstan 2016). The current president of Kazakhstan, Nursultan Nazarbayev, who assumed office on December 16, 1991, was reelected in 2015 with 97.7 percent of the vote (Sholk 2015). Although in the constitution Kazakhstan declares itself a democratic, secular, legal, and social state with values focused on the well-being of the individual, his or her life, rights, and freedoms, the country’s contemporary political culture is “characterized by conservatism” (Sholk 2015). The Inter-Parliamentary Union (IPU) has ranked Kazakhstan at 54th among 139 countries classified in descending order of the percentage of women in national parliaments. There are 29 women within the 107 seats (27.1%) in the lower or single house after the March 20, 2016, elections (IPU 2016).

In 2014, UN Women conducted a workshop with members of the Parliament, government officials, and members of the National Commission for Women to discuss the topics of temporary special measures to enhance women’s political participation in Kazakhstan. “Women are under-represented in all areas of political life in Kazakhstan and have not achieved the critical mass that is necessary to have an effective voice in policy-making. The training was requested to specifically address this shortfall and to help Kazakhstan achieve the targets set forth in their international commitments” (Bardall 2014).

Religious and Cultural Roles

Muslims form the majority of the population of Kazakhstan. In 2009, the Kazakhstan National Census included, for the first time after Soviet rule, a question on religious affiliations (Alma 2015). The results indicated that 97 percent identified themselves with a certain religion. Among those were 70.1 percent who were Muslim, 26.1 percent Christian, 0.03 percent Jewish, 0.09 percent Buddhist, and 2.8 percent were nonbelievers. According to Sultangaliyeva Alma, these figures “reflect not so much the degree of ‘religiosity’ of the population as much as ‘ethno-religious identity.’ The interweaving of religious and ethnocultural identity is a phenomenon common to many post-socialist societies” (Alma 2015).

Alma discusses the revival of religion after independence in Kazakhstan and how it impacted the status of women, particularly Muslim women, in society in negative and positive ways. For example, religious piety emerged as a way for women to express their religious identity. Coexisting with mainstream secular traditions in the country, this new phenomenon of religious piety had a strong

impact on the perception of gender roles. “New Islamic piety assumes a gender hierarchy and a return to the ‘traditional’ division of labor in which a woman is ascribed a subordinate role. This approach is seen as a reversal of the ‘traditional’ Soviet-inspired notion of gender equality” (Alma 2015). Interestingly, the analysis of data collected by Alma indicated that the process of reforming religion has created new avenues of women’s empowerment and self-expression in religious spaces.

As a professor of philosophy at the Kazakh National University of Almaty, Saniya Edelbay wrote in her article about culture and Islam that she had witnessed the number of female students wearing the hijab (headscarf) increase in recent years, not just in her classes but in other departments as well, such as philosophy, political science, international relations, and economics. Culturally, she noted that the hijab is not part of the traditional attire that Kazakh women wear. Specialists suggest that the young people, especially young women, strive to study and to practice Islam, but it is very hard to draw a line that separates cultural traditions from religious practices in Kazakhstan. “Kazakh national traditions are closely connected with religious ones. Islam penetrated the elements of Kazakh nomadic tradition” (Edelbay 2012, 123). Edelbay argues that it became a challenge to balance and settle the differences between Islam and traditions. The contradictions between the two mostly become visible in relation to the hijab. President Nursultan Nazarbayev criticized the new trend of women wearing the hijab. “He criticized the youth that started to wear the hijab in schools. . . . The question whether women should wear the hijab or not is one of the sensitive issues under discussion in the contemporary Kazakhstan society” (Edelbay 2012, 124).

An article in the *Astana Times* stated that, as a young state, Kazakhstan faces the challenge of uniting more than 120 ethnicities. Describing the multiple religious identities of the country and religious spaces she visited, the reporter discussed the urgency of addressing questions at frequent interreligious conferences that take place in the capital, Astana. “If we are talking about necessary structural changes in civilizations, we have to address the fact that women are often systematically excluded from decision-making processes, both in peace and war times. How can a global society create sustainable concepts without bringing the knowledge and needs of the female population into international fora?” (Gelis 2014).

Scholars noted that the relative religious freedom the post-Soviet Kazakhstan experienced coupled with

economic insecurity and the rise of traditionalism during the country’s transitional period had affected marriage, childbearing, and parenthood conditions. “These factors potentially impact Muslim women in the region differently than their Christian or non-religious counterparts” (Anderson and Becker 2008, 10). The authors also stated, “Muslim women were less likely to use modern contraception or abortion or engage in premarital sex. Contraceptive knowledge and use—differences between Muslim, Christian, and non-religious women—were evident” (Anderson and Becker 2008, 47).

To counter the religious narratives and traditional practices that negatively impact women’s lives in Kazakhstan, Muslim women established the Society for Muslim Women (SMW) in 1990 in Almaty. The organization is unique in its emphasis on Islamic spirituality and what it proclaims to be “traditional Kazakh culture” as the core of its community activism. SMW defines its mission as an informal grassroots religious movement. Discovering how little the community actually knew about Islam, the nongovernmental organization (NGO) started educating people in addressing family and marital problems (Snajdr 2005, 298).

Issues

Child and Forced Marriage

Due to its multiethnicity, Kazakhstan has ethnic and cultural traditions deeply rooted in some communities that challenge state laws. Reports have indicated that practices of early and forced marriages still pose a threat to many Kazakh girls and young women. During the conference organized by the Women’s League of Creative Initiative of Kazakhstan, held on January 27, 2015, in Almaty, researchers indicated that most cases of early marriages and bride kidnapping occur among ethnic minorities. “Early marriage is typical for the Uighur population. They believe that a girl who doesn’t marry before the age of 18—has failed.” In Almaty oblast, 56.3 percent of girls aged 15–19 years have completed secondary education out of a total of 84,684 girls, and 4.8 percent of all total married women are in this age category (Asia 2015).

A 2012 study conducted on child marriage in South-eastern Europe and Central Asia, including Kazakhstan, stated that the country had cases of girls being married off as a means of continuing their younger siblings’ education (Nihlen and Aguirre 2012, 12). Scholars noted that the problem of child marriage is attributed to social, cultural,

and economic challenges that families of young girls and women face in rural areas. Another reason for child and forced marriages is the stereotypical ideology of women's subordinated status in families and their subjection to the parents. Research by the UN Population Fund (UNFPA) on child and forced marriage found that, while data and statistics were scarce, "unregistered marriages involving girls under the age of 18 seem to be growing in prevalence in some rural areas, and among some ethnic groups (including the majority Kazakhs)" (SIGI 2014). The process by which child marriages were conducted and legalized, the research found, was a religious ceremony that makes the marriage illegal; hence, the wife loses her basic rights for protection and human dignity. "Only marriages contracted in a state registry office are legally recognized in Kazakhstan; religious marriages have no legal validity. Child spouses interviewed by UNFPA had often been married against their will, and reported physical and sexual abuse, and labor exploitation" (SIGI 2014).

In 2011, the country introduced a new Law on Marriage and Family, "where the statutory minimum age of marriage for women and men is 18. However, in cases of pregnancy or if a child has already been born to the couple, a civil registry office may lower the minimum age for marriage by up to two years, with the consent of the intended spouses and their parents or guardians" (SIGI 2014). In the concluding observations report on Kazakhstan that the UN Committee on the Rights of the Child presented on October 30, 2015, the committee recognized positive measures taken by the state party to prevent child and forced marriages. However, the report reiterated the number of girls continuing to be subjected to early and forced marriages, especially in rural areas and southern Kazakhstan regions. The committee urged the government to ensure that the minimum age of marriage of 18 years for both girls and boys is enforced throughout the country. The committee also asked the Republic of Kazakhstan to develop awareness campaigns and programs on the harmful effects of early marriages on the physical and mental health and well-being of girls, targeting parents, teachers, and religious and community leaders, and to establish protection schemes for victims of early and forced marriages who file complaints (OHCHR 2015).

The UNFPA carried out a study in 2014 on child marriage in Kazakhstan while also reviewing national legislation and the country's ratification of the various international standards related to the issue. According to the study, the total number of marriages was 16,494,

with 1,373 brides under age 18 and 79 grooms under age 18 (UNFPA 2014). The numbers indicate that the issue of child marriage needs policy makers, parliamentarians, communities, and families to address it and to protect girls' rights and provide them access to livelihoods, social support, and health programs for sexual and reproductive health.

Kyrgyzstan

Overview of Country

Kyrgyzstan is located in Central Asia along the Silk Road. It is surrounded by China in the east, Kazakhstan to

the north, Uzbekistan in the west, and Tajikistan in the south. The country is approximately 77,182 square miles (199,900.46 sq. km) and is dominated by two mountain systems: the Pamir and the Tian Shan. The population was 5.72 million in 2013 and has continued to steadily increase since the 1960s (World Bank 2015). The *Human Development Report 2015* ranks Kyrgyzstan at 67th of 188 on the Gender Inequality Index (GII) (UNDP 2015).

The Soviet Union (USSR) had extreme influence on every aspect of life in Kyrgyzstan, especially in the lives of women. The area that is now the democratic country of Kyrgyzstan was under USSR control from 1924 to 1991. Under the USSR's rule, women were encouraged to work, which resulted in the number of working women and students being one of the highest in the world (Kuehnast and Nechemias 2004). Also, while promoting women, the USSR suppressed the Islamic background of people (Blackburn 2011). As a result, some women stopped wearing the veil.

After the fall of the USSR, the living standards of women disintegrated (Blackburn 2011). Budget cuts dissolved government assistance programs that had primarily helped women and children (Ishkanian 2003). Further, free health care and education were terminated, which created barriers for women to obtain degrees (Akiner 1997). Finally, policies from the USSR era that assisted women in the hiring process—for example, gender quotas—were dissolved. With the fall of the USSR came a call to establish a national identity, and this caused a resurgence of traditionalism and Islam. This process is what Graney (2004) refers to as “retraditionalism” or a “revival of masculinity” (45).

Present-day Kyrgyzstan struggles with many issues from the past and new issues from today's global pressures and local governmental corruption. There are accusations of “distortion of justice” during the violence when President Askar Akayev was overthrown for becoming authoritarian and corrupt in the 2010 Tulip Revolution. Violence against women is often not reported, and the LGBT community is not protected in the same ways as its heterosexual counterpart.

Girls and Teens

In Kyrgyzstan, growing into the adolescence stage is different for girls and boys. Girls are considered *balagatak toluu*, or a teen, at age 9, and boys enter their teens at age 12. Officials and parents view girls and boys in their teens as risky and keep them under strict observation. The teen-age years are referred to as *ovzrast smiatentia*, or age of

confusion, because teens often rebel and commit various acts that range in severity (running away, attempting suicide, or dropping out of school) (Ismailova 2007).

Girls are taught how to do household chores at a young age (e.g., cooking, sewing, etc.). Boys are expected to work in the villages or on the farms and are taught how to interact with others in a way that is desirable. The entire community curtails the behavior of young girls in Kyrgyzstan. Girls are not permitted to date openly or to drink or smoke in public, especially in rural areas. For chores, girls are taught at a young age, and they are socialized to be a wife, a mother, and a cook and to maintain the home. Mostly, urban parents teach their daughters to be successful and independent. However, even with the teachings of being self-sufficient that the urban parents give, they still teach their daughters “to be good wives” and mothers (Ismailova 2007).

Education

Education is a cornerstone of facilitating gender equality. Clark, Roy, and Blomqvist (2008) suggest that the development of gender equality is heavily influenced by women's empowerment, and empowerment is dependent on education. Further, education creates more opportunities for women to prosper and move up the ranks (Carbone and Lister 2006). Post-USSR, this region suffers greatly from a lack of educational funding. Hanks (2005) found that some schools are in such financial crises that they lack basic amenities such as heat. Another barrier to education is language. The call to establish a national identity has led to youths being taught their ethnic languages rather than Russian (Hanks 2005). In fact, many USSR teachers have migrated out of Kyrgyzstan because of their inability to teach these other languages (Blackburn 2011).

The youth of Kyrgyzstan are required to complete 11 years of primary and secondary schooling. Students then choose a path to pursue after the secondary level of schooling—a university, a technical school, or an institute (Hanks 2005). UNICEF (2013b) found that for the 15–24 age group, there is a 100 percent literacy rate. Attendance at primary school for females is 99 percent and 83 percent for males; 2 percent of primary school children are out of school. The secondary school attendance rate for females is 80 percent and 81 percent for males. In 2008, UNICEF reported that there were 39,000 primary school-age children out of school, and 38.5 percent are girls. Adults have a 99 percent literacy rate (UNICEF 2013b).

Table 1 Perceptions of Individual Well-Being (Percent Satisfied)

Education Quality	Health Care Quality	Standard of Living	Feeling Safe	Freedom of Choice	
2014	2014	2014	2014	2014	2014
				Female	Male
58	57	76	49	70	63

Health

The advancements in health care indicate the health sector was a major benefactor after Kyrgyzstan gained independence, and the quality of life has improved. The under-5 mortality rate (U5MR) for Kyrgyzstan has decreased from 66 in 1990 to 24 in 2013 (UNICEF 2013b). In 2013, the U5MR for males and females was 27 and 24, respectively. Also, life expectancy is 68 years old. Further, it was found that 62 percent of children with symptoms of pneumonia are currently seeking treatment, and only 45 percent of those children are receiving antibiotics (UNICEF 2013b). For children under 5 years old, 17.8 percent suffered from malnutrition (UNDP 2015). Finally, the *Human Development Report* surveyed individuals in Kyrgyzstan on their perceptions of individual well-being (UNDP 2015).

In 2013, on average, women gave birth to three children, and the female-to-male population ratio was 0.97 (WEF 2013b). The maternal mortality ratio is 71 per 100,000 live births, and the infant mortality rate is 1 per 1,000 live births (WEF 2013b). Kyrgyzstan does have legislation that allows for an abortion for the mother's physical health. According to UNICEF (2013b), 97 percent of women attended at least one antenatal visit, and 84 percent attended at least four visits. Further, 99 percent of women stated that they gave birth with a skilled attendant present or at an institution (UNICEF 2013b).

Diseases and Disorders

Causes of death by disease or disorder are diverse in Kyrgyzstan. In 2002, the World Health Organization (WHO) found that of 45,000 deaths, 47 percent were from cardiovascular disease; 17 percent were from communicable, maternal and perinatal, or nutritional deficiencies; 10 percent were from other chronic diseases; 9 percent were from cancer; 7 percent were from chronic respiratory disease; and 1 percent were from diabetes. UNICEF (2013b) provides detailed information about HIV in Kyrgyzstan. UNICEF estimated that a minimum of 7,000

to a maximum of 10,000 people are living with HIV in Kyrgyzstan.

It is estimated that 1,000 females are living with HIV, and for the 15–49 age group, 0.30 percent have HIV (UNICEF 2013a). For the 15- to 49-year-old males, 0.50 percent are living with HIV (2013a). Also, fewer than 0.2 percent of children are living with HIV (UNICEF 2013b). For the ages 15–24, 24 percent of males and 20 percent of females have comprehensive knowledge of HIV (2013b). In reference to safe sex, 75 percent of males said they use condoms, and 1 percent of males and 12 percent of females indicated that they had been tested for diseases in the last six months (2013a).

Employment

During the USSR era, women in Kyrgyzstan were encouraged to work, and while that trend started to disappear after independence, these women work more so than women in other Central Asian countries (Olcott 1997). However, even with women in Kyrgyzstan working more than women in surrounding countries, there is still great inequality and underrepresentation. This section discusses women's employment rates, where women are working, and whether they hold high positions.

In 2013, the unemployment rate for women was 9 percent, and the rate for men was 7 percent (WEF 2013b). On the political empowerment index, Kyrgyzstan ranks 71st out of 136 countries. The female-to-male ratio of Parliament memberships is 0.30, and the female-to-male ratio of holding ministerial positions is 0.12. The World Economic Forum (WEF 2013b) also examined the percentage of women in top management positions—23 percent of firms—and a woman's ability to move up in position. On a seven-point scale, with one as the worst score and seven as the best score, a woman's ability to move vertically in a firm was rated at five.

Kyrgyzstan offers 126 calendar days for maternity leave and will cover 100 percent of pay for 10 days. The remaining 116 days are covered by social security and is 10 times the benchmark rate (WEF 2013b).

Family Life

In 2013, UNICEF collected data from across the world on different aspects of life (2013b). In Kyrgyzstan, it was discovered that there is a belief that beating one's wife is justified, with 50 percent of males and 34 percent of females agreeing. Most women in Kyrgyzstan transition from a household where the father holds all authority to a home with their husband where the new bride has the least power (HRW 2006). Power in the new home is not entirely held by the husband, but also by female in-laws.

When a woman is married, willingly or not, she inherits most of the work in the new home that was initially completed by the mother-in-law. This includes participating in agriculture, maintaining the home, assisting with the family business, and raising children. She will not be paid for completing any of these tasks. Also, Human Rights Watch (HRW 2006) interviewed several women from Kyrgyzstan to understand their relationships with their female in-laws. These women revealed that their mothers-in-law were extremely abusive—psychologically and physically. However, the mother-in-law was not the only one to physically and verbally abuse a new bride. The sisters-in-law of new brides often participated in relentless abuse to increase her sense of powerlessness. New brides often have every aspect of their lives controlled by their female in-laws and husbands (e.g., ability to leave the house, contact with anyone, decisions related to sex and child-rearing, and her daily schedule) (HRW 2006).

Polygyny

Polygyny, allowing a man to have more than one wife, is illegal in Kyrgyzstan; however, it is still a common practice in the country. Men will often have their first marriage recognized by the state, but additional marriages are not registered. These men usually keep their additional marriages secret from their original wives, and most marriages are accompanied by Muslim ceremonies. Since Kyrgyzstan gained independence, polygyny has increased. Of the women who have filed complaints to women's crisis centers, 40 percent described issues associated with polygyny, for example, custody and property rights (HRW 2006).

Domestic Violence

Victim blaming and a normalized view of domestic violence in Kyrgyzstan is what HRW (2006) found during its extensive research in the country. An abused woman

recounts her experience when explaining the situation to her mother:

When I told my mother that he beat me, she told me that this is normal, everyone is beaten. My mother said, "What, you don't think that father beat me?" Because of that I thought I had to just live with it. She said, "Put up with it." She said, "What if you leave and come home, what will our neighbors and relatives say?" (HRW 2006, 22)

Taalaygul Isakunova, who is on the Presidential Council of Women, Family, and Gender Development, states that big politics are the priority, not women. She explains that Kyrgyzstan has made a statement of commitment, but there is no action to protect the victims of domestic violence (HRW 2006).

Domestic violence has a lasting effect on the victims. Many of the women interviewed by HRW (2006) stated symptoms of posttraumatic stress disorder (PTSD): flashbacks of violence, feelings of paranoia, and panic attacks. Domestic violence also affects the children within a family. Many of the interviewees reported that their children experience depression and anxiety because of witnessing the abuse (HRW 2006). Also, a number of respondents reported that their abuser regularly beat the children of the household.

Female victims of domestic violence are reluctant to seek help for multiple reasons. The Organization for Security and Cooperation in Europe (OSCE) shows that the public in Kyrgyzstan has broad disapproval of the police. These victims also believe that turning to the police will not lead to their abuser being prosecuted. Retaliation against women for reporting on their abusers and subsequent stigmatization by the community are prominent fears among victims (HRW 2006). These issues and concerns are further amplified when the female victim is married to a police officer.

Leaving violent relationships is not an easy task for women experiencing abuse. Physical and economic constraints inhibit victims of domestic violence from leaving the marriage. One HRW interviewee stated that her husband and in-laws locked her in a room. Further, when a woman is confined to the home, she may have no financial means to leave the marriage. As mentioned earlier, fear of retaliation also impedes victims of domestic violence from escaping. Keres K., an HRW interviewee, stated, "I suggested a divorce, and he said, 'No, I'd kill you and the children'" (48). And social stigma is another deterrent

of divorce. A woman being part of a failed marriage can result in a community placing shame on the entire family (HRW 2006).

The law in Kyrgyzstan also contributes to the difficulty for an abused woman to divorce her husband. In instances where one party disagrees with the divorce, a judge may enact a three-month period where the couple is instructed to attempt reconciliation. However, many marriages are not registered with the state, and this causes additional difficulty for the woman to claim property, child custody, and alimony (HRW 2006).

Politics

Women's rights groups are currently fighting on several fronts for the women of Kyrgyzstan; however, their progress is inhibited by several entities. At the conclusion of the Tulip Revolution, President Bakiyev was overthrown, and Roza Otunbayeva rose to office. President Otunbayeva served as interim president from July 2010 to December 2011 and is the first woman to accomplish this in Kyrgyzstan. After special elections were held, a new president was elected, and Otunbayeva made a failed attempt to become foreign minister. Otunbayeva's rise and fall in Kyrgyzstan's government demonstrates how precarious it is for a woman in this country, even for one in the highest office.

Women's Rights Organizations

Kyrgyzstan has dozens of active women's rights groups, and most also address domestic violence in some way. Some of these groups use their resources for research, and others provide crisis centers for women. Women's rights groups that offer services usually have outreach efforts, including a 24-hour hotline, psychological counseling, and legal consultations. HRW found that larger cities in Kyrgyzstan typically have shelters for abused women; however, smaller towns have very few, if any, services for these women. Current law conflicts with these women's rights organization when they attempt to provide shelter. Laws regulating these shelters state a maximum of 10 days for free housing for women and their children, while most of these women need housing for several weeks or months (HRW 2006).

Kyrgyzstan gives very little funding to women's rights groups, and thus the majority of organizations dedicated to supporting women are funded by foreign aid. Housing women survivors of abuse also puts the workers in

danger. In 2000, a husband of a sheltered woman physically assaulted Svetlana Sayakbayeva, the head of the Naryn province shelter, for assisting his wife (HRW 2006).

Kyrgyzstan's Law on Domestic Violence

Kyrgyzstan's government is committed to stopping domestic violence, forced marriage, and abductions. Kyrgyzstan ratified international instruments in regard to guaranteeing a woman's right to have equality and live free of violence (HRW 2006). However, even with these progressive laws and protections, Kyrgyzstan is not effectively enforcing these statutes. Kyrgyzstan is obligated by international law to protect women from violence from the state or private actors. However, a number of complex issues associated with domestic violence make it difficult to leave a violent home.

Law enforcement is the central entity that receives the information to respond to and mitigate the effects of domestic violence in Kyrgyzstan. Overall, Kyrgyzstan's government and police forces fail to adequately address domestic violence. In 2003, Kyrgyzstan adopted a progressive law to provide victims of domestic violence with resources; however, this law has not been integrated into the everyday duties of law enforcement. The issue of domestic violence is not one that receives high priority or sympathy from the police or government officials. Police officers view domestic violence as the woman's problem and often discourage the victim from seeking an investigation. Also, when the police are involved, they often encourage the woman to make peace with her abuser, which gives the victim no option for help). At the writing of the HRW (2006) report, there was no official governmental statistic on the scope of domestic violence in Kyrgyzstan.

Religion and Culture

A belief that is often stressed in Kyrgyzstan is *El menen el bolosun*, or "only with people can individuals see themselves as persons" (Ismailova 2007, 573). Parents in rural areas tend to be stricter on religious and cultural practices than parents in urban areas (e.g., birth, marriage). Also, the culture of Kyrgyzstan is very influential in sustaining beliefs of collectivity and hierarchical relationships (e.g., parent-child, teacher-student, old-young) (Ismailova 2007). Even though religion is a major influence on life in Kyrgyzstan, it is mostly the religious elite that sequester women. With the nomadic tribes, women work as equals

beside men because everyone contributes to the family's well-being (Glenn 1996).

Issues

Bride Kidnapping

In Kyrgyzstan, bride kidnapping is a reality that women experience. According to HRW, these kidnappings are not exclusive to certain areas (rural or urban) but take place all across Kyrgyzstan (2006). The vast majority of females taken are younger than 25, and some are minors. There are government officials in Kyrgyzstan who argue that bride kidnapping is "tradition"; however, nongovernment organizations (NGOs) have argued it is not tradition—it is a crime. Sociologists who have examined the history of marriage in Kyrgyzstan state that arranged marriage is tradition, but bride kidnapping is not. Additionally, since Kyrgyzstan gained independence, bride kidnapping has increased (HRW 2006). Approximately 30 percent of all marriages are the result of bride kidnapping, and some estimate in certain areas it may be as much as 80 percent. HRW (2006) interviewed officials from the Office of the Ombudsman, and their statements are below:

[Bride kidnapping] is a tradition, that's why we've received no appeals. If it were by force, then maybe [people would complain]. A senior police officer states, Of course there is kidnapping, without this marriage doesn't happen. A human rights official continues, I am a Kyrgyz man who grew up here and on the one hand I see it as a violation of the woman who then can't marry the man she loves, but also many women are very shy, their behavior is very different, especially in the villages. We advise women not to associate with men. Our girls don't know how to deal with men. When they grow up, they don't know what to do. Some women are grateful [to be kidnapped], otherwise they say they would never have gotten married. If there was not this tradition, then they would never get married and have children, so I also look at it from that angle. I don't support bride abduction myself. (53)

This statement shows how even someone who holds a human rights governmental position has normalized this crime in everyday life. A survey completed in Kyrgyzstan discovered that the most common reason given for bride kidnapping is that the participants regarded it as a "good tradition" (HRW 2006). Further, Handrahan (2004) found

that men wanting to positively express their Kyrgyz identity caused the increase in bride kidnapping following the breakup of the USSR.

Patterns of bride kidnapping show that this crime is more prevalent in villages than in cities, but it still takes place in cities as well. To highlight a few bride-kidnapping cases, Shoiria S, an HRW (2006) interviewee, was kidnapped in Bishkek, the capital of Kyrgyzstan, in 2002. In 1999, a 12-year-old girl was taken. Also, in November of 2005, six girls were kidnapped from the Jalal Abad province in one week (HRW 2006).

Bride kidnapping happens in multiple ways. A young woman is usually taken by force or deception by the intended groom and a group of other men. They transport the woman to the intended groom's home, and she is locked in a room with the male's female relatives. The intended groom's female relatives physically and psychologically coerce the woman to agree to wear the marriage scarf, which is used as a sign of her consent to the marriage. This process can last hours, and, at times, the intended male will sexually assault the woman as a way to force her to agree to the marriage because of shame, which may result in the victim's family disowning her if she does not marry. The victims are often isolated to prevent them from escaping. These types of marriages are not typically registered with the state; however, they are mostly accompanied by a Muslim ceremony and feast. Also, at the ceremony, the confirmation of consent is usually eschewed (HRW 2006).

It is the norm to be married in Kyrgyzstan, and males often feel pressure from their families to marry. Also, with the generational repetition of domestic violence, young boys are taught that this crime is tradition or normal and acceptable. Bride kidnapping is an expression of male dominance (HRW 2006; Handrahan 2004). Handrahan states that kidnapping "reinforces male hegemony, that is, dominance of women" (HRW 2006, 57). Another factor that perpetuates this crime is that men who bride kidnap are not prosecuted in most cases. Women who are kidnapped are often forced by strangers or acquaintances. Feruza F. recounts her experience below:

The men who took me were acquaintances of my father. It was evening, and the men had seen me earlier for a while, and they went to my parents and said they wanted to marry me with someone. My parents said, "No, she's still young." The men ignored that. I was in shock, I had never seen this man before, and I didn't want to marry him. I didn't like it, and I said, "I don't want to live with

you, and I don't know you." They said, "No, this is the way with all women. Everything will be normal." I didn't like the man they made me marry. (HRW 2006, 59)

Even though there is a massive amount of evidence that strangers and acquaintances commit these crimes, law enforcement officials who spoke to HRW deny who carries out the abductions. In cases where the men are not acquaintances, physical force is used to kidnap the woman. When there is a previous relationship between the abductors and the victim, deception is more common (HRW 2006).

These kidnappings have a significant emotional and physical impact on the victims. Many victims have the trauma of being kidnapped compounded with domestic violence. This trauma is only amplified when examining how the legal system handles bride kidnapping. "Article 155 of the Criminal Code outlaws non-consensual marriage by abduction. It states, 'Forcing a woman to marry or to continue a marriage or kidnapping her to marry without her consent' will be punished by law" (HRW 2006, 72). The punishment is up to five years in prison or a fine of 100 to 200 times the monthly minimum wage (HRW 2006). The minimum wage in 2005 was approximately 100 som, or USD\$2.42.

This statute is not entirely clear on what will happen if it is violated. Also, under this law, a man could kidnap a woman, rape her, and throw her on the streets and just receive a fine, which some women's rights advocates and sociologist Medina Aitieva agree is not adequate punishment. HRW interviewed police officers on the matter of bride kidnapping and discovered the attitudes that NGOs say are "typical." While speaking to officers about the kidnappings, they would laugh, and one joked that the HRW researcher could be kidnapped while in Kyrgyzstan (HRW 2006). These attitudes do not support the victims.

A nongovernmental activist states, "I've never heard of a criminal case being opened related to a kidnapping." Further, Medina Aitieva states,

I've never heard of a case where a woman sued for kidnapping as a crime if she was returned home. In one case, a family sued a man for kidnapping because the families had no connection to one another. There was financial compensation for the family but no jail time for the kidnappers. There are almost no legal cases. Even the case in the film [by Petr Lom] where the girl died, that case hasn't gone anywhere. It was too hard to prove. No autopsy was done. The other side [the abductor's family] said it was suicide. (HRW 2006, 73–74)

LGBT Issues

Same-sex activity between two men or two women is legal in Kyrgyzstan. However, same-sex couples face obstacles that their straight counterparts do not. In 1998, Kyrgyzstan ratified same-sex sexual relations and equal age of consent. However, LGBT citizens are not completely or equally protected by social or legal standards similar to their heterosexual counterparts. Same-sex couples cannot marry and therefore do not have any legal relationship benefits from such declarations. Also, LGBT couples cannot adopt children. Finally, there is no hate crime legislation in Kyrgyzstan that protects individuals on the bases of sexual orientation or gender identity (Itaborahy and Zhu 2013).

Being out as LGBT in Kyrgyzstan is not only incompatible with the country's norms, but it also may lead to life-threatening situations. LGBT individuals attempt to remain unidentified because of several negative outcomes: termination from one's job, physical and verbal abuse, and disownment by one's family (Wilkinson and Kirey 2010). LGBT individuals who do not have financial dependency or social group support are at extremely high risk of being "outed" (Plus 2007).

HRW (2008a) found that the LGBT community in Kyrgyzstan is subjected to unprovoked physical and verbal attacks based on mannerisms and appearances. Attempting to positively express one's nonheterosexual identity is seen as undesirable and shameful in Kyrgyzstan. This attitude is shown by the following question a university professor asked a lesbian student: "We don't put you in jail; we don't beat you; what more do you want?" (HRW 2008b, 29). When LGBT individuals fail to conform to the heteronormative expectations of Kyrgyzstan, this is used to legitimize a punishment of physical beating or rape for their "immoral behavior" (Wilkinson and Kirey 2010).

The victimization of LGBT individuals is compounded by the fact that law enforcement often perpetuates the violent attack (Van der Veur 2004; HRW 2008b). Additionally, the families of LGBT individuals often try to force marriage of the opposite sex on these persons as an attempt to "cure" them (HRW 2008b; Kyrgyzlabrys 2007b). Governmental officials state that LGBT individuals are protected as much as their heterosexual counterparts (Kyrgyzlabrys 2007a). However, these same officials do not recognize the violent and discriminatory milieu the LGBT community faces in everyday life. Van der Veur (2004) states that Kyrgyzstan is for human rights, but not for homosexuals. The

following daily routine is recounted to show how LGBT individuals censor their daily self for Kyrgyzstan society:

For example, when we eat out sometimes . . . we must not show who we are. And this is how we live. . . . We must pretend that we are not like “them” [e.g., lesbians], we must be reserved, although we just want to be free. On the streets, among other people, we are not free. We can only be free at Labrys or at home, or in our clubs. So I think it is very hard. And even when we walk down the street holding hands . . . , sometimes we get shouts of “shameless” and similar things. (Wilkinson and Kirey 2010, 489)

Further, a trans man who works for Labrys remarked on the advancement of LGBT rights in Kyrgyzstan, “No one will give you right, you have to go and take you[r] right” (Wilkinson and Kirey 2010, 490).

Labrys is an NGO in Kyrgyzstan that advocates for the rights of LGBT individuals in the country. It was founded in 2004 after the owner of a café threw out a group of mostly LGBT women. The owner stated the group was removed because two women were seen kissing. The group would have sought legal action; however, the prospect of being “outed” inhibited their action (Wilkinson and Kirey 2010). These events inspired this organization to be formed to protect individuals in the LGBT community.

Labrys operates as a starting point for exploring and conversing about the lives of the LGBT community (Wilkinson and Kirey 2010). Compared to Kyrgyzstan’s neighbors, the opportunities for the LGBT community to be recognized is greater. However, this progression is due in large part to international donors and the influence they hold in the Kyrgyzstan government (Kirmse 2009; Paasiaro 2009).

LGBT citizens of Kyrgyzstan face numerous dangers in everyday life, but these dangers are exacerbated when law enforcement officers are the perpetrators. Fathullo F., a gay man, told HRW (2014) about his encounter with the police. He had arrived at a destination to meet another man, and police officers arrested him. Once he was at the police station, officers beat him until he agreed to write a confession about seeking another male. These officers threatened to charge Fathullo F. with criminal sodomy—even though sex between two men is not illegal—if he did not give the officers money and the names of other gay men. Fathullo F. recalls what the officers said to him during this process:

The officers told me that people like me do not deserve to [be] on [the] face of the earth. I asked them to let

me sit down because I was tired. They said that I didn’t deserve to use their chair and spat on me. They said that I didn’t deserve to live and threatened to ruin me if I didn’t give them 10,000 soms [USD\$214]. (HRW 2014)

Social conservatism makes gay and bisexual males easy targets for extortion, violence, and blackmail. Several of HRW’s gay male interviewees, one being 17 years old at the time of abuse, stated that police officers threatened to rape them. It was not uncommon for the officers to say they would complete the rape with inanimate objects (HRW 2014). Additionally, many men reported rape or the threat of rape by police officers.

Kyrgyzstan’s laws not only prohibit detaining an individual because of their sexual orientation but also explicitly outlaw torture and ill treatment by the police (HRW 2014). The interviewees of HRW (2014) stated that they do not feel secure in reporting these events and have an extreme lack of confidence in the legal system.

Laos

Overview of Country

Lao People's Democratic Republic—Laos or Lao PDR—is located in Southeast Asia and borders Thailand, Vietnam, Burma, Cambodia, and China. It is completely landlocked. The estimated population is 6,894,000 people. Among the 49 official ethnic groups, the Lao Lum represent the majority, having the greatest socioeconomic status and political power. This is followed by the Khmu and the Hmong groups. Laos is the 84th-largest country in the world. Its total area is 91,429 square miles. Only 2.5 percent of that area consists of water. Most of its landscape (90%) is rugged mountains and the rest plains and plateaus. The Mekong River, the main river of the country, is the 12th-longest in the world at 2,700 miles; it forms part of the border with Thailand. The country's climate is tropical monsoon, and the rainy season occurs from May to November.

The constitution of Laos as a country started in the 14th century with the proclamation of the Kingdom of Lang Lao—or Kingdom of the Million Elephants. The kingdom lasted until the 18th century, when it was invaded by Siam (now Thailand). With the expansion of European colonization in Africa and Asia, France conquered the region in 1893, and Laos became part of French Indochina. During World War II (between 1940 and 1945), the Japanese invaded and controlled the region. However, when they

lost the war, the country went back to French domination. At that time, Laos tried to become independent but faced resistance by France, obtaining its independence only in 1954, when it became a constitutional monarchy known as Pathet Lao (Lao State). Subsequently, it became a member of the United Nations.

Amid the Cold War and following French domination, the United States and the Soviet Union started to gain influence in the region. While the Soviet Union supported the Pathet Lao, which was a communist political movement, the United States supported right-wing groups against the government. The result was a civil war between leftist, neutralist, and rightist groups that culminated with the leftist (communist) victory and the establishment of the Lao People's Democratic Republic in December of 1975.

The capital of the country and biggest city is Vientiane, where 946,000 Laotians live. Only 34.7 percent of the population live in urban areas, which means the vast majority reside in rural areas. Lao is the official language, but French is also spoken in government, commerce, and schools. In addition, the many different ethnic groups that are part of the country have their own languages and dialects. Theravada Buddhism is the official religion, which is deeply embedded in the culture. Kip is the official currency.

There are many reasons why Laos holds the rank of the least-developed country in the world. To start, unexploded bombs from the previous years of war can still be found and threaten the lives of Laotians; children represent 58

percent of casualties (UNICEF 2013b). In addition, the country lacks an efficient transportation system. There are no railroads, and the Mekong River is the main means of transportation for agriculture products to get from the rural to urban areas. This causes many issues, considering that 80 percent of the population works with agriculture. Using the river is riskier and longer. In addition, because the country is landlocked, air transportation is required. The roads' extension over the country is the equivalent to 20,300 miles, many of which are not paved. Another factor is that many places within the country do not have basic infrastructure systems, such as schools, sewage, and clean water, increasing the chances of infectious diseases. The communication system is also lacking; in 2005, for example, there were about 20,000 Internet users.

In the late 1980s, the government initiated a decentralization of the economy, opening it to private companies and foreign investment, which resulted in economic growth. However, subsistence agriculture is still the economic activity that employs the most people in Laos, both men and women. Rice is the main cultivated product; others include corn, pineapple, potatoes, and cassava. Livestock is also important. The few industries in the country are restricted to small consumer goods factories. More women run businesses than men (63% of business owners were women in 2010), both in private and informal sectors. However, few women hold managerial positions (11% hold senior management positions), and the gender gap is still considerable: when they are managers, women receive half the salary men earn.

Gender inequality is an important factor in the country. In 2014, the UN Development Programme (UNDP) ranked Lao People's Democratic Republic 141th out of 188 nations, based on the Human Development Index (HDI, 0.575) (UNDP 2015). The UNDP did not find relevant data to measure the Gender Inequality Index (GII) for Laos. According to the Gender Gap Index 2015, measured by the World Economic Forum (WEF), Laos's score was 0.713 (the closer to 1.0, the closer to equality), putting the country at 52nd out of 145 countries. However, taking into consideration the other measurement—the gender gap presented above—and the literature review, it is clear that gender inequality is still a problem. Poverty affects both men and women and plays an important role in Laotians' lives. Almost one-third of the population lives in poverty, and another one-third lives in severe conditions of poverty or near poverty, resulting in 67.6 percent of the population facing poverty daily.

Girls and Teens

Laos's population is very young: almost 60 percent of its population is under 25 years old, and 34.7 percent is under 14 years old. In general, Laos's society has almost the same number of men and women (CIA 2015). In many cases, there is no gender difference among boys and girls, especially when related to health problems, such as the risk of infectious diseases and malnutrition, and economic issues, such as child labor. In 2006, 11 percent of boys and girls 5–14 years old were victims of child labor (CIA 2015). Of children under 5 years old, 29.3 percent suffered from malnutrition between 2008 and 2012 in rural areas, while 16.1 percent presented malnutrition conditions in urban areas (UNICEF 2013). The infant mortality ratio is 52.97 deaths per 1,000 births—the 32nd-highest rate among 224 countries (CIA 2015).

The differences among girls and boys are highlighted when culture is considered. From a young age, girls are expected to help with domestic chores and develop traits associated with femininity, such as cooking. Their double work journey—in the house and helping with farming—results in fewer school opportunities for them. While on average boys spend 6.1 years in school, girls spend only 3.9 on average (UNDP 2015). The literacy rate for female youth (15–22 years old) is 78.7 percent, compared to 89.2 percent for males (UNICEF 2013). However, when these numbers are broken down by ethnicity, the gender gap is bigger, showing that women in ethnic minority groups are more disadvantaged in Laos's society.

Teen Pregnancy

One of the main problems for girls in Laos is teen pregnancy. Especially in the most remote villages, where access to education and jobs is restricted, many girls see marriage as their only option, and they get married at early ages. Although the legal marriage age for girls is 18 years old, 24.7 percent of girls were married before the age of 18 in 2006 (UNGEI 2016). Parents usually do not oppose early marriage because getting married young is culturally accepted and seen as normal. In 2013, 1 out of 10 girls between 15 and 19 years old gave birth (UNFPA 2013). In rural areas, some cultural practices (such as giving birth in the wild) and the lack of access to health care pose great threats to the lives of both mother and child. The country presents a high maternal mortality rate, 197 deaths per 100,000 live births, the 21st highest in the world (CIA 2016). Education is seen as a way to avoid teen pregnancy

among Laotian girls because it is a powerful tool that could bring different possibilities of jobs. However, many girls leave school after the primary years, as secondary education is not compulsory. While 96.4 percent of girls are enrolled in primary school, only 38.7 are enrolled in secondary school.

Sex Trafficking

According to the 2015 U.S. State Department report on human trafficking, Laos is classified in the Tier 2 category, which means that despite the efforts of the government, progress has not been made in the fight against human trafficking. In addition, the implementation of programs is slow or relies on the efforts of international agencies. A report from 2011 indicated that almost 100 percent of the victims were women and that 82 percent of all the victims were children (UNODC 2012). Many Laotian girls are victims of sex trafficking. Their main destination is Thailand, where around 90 percent are forced to work as prostitutes (Kimmons 2014). A lack of education and poverty are the two main factors that result in this situation.

Education

The Ministry of Education is responsible for the educational system of the country at a national level, including primary school (grades 1–5), which is tuition-free, compulsory, and the only one guaranteed by the constitution; lower secondary school (grades 6–8), which is tuition-free but not compulsory; upper secondary school (grades 9–11), which is tuition-free but not compulsory; and post-secondary school, which is tuition-based and not compulsory. Educational planning and policy making are part of its responsibilities. In some cases, this centralization resulted in a poor integration with local diversity, which is problematic considering the many ethnic groups in the country. Therefore, in March 2000, a deconcentration decree was signed, allowing more autonomy to the provinces. The Ministry of Education works together with the Provincial Education Services, District Education Bureaus, and the Village Education Development Committees. The government allows the creation of private schools, as long as they follow the curriculum developed by the Ministry of Education.

The focus on education has been part of many initiatives and debates about policies because it is seen as a means for the country to overcome its position as the

least-developed country in the world. Economic disparity is an important factor when analyzing education, as most of the population living in the rural areas is poorer when compared to the people living in urbanized cities. In 2010, 2.8 percent of the gross domestic product (GDP) was spent on education (CIA 2016). To reduce these disparities, a partnership between the Basic Education for Girls Project (BEGP), funded by the Asian Development Bank (ADB), and the Ministry of Education between 2001 and 2007 resulted in the construction of 512 schools in rural areas with water supplies and sanitation facilities. In many instances, these schools were the first buildings with this infrastructure in the villages. In addition, in 2009, the government, in partnership with the Global Partnership for Education, developed the Education Sector Development Plan (ESDP) between 2010 and 2015 to improve the quality of the educational system and to reduce the number of dropouts, supporting the completion of all educational levels, especially from the rural ethnic minorities groups, during the period of 2010–2015.

Among the many problems faced by Laos's schools, the lack of meals for students was significant. Many of the children suffered from malnutrition, significantly decreasing their performance at school. Therefore, the School Meals Program was created. To solve the meal problem in the schools, a sustainability chain was developed with the local food producers, who provided food to the schools. This initiative also promotes the active involvement of the community in the school, not only helping to solve the nutrition problem of the children but also promoting self-reliance and strengthening the community. In general, the government has been investing more in education. This partnership has been renewed, and the new ESDP 2016–2020 focuses on expanding secondary education as compulsory, eradicating illiteracy among all ethnic groups, and improving teacher training, among other goals.

Primary and Secondary Education

The goals of primary education are to develop good citizens that understand and respect their ethnic backgrounds and to provide them with basic knowledge and skills to keep studying after completing their primary education. Although primary school is a requirement, many children still face difficulties accessing it. Mainly in rural areas, the distance to the school is a key factor that still impacts attendance rates; usually, people living in the mountains are the most affected because they either do not have

schools at all or, when they do, it is usually incomplete; that is, the school might not offer the full primary education or have multigrade classes. By 2001, only 70 percent of the 11,640 existing villages in Laos had a partial school (only primary education). Among these, the majority were incomplete, providing only the first two or three grades out of the five.

Children should start the first year of primary education by the age of 6; however, most start at 9 or 10. The school progression is usually very slow. On average, it takes 10 years to complete primary education due to the high rates of repetition and dropout. Besides the lack of schools and infrastructure, the high dropout rates are a big problem. The survival rate to the last primary grade is only 68 percent (UNICEF 2013). When gender and ethnicity are considered, the result is the minority group most affected by the lack of formal education: girls in ethnic minorities (among the poorest groups of the country) experience higher rates of dropping out. The percentage of girls who are out of school in primary age is 64 percent, compared to 36 percent for boys (World Economic Forum 2015).

The gender gap does not stop at the primary educational level: the gross enrollment ratio for secondary education is 48.6 percent for boys, compared to 42.9 percent for girls. In general, the numbers are concerning because only 45.9 percent of boys and girls are enrolled in secondary education (Ministry of Education 2015). As stated before, secondary education is not compulsory, but it is during this period that students are expected to enhance their general and vocational knowledge and skills. After completing the lower secondary education, students have three options: continue to upper secondary education, enter the workforce with basic skills, or enroll in a teacher training course that lasts three years and allows them to teach in primary and lower secondary education. After completing secondary education, students may have better chances to join the workforce in better-paid positions, go to the university, or attend a teacher training course to teach in both primary and secondary education.

Students in Laos also demonstrate high rates of dropping out of secondary education. The main reasons are economic and infrastructural. While many families lack resources and need the children to work from very young ages to have better incomes, and many girls end up getting married in early ages and become mothers as a solution to their economic situation, the schools are very sparsely distributed in the rural areas. This makes the schools difficult to access. Following the same pattern of primary

education, girls from ethnic minorities have lower enrollments because they are expected to assume responsibilities of the household, from taking care of younger siblings to assisting in the domestic agricultural production. In addition, the difficulties imposed by the low number of secondary schools also impact girls' enrollment because parents tend to be more reluctant to allow them to walk or travel longer distances to get to school because they are likely to be abused.

Lao PDR's government also offers technical and vocational education. Students who graduate from primary education have the option to attend a four-year vocational program administered by the Ministry of Information and Culture, and students who graduate lower secondary school can enroll in a three-year vocational program, which may be administered by the Ministries of Education, Finance, Health, or others. In 2005–2006, there were only 12 vocational training institutions in the whole country, with 2,585 students enrolled. Of these, only 34.8 percent were girls (UNESCO-IBE 2011). Technical education is provided to students who graduated from lower secondary education. The programs are offered by 17 institutions, and their duration is three or four years. In 2005–2006, the number of students enrolled was 10,219, and of these, 33.3 percent were girls.

Postsecondary Education

Postsecondary education is offered in public and private institutions; however, the number of institutions is small. The main public university is the National University of Laos (NUOL). In general, different types of diplomas are offered in academic, professional, and technological programs. According to the last educational census, from 2014 to 2015, there were 42,723 students enrolled in a bachelor's degree program (42.9% of women), 1,244 enrolled in a master's degree program, and 22 in a PhD program (36.9 percent and 40.9 percent are women, respectively) (Ministry of Education 2015). By analyzing the data, it is possible to see that women are a minority at all levels; however, when it comes to the area of study, the disparity increases greatly. In STEM fields (science, technology, engineering, and mathematics), women represent only 20 percent of enrolled students.

Teaching Staff and Methodology

The requirements to become a teacher vary according to the level being taught. To become a primary teacher, there

are three possibilities: finish primary school and take a four-year teacher education and training course, complete lower secondary education and take a three-year teacher education and training course, or complete the whole secondary education and take a one-year teacher education and training course. Secondary school teachers must complete secondary education and take a three-year teacher training course for lower secondary and a four- to five-year teacher training course for upper secondary. Women are the majority of the teachers in preprimary, primary, and secondary levels: 98.4 percent, 51.2 percent, and 50.3 percent, respectively. However, the situation changes at the postsecondary level. Out of the 6,723 teachers, administrators, and staff working in the public sector, only 2,831 are women (42.1%), and of the 1,989 teachers, administrators, and staff working in the private sector, 764 are women (38.4%) (Ministry of Education 2015). Salaries are low, varying from USD\$39 to USD\$45 per month in primary and lower secondary education, respectively (UNESCO-IBE 2011).

In general, the methodology used by teachers is based on lectures, and there is little time allocated to applying the knowledge obtained from these lectures. Students are then passive recipients and not active learners, making it more difficult to develop critical and applicable thinking. The classroom also reproduces general social traditions. For example, boys and girls usually sit in different rows and do not share tables or benches, reinforcing cultural traditions that men and women should sit and work apart.

Health

The Laos government has been significantly investing in health as part of the established measures to alleviate poverty and overcome its position as the least-developed country in the world by 2020. The expenditure on health in 2013 was 2 percent of the GDP. From 2005 to 2015, health indicators showed major changes. For example, life expectancy increased from 59 to 64 years old for men and from 63 to 67 years old for women (WHO 2016b). The maternal mortality rate also decreased significantly, from 405 deaths per 100,000 live births in 2005 to 197 deaths per 100,000 live births in 2015. The infant mortality rate has fallen from 104 deaths to 52.97 per 1,000 live births between the same period (CIA 2015). Some of the ongoing health problems in the country are related to the lack of access to clean water and basic sanitation. Most of the population still lives in rural areas, where the geography

may cause barriers to access and transportation. Among these health problems are malaria, dysentery, hepatitis A, parasitic diseases, and respiratory infections. Child polio was eradicated in the country in 2000.

Regarding the use of tobacco, since 2014, the government's efforts to control it have increased. Some public places, such as schools and public transportation, are smoke-free. In addition, health warnings are mandatory on cigarette boxes, and advertisement is banned on national television, radio, and print media. On the other hand, the taxation of the product is low (less than 25% of retail price), and there are no treatments for tobacco dependence. In general, men are the major users: 65 percent of men smoke tobacco, compared to 11.5 percent of women. Among the youth (13–15 years old), boys also use tobacco more than girls (18.7% of boys and 6% of girls) (WHO 2015). In terms of alcohol consumption, men also consume more than women—20.9 liters per year for men and 6.2 for women—and 5 percent of the male population is alcohol dependent, compared to 0.7 percent of the female population. Alcohol consumption is the main cause of liver cirrhosis in 72.6 percent of the male population and 51.2 percent of the female population. In addition, it is responsible for 26.3 percent of road accidents involving men and 5.4 percent involving women (WHO 2014). Regulations related to alcohol consumption are less strict. The on-site sale of alcohol is restricted to people over 18 years old, but off-premise sales have no restrictions. In addition, alcohol can be sold without time and day restrictions.

Access to Health Care

Health care is not guaranteed in Laos's Constitution; however, the government has been working to provide public health services to populations in every village. Access and instructions about the use of clean and sanitized water are part of the main efforts the government has taken to control and avoid transmittable diseases, such as dengue, diarrhea, and malaria. The rural population suffers more from these diseases than the urban population due to the lack of infrastructure. While 94.5 percent of the urban population has access to improved sanitation facilities, and 85.6 percent have improved access to a drinking-water source, these numbers are considerably lower for the rural population. In rural areas, only 56 percent have access to improved sanitation facilities, and 69.4 percent have improved access to an improved drinking-water source (CIA 2016).

Health services have been provided by public and private initiatives since 2001. The government controls more than 870 public health services, and the private sector is responsible for 1,332 private clinics. The country also produces its own medicine; the six government factories produce around 880 types of drugs, supporting 48 percent of the country's demand. There are 1,992 private pharmacies (United Nations 2011). In 2012, there were 0.18 physicians per 1,000 population and 1.5 hospital beds per 1,000 population (CIA 2015).

Maternal Health

By 2030, Laos's population is projected to increase by 33 percent. It is estimated that 308,000 pregnancies occur every year, and the fertility rate of the country is 3 children per woman. Most of the pregnant women live in rural areas, as that is where most of population is located; therefore, the risks are higher due to the infrastructural problems faced by those living in rural conditions. However, maternal health still needs to be improved. To start, the actual workforce available—midwives or birth attendants—to take care of pregnant women (from pre-pregnancy to postnatal) is estimated to meet only 19 percent of the demand (UNFPA 2014). In 2005, only 18.5 percent of the births were attended by skilled health professionals.

When considering the economic status of the population, the difference becomes drastic: between 2008 and 2012, 90.7 percent of the richest population had skilled attendants at birth compared to only 10.8 percent of the poorest. In this same period, 54.2 percent of pregnant women had at least one antenatal care visit, and 36.9 percent had at least four visits. In the same period, 3.7 percent of babies were delivered by cesarean section. Although working mothers are allowed to have paid breaks during work hours to breastfeed their babies for six months, in 2006, 26.4 percent of infants were exclusively breastfed during the first six months of life (WHO 2013).

The law guarantees less than 14 weeks of paid leave for mothers of infants. In addition, the number of women of reproductive age (15–49 years old), married or in union, was 49.8 percent in 2011–2012 (CIA 2015). This number reveals that many women still do not have access to contraceptive methods. On the other hand, Laos was able to eliminate maternal and neonatal tetanus in 2014 with the support of UNICEF. Also in 2014, this same partnership implemented a national immunization campaign against measles and rubella, targeting children between 9 months

old and 10 years old. This campaign successfully immunized 1.66 million children.

Diseases and Disorders

Laos is considered a country with low prevalence of HIV/AIDS. In 2014, the adult prevalence rate was at 0.26 percent; there were 11,100 people living with HIV/AIDS, and 500 people died because of it (CIA 2015). Even among women in the sex industry, which is considered a high-risk group, the incidence rate was low (0.9% in 2000–2001); however, the incidence of other sexually transmitted diseases (STDs) is considerably higher, such as chlamydia (32%) and gonorrhea (14%). The majority of the cases are a result of heterosexual intercourse; however, the incidence of HIV/AIDS among men having sex with other men was 5.6 percent in 2007 in the capital of Vientiane. Most of the infected population is male and 20–40 years old. Between 1990 (the year of the first registered incident) and 2003, the transmission of the disease by drug injection was the same as the rates related to acupuncture (0.09%). This is compatible with the fact that although high school students learn about HIV/AIDS at school, the modes of transmission are not very clear, resulting in some confusion about it (such as whether it can be transmitted by a mosquito bite or by sharing the same toilet). One of the problems is that the use of condoms is not widespread among the Laotian population.

The diseases that most affect the population are related to water and sanitation. Dengue is one of the main concerns, as 1.8 billion of the people at risk globally live in the Asia-Pacific region, where Laos is located. With the Zika virus (which is transmitted by the same mosquito as dengue, called *Aedes*), the efforts to control the situation have been improved. In 2013, the country registered the worst dengue epidemic, with 44,171 cases and 95 deaths (WHO 2016a). The rate for malaria incidence was 369.35 per 100,000 people in 2010, with a mortality rate of 0.39 per 100,000 people. Other diseases, such as tuberculosis (TB), also affect the population. It was estimated in 2011 that there were 213 cases per 100,000 people, which resulted in 11 deaths (WHO 2013). High blood pressure affects men (39.7%) slightly more than women (35.1%).

Employment

Labor rights are very limited. On one hand, the minimum wage is defined by law, and on the other hand, unemployed

people do not receive any assistance from the government. The constitution does not guarantee equal pay by gender, nor does it protect against discrimination in the workplace. Workers cannot work more than 48 hours per week, and they are allowed to have one day of rest. Workers are allowed to have 15–19 days of paid annual leave, and no sick leaves are allowed. In addition, trade unions are not allowed to be formed in Laos, violating the right to freedom of association for workers—the only unions allowed must be affiliated with the ruling party, Lao People's Revolution Party, and follow their ideology. Strikes are also prohibited by law.

Most women in Laos live and work in rural areas. The work they develop in agriculture is often seen as part of their domestic responsibilities, and unpaid in some cases. When it comes to small enterprises, more than half of women are owners or operators, but this is not the case in medium and big enterprises. In general, women are half of the labor force of the country.

Family Life

Living in rural and remote areas, many boys and girls do not see any other option regarding education and work in their lives, so they end up getting married early. Although by law the legal marriage age is 18 years old, it is common to see women, especially, married before this age and having children. The average age for marriage, though, is 22 for women and 25 for men. Women are not only responsible for child care and household duties, but they also generally work outside the house. The constitution provides equal rights for both men and women after marriage; that is, women can keep their assets if they were acquired prior to marriage.

In the north of the country, families live in a patrilineal system, in which the home and land of the family is passed to the sons when they get married. However, in the south, the system is matrilineal, meaning that daughters receive their family's property when they get married. However, this does not change women's matrimonial obligations. Regarding reproductive rights, the choice of quantity and timing of children is guaranteed to be a decision made only by the couple or individuals. Abortion is allowed only in cases where there is a risk to the woman's life. Not having children results in many social stigmas. Divorce is allowed, but it is very rare.

Although the country remains communist, having a centralized economy and politics, it has opened up to

the private sector and international initiatives. Among the most problematic factors for doing business in Laos are the following: the workforce is not properly educated, which is consistent with the educational problems that still exist in the country; lack of access to financing; and lack of infrastructure. This reinforces the existing systemic problems in Laos's society: without infrastructure, many people cannot attend school due to lack of transportation or even because there are not schools in every village. It is hard to have a skilled workforce and establish more businesses under these circumstances.

Politics

Laos is one of the remaining communist countries with one political party: the Lao People's Revolution Party (LPRP). Any other party is illegal. The 132 members of the National Assembly are elected every five years. With universal suffrage, any adult can vote. The government restricts the rights of freedom of speech, association, and assembly, and it controls the newspapers, television, and radio. Also, since 2014, the Internet has limitations regarding the type of information that can be shared. Many social activists critical of the government have been arrested, detained, and have even disappeared. Women are minorities in politics, and according to the 2015 Gender Gap Index, it is the area with more inequality among men and women.

After the election of 2011, there were 33 women in the National Assembly (25% of all seats), and 2 were ministers in the prime minister's office, 1 was the minister of labor and social welfare, and 5 were members of the LPRP Central Committee. Women constituted less than 3 percent of village chiefs, even though the vast majority of the population live in rural areas. The Lao PDR Women's Union (LWU) is the mass organization from the government that focuses on women's issues and has a presence in every village and at every government level. The number of ethnic minorities is higher: there are 7 members in the LPRP Central Committee and 50 members in the National Assembly.

According to the constitution, rape is a crime, and the punishment is between three to five years in prison. If the victim is under the age of 18, died, or is seriously injured, the sentence may be longer. However, there are no crime statistics and no central crime database provided by the government. Domestic violence is also illegal, but it is almost never reported due to the social stigma related to it. Equal rights are provided to women through the

constitution; however, socioeconomic status, gender stereotyping, and ethnicity can impact women's lives, making it harder for them to access education and find jobs and business opportunities.

Religious and Cultural Roles

People in Laos are allowed to believe or not believe in religion. There is no official religion recognized by the state, but the majority of the population is Buddhist. However, the government also officially recognizes three more groups: Christianity, Islam, and the Baha'i faith. Especially at the provincial level, there is some discrimination against non-Buddhist individuals.

Culturally, women have secondary roles. They have more responsibilities (household, work, and children) and, therefore, less time to socialize with other people. Women's roles are also reinforced by Buddhism, in which a woman can achieve nirvana, but only after she is reborn as man. Women are not even the spiritual leaders within their households. Buddhist nuns live a contemplative and ascetic life, similar to monks; however, they are not allowed to lead religious ceremonies, as the monks do. Usually, women are responsible for preparing and taking food for the monks in the village, and because they cannot have possessions, they rely on other people to provide them with food and clothing.

Issues

LGBT Community

The first LGBT Pride event occurred in June 2012. More than 100 people attended the event, which was organized by young activists who employed different tactics, such as dance and drama, to raise the issues faced by members of the LGBT community, including discrimination and sexual health. Although homosexuality is not a crime in Laos, the constitution does not address LGBT rights and includes no prohibition of discrimination against LGBT people. In general, lesbians encounter more discrimination than gay men (U.S. Department of State 2013).

M

Malaysia

Overview of Country

Malaysia is located in Southeast Asia. Kuala Lumpur is the capital. The country is a federal constitutional monarchy, consisting of 13 states and 3 federal territories (Nations Online 2016). It is 127,720 square miles (330,803 sq. km). The southern city of Putrajaya is the federal administrative center. The South China Sea, which goes into Peninsular Malaysia and East Malaysia, separates the country (CIA 2016). Peninsular Malaysia shares land and maritime borders with Thailand, Singapore, Vietnam, and Indonesia. East Malaysia shares land and maritime borders with Brunei, Indonesia, the Philippines, and Vietnam (CIA 2016). As of 2013, the population was roughly 29,716,000 (UNICEF 2015a).

Malaysia was a British colony until 1942, when it was occupied by the Imperial Japanese Army for three years (CIA 2016). In 1948, the British-ruled territories on the Malay Peninsula, except Singapore, established the Federation of Malaya; it became independent in 1957. Malaysia came into being in 1963, when Singapore, North Borneo, and Sarawak joined the federation (CIA 2016). During the first several years of the independence, the federation faced a communist insurgency, confrontations with Indonesia, annexation by the Philippines, and Singapore's withdrawal in 1965 (CIA 2016).

Malaysia is a multiethnic and multicultural country. Based on the 2010 census, 91.8 percent of the population are Malaysian citizens, and 8.2 percent are noncitizens (Department of Statistics 2010; CIA 2016). Malaysian citizens are divided among different ethnic groups: Malays constitute 50.1 percent, Chinese 24.6 percent, Indians 7.3 percent, and others 0.7 percent (Department of Statistics 2010). The constitution defines Malays as Muslims and declares Islam as the state religion. But non-Muslims have religious freedoms. The 2010 census shows that among specified religions, 61.3 percent of Malaysians are Muslims; 19.8 percent are Buddhists; 9.2 percent are Christians; 6.3 percent are Hindu; 1.3 percent practice Confucianism, Taoism, or other traditional Chinese religions; 0.4 percent are other groups; and 0.8 percent have no religion (CIA 2016).

Multiple languages are spoken in this country. The official language is Bahasa Malaysia; other languages include English; various Chinese dialects (Cantonese, Mandarin, Hokkien, Hakka, Hainan, and Foochow); Tamil; Telugu; Malayalam; Panjabi; and Thai (Gale Virtual Reference Library 2013; CIA 2016). Several indigenous languages are spoken in East Malaysia, and Iban and Kadazan are the most widely spoken (CIA 2016).

In 2014, the UN Development Programme (2014) ranked Malaysia 42nd out of 188 nations based on its Gender Inequality Index (GII) of 0.209. This ranking places Malaysia in the second tier of "high human development." The GII consists of three aspects of human development:

reproductive health, empowerment, and economic status. As it measures the human development costs resulting from gender inequality, the lower the GII value, the fewer disparities between females and males and the less loss to human development. Thus, the 42nd ranking indicates a gender inequality issue exists in Malaysia, but it does not seem to be problematic overall.

Girls and Teens

There were 5,533,000 adolescents aged 10–19 years old, according to 2013 UNICEF data (2015a). Six percent of the females were married or in a union, compared to 5 percent of males (UNICEF 2015a). Based on information from an intercultural program, most boys and girls do not touch when they greet due to religion and other factors. However, boys and girls are usually not separated from attending the same classes unless required by teachers or if they attend single-sex Islamic schools, according to the Youth for Understanding U.S.A. (YFU 2017)

Family customs in Malaysia vary depending on traditions of ethnic or religious affiliations; however, Malaysian parents allow boys to participate in activities outside the home (YES Program n.d.). Traditional families tend to believe girls should assume the role of homemaking when they marry; in urban areas, however, this view is less prevalent due to the culture of protectiveness (YES Program n.d.).

There are no apparent gender differences in literacy rates due in part to all students having equal access to education (Gale Virtual Reference Library 2013). UNICEF (2015a) data reveals the youth (ages 15–24) literacy rate between 2009 and 2013 was the same for males and females (98%).

The topic of sexuality in Malaysia is taboo. A study by Talib et al. (2012) examined 380 university students who reflected on their sex education in high school. Nearly 90 percent of the respondents reported sex education had not been taught in formal curriculum, and many teachers provided informal, vague, and limited information on sex education. While the Malaysian government attempted to introduce sex education into school curriculum by 2011, the idea remains controversial (Mutalip et al. 2012). The researchers investigated the acceptance of teaching sexual education in secondary schools. Half of the respondents agreed on the implementation of sex education, and girls expressed less agreement than boys (Mutalip et al. 2012).

Bernama notes in a *Malaysian Times* article on February 12, 2015, that while topics of reproductive functions

and health care are taught in science, Islamic studies, moral studies, and physical and health education, the debate over introducing formal sex education into public schools remains controversial. The Women, Family, and Community Development Minister (MFCDM) stated sex education would be imparted to teenagers ages 16 and above beginning in 2016.

Education

According to the “Malaysia” entry in Gale Virtual Reference Library (2013), the country has a centralized educational system that falls under the jurisdiction of the Ministry of Education (MOE). Its educational expenditure in 2011 was 5.9 percent of its gross domestic product (GDP) (CIA 2016). Preschools educate children ages four through six, after which they attend primary school. At the end of six years of primary school, students take a standardized test to get promoted to secondary school, which lasts five years (Gale Virtual Reference Library 2013). Both public and private colleges and universities offer postsecondary education. Since 2004, the newly established Ministry of Higher Education oversees postsecondary education (Gale Virtual Reference Library 2013).

Literacy

Female literacy in Malaysia has improved. UNDP (MWFC and UNDP 2007) data shows a 23 percent increase between 1980 and 2004, from 65 percent in 1980 to 88 percent in 2004. In comparison, the adult male literacy changed from 82 percent in 1980 to 95 percent in 2004. Despite “the overall declining trend in gender disparity,” the number of illiterate females was larger than males (MWFC and UNDP 2007, 28). While the literacy rates were similar for younger groups of both sexes, women from older age groups experienced low literacy rates (MWFC and UNDP 2007).

Between 2009 and 2013, the adult literacy rate ratio for females and males was 95–100 (UNICEF 2015a). An estimated 93.2 percent of the females aged 15 years and over can read and write, and the percent for males was 96.2 percent in 2015 (CIA 2016). This is an improvement from 2010, when the literacy rate for females was 90.7 percent and 95.4 percent for males (CIA 2016).

Education Access

Pre-K–12 education enrollment reveals little to small variations in gender. Between 2009 and 2012, 73 percent of the

boys enrolled in preprimary schools, but the enrollment for girls was 68 percent (UNICEF 2015a). While preschooling is not compulsory, primary education is required for all students at age 6, and almost all students aged 12–16 years receive secondary schooling (Gale Virtual Reference Library 2013). Enrollment data in the 1990s indicates “no apparent disadvantage faced by girls at all levels of the eleven years of basic schooling,” and female enrollment was on the rise (CEDAW 2004, 52). The 2001 data for MOE shows 51.4 percent of males and 48.6 percent of females enrolled in primary schools (CEDAW 2004). The 2005 estimation shows males and females are expected to receive the total 13 years of schooling (CIA 2016). In terms of the retention rate to the last grade of primary school, between 2009 and 2013, the female-to-male ratio was 101 to 100 (UNICEF 2015a). In secondary schools, the percentages by males and females were 49.5 percent and 50.5 percent, respectively (CEDAW 2004). There was a slight variation in secondary school participation between 2009 and 2013, 67 percent for male students and 66 percent for female students, and the ratio of gross enrollment in secondary education males and females in the same four years was 100 to 97 (UNICEF 2015a).

Two factors have contributed to the trend for gender equity in school enrollment. The increasing job opportunities in the 1980s and 1990s encouraged girls to stay in school longer (UNDP MWFC and 2007). Also, largely due to the commitment to global participation, Malaysia increased its educational expenditures from 1998 to 2001, which targeted greater school access, computer literacy, and gender equity (Gale Virtual Reference Library 2013). In particular, girls’ primary and secondary schools and residential schools were built in rural areas to increase educational access (CEDAW 2004). In terms of the combined enrollment at K–16, the female enrollment rate increased from 53 percent in 1980 to 67 percent in 2004, and males’ enrollment grew from 57 percent in 1980 to 66 percent in 2004 (MWFC and UNDP 2007). In fact, MOE data shows a decrease in the participation of male students in secondary and tertiary education (Gale Virtual Reference Library 2013). Within overall university enrollment, 57.8 percent were females, and 42.2 percent were males (CEDAW 2004). This is also confirmed by information from personal contacts with Malaysians; girls receive fair opportunities for study in primary and secondary schools, and they tend to perform better than boys in standardized examinations and find achievement in universities.

Regardless, female college students are underrepresented in engineering and technical majors, in which

30 percent of females graduate (Gale Virtual Reference Library 2013). It resonates with the late 1990s, when around 30 percent of the students were female in polytechnics and about 40 percent of the females comprised the total number of graduates in science, medicine, agriculture, and engineering (CEDAW 2004). Likewise, MOE data shows, in 2001, that males constituted 61.2 percent of the enrollment in polytechnic institutions, and 38.8 percent were females (CEDAW 2004). The difference in course taking can be traced to secondary schools. Many girls registered in home economics courses rather than engineering or science subjects in the late 1990s, probably due to socialized gender roles (CEDAW 2004). While both male and female high school graduates can apply for polytechnics run by the Ministry of Education, an average of 30 percent of the students in polytechnics were female in 1998, with the female enrollment rate in mechanical engineering being 5 percent (CEDAW 2004). Many women majored in commerce, food technology, hospitality, and fashion (CEDAW 2004).

In contrast, more women are interested in attending teacher training colleges, even though men and women are given equal access to teacher’s colleges operated by MOE (CEDAW 2004). Between 1996 and 2000, the yearly enrollment of females was higher than for males. In 2001, 57.8 percent of the enrollment in a teachers’ college were female, and 42.2 percent were male (CEDAW 2004). The MOE established scholarships and loans for high-performing college students; more than 60 percent of females received scholarships or loans that funded teaching and education in 1998 (CEDAW 2004). But fewer females received scholarships at postgraduate levels and certificate-polytechnic teaching scholarships as opposed to males (CEDAW 2004).

Teaching Workforce

According to the Gale Virtual Reference Library (2013), as in many other countries, female teachers comprise the majority in Malaysian public schools. In the 2000s, the number of male teachers declined; male teachers comprised 4 percent in kindergarten and 35 percent in primary and secondary schools in 2008. While college male and female teachers are generally comparable (Gale Virtual Reference Library 2013), their distribution differs across majors, with females underrepresented in the natural science field. The 1990s data shows 32 percent of the lecturers were female in polytechnics (CEDAW 2004).

Health

In general, Malaysia has an efficient and widespread system of health care; there is a two-tier system that consists of the government-run universal health care system and a coexisting private system (Castro 2009). Health services are offered free or at very low cost to citizens (MWFC and UNDP 2007). The Malaysian government is committed to providing universal access to high-quality health care. However, health care is basic in rural areas, with high-quality health care relatively unavailable in remote areas. Free health care does not apply to non-Malaysians.

Access to Health Care

Many government and private hospitals provide health services to citizens. As the Malaysian government supports universal health care, eligible women can access free, high-quality health care. Although the government hospitals possess the country's best health care equipment and facilities and have specialists in various fields, the main drawback is the shortage of staff (Bernama 2011). Because the government emphasizes the expansion and development of health care, eligible women are able to receive quality health care. Women's health is generally good, and the gender health gap is not obvious (Chee and Lin 2007).

The country has taken several significant health care-related actions. In 1995, all Malaysian health centers and polyclinics were redesignated as health clinics that provide maternal and child health care (Chee and Lin 2007). The increase in literacy among women along with poverty reduction account for the improved access to health facilities (MWFC and UNDP 2007). The government goes beyond reproductive health concerns to broader aspects, including "early detection of cancer, menopause, health needs of working women, and environmental issues affecting women" (MWFC and UNDP 2007, 29). The Ministry of Health (MOH) promotes screening for breast and cervical cancers at early stages (Chee and Lin 2007). Since the early 1990s, breast cancer clinics have been available in major government hospitals, and Pap smear screenings are promoted for women aged 21–65 years old (Chee and Lin 2007). However, fewer than 30 percent of women 20–54 years old had this procedure, and access was more difficult for women with less education or who lived in rural environments (Chee and Lin 2007).

Maternal Health

Malaysia has long given priority to women's health, "in particular their reproductive health (including maternity

care) and especially in the rural health network of clinics" (MWFC and UNDP 2007, 28). "A comprehensive range of services and information for women" is available in its health service infrastructure in the rural areas, especially providing "more remote and disadvantaged groups" with maternal and child health services (MWFC and UNDP 2007, 28–29). There has been an increase in trained and skilled health personnel in public and private institutions being involved with childbirth (Chee and Lin 2007; Kaur and Singh 2011). On average, the proportion improved from 85 percent in 1985 to 97 percent in 2001 (Chee and Lin 2007). It has increased from 92.9 percent in 1990 to 98.6 percent in 2008 (Kaur and Singh 2011).

Antenatal care coverage has been on the rise (Chee and Lin 2007; Kaur and Singh 2011). The average number of antenatal visits increased from about six visits in 1985 to around nine in 2001 (Chee and Lin 2007). It has increased from 78 percent in 1990 to over 90 percent since 2006. Some areas even had full coverage of antenatal care in 2008. UNICEF (2015a) data shows that an average of 96.52 percent of pregnant women received prenatal care in 2012. The country also witnesses an increased trend of safe deliveries (Kaur and Singh 2011). A primary health care staff delivers postpartum care at the health clinics, except eight home visits required by the MOH (Kaur and Singh 2011).

Western and traditional maternity care for pregnant women and infants coexist. Ali and Howden-Chapman (2007) suggest that traditional maternity care works better to help rural women through pregnancy and to achieve postnatal recovery. However, no data at hand shows the prevalent maternity care adopted by women nowadays. In terms of infant feeding, Malaysia remains improved. A study shows that although 75 percent of mothers breastfed babies at birth in the 1970s, few breastfed babies at two and six months (19% and 5%, respectively) in urban and rural Malaysia due to a high percentage of working mothers (Sinniah et al. 1980). There was a revival of breastfeeding in Malaysia in the late 1980s, which was prominent with less-educated women (Thapa and Williamson 1990). A 2007 study by Yee and Chin reports that 86.3 percent of the respondents initiated breastfeeding, but only 8.3 percent exclusively breastfed for six months and beyond. While there are still a number of working mothers, 32.2 percent of these women exclusively breastfeed for six months, according to a 2015 news article (Cilisos Editorial Team 2015). The country also lacks sufficient proper facilities for breastfeeding, such as nursing rooms in public places.

Maternal and Infant Mortality

Maternal health in Malaysia is relatively good compared to its Southeast Asian neighbors (Kaur and Singh 2011). Maternal mortality has been reduced due to the implementation of various programs by the government (MWFC and UNDP 2007). International data from the World Health Organization (WHO), UNICEF, the UN Population Fund (UNFPA), the World Bank Group, and the UN Population Division show the maternal mortality ratio/rate (MMR) has decreased in Malaysia in the past 25 years: from 79 deaths per 100,000 live births in 1990 to 40 deaths per 100,000 live births in 2015. Correspondingly, the maternal deaths have dropped from 410 to 200.

National data from the Malaysia MOH and Statistics Department portray a better picture. Kaur and Singh (2011) review data between 1990 and 2008 and find the MMR was 44 and 29 deaths per 100,000 live births in 1990 and 2007, respectively. Further, they indicate the MMR grew stagnant at about 28–30 per 100,000 live births since 2000. However, this review finds that in three large states, the MMR increased between 1997 and 2007. Women aged 40–44 years old experienced a higher MMR as opposed to those in the prime childbearing age group. The most common causes of maternal death include obstetric embolism, postpartum hemorrhage, and hypertensive disorders of pregnancy (Kaur and Singh 2011).

The infant mortality rate is a standard in indicating the overall efficiency of health care. UNDP data shows the child mortality rate for girls and boys has dramatically dropped between 1980 and 2004 (MWFC and UNDP 2007). The under-5 mortality rate (U5MR) for girls was 28.5 per 1,000 live births in 1980, compared to the 34.3 for boys. The U5MR fell to 7.1 for girls and 8.3 for boys in 2004.

In Malaysia, the infant mortality rate has experienced a steady decrease since independence in 1957, falling from 75 per 1000 live births to 7 in 2013 (CIA 2016). In 2015, the infant mortality rate for females was 11.07 deaths per 1,000 live births and for males 15.33 deaths per 1,000 live births (CIA 2016).

Tobacco Use

Based on an *Expat Focus* article, Malaysia outlaws tobacco advertising. As smoking affects people's health, it is banned in most public places, with violations leading to heavy fines or imprisonment.

Limited data is available in terms of women's tobacco-use habits. Choi's (2004) international comparison study

reports female smoking is not a problem in Malaysia and other South Asian countries. However, the female smoking prevalence increased for those 15–34 years old. A cross-sectional study by Manaf and Shamsuddin (2009) surveyed 408 female students in private universities in Kuala Lumpur and Selangor in 2005; the prevalence rate of these young urban Malaysian women was 18.6 percent.

Diseases and Disorders

Previous research shows cancer (in particular breast and cervical), diabetes, mental health, menopause-related conditions, reproductive disorders, lung disease, HIV/AIDS, and STDs affect Malaysian women's health and their counterparts in other South Asian countries (Choi 2004). The government has implemented gender-based programs, including the Prevention of Mother-to-Child Transmission of HIV Program, that target women and children and "have improved the chances of HIV-positive mothers delivering healthy babies" (MWFC and UNDP 2007, 29). Data from 2015 indicates the HIV prevalence rate is low among Malaysian young people (less than 0.1%). Specifically, it was 0.2 percent for males and less than 0.1 percent for females (UNICEF 2015a).

Female Genital Mutilation and Cutting

Female genital mutilation and cutting (FGM/FGC), also referred to as female circumcision, involves over 90 percent of Muslim women (Desk 2015; Reyck 2016). Despite strong voices against FGM from WHO and other international organizations (WHO 2016), in 2009, the Fatwa Committee of Malaysia's National Council of Islamic Religious Affairs determined female circumcision as obligatory for Muslims, but harmful effects should be avoided (Khalib 2012). While FGM in Malaysia is thought to be less severe (Desk 2015), it produces no health benefits for girls and women, only harm (WHO 2016). Cultural and social factors are common reasons for performing FGM (WHO 2016). FGM has a lot to do with social pressure to conform to others, cultural beliefs of femininity and modesty, preparation of girls for adulthood and marriage, and ensuring premarital virginity and marital fidelity (WHO 2016).

Employment

Women play an important role in the workforce and enjoy legal protections. The 1955 Malaysian Employment Act contains provisions that prohibit night and underground

work. Female employees are also entitled to maternity leave in the public and private sectors. Eligible women can also receive maternal allowances from employers.

The 1998 amendment provides flexible working hours and accords “maternity leave of sixty days (from forty-two days) for up to a maximum of five births” (MWFC and UNDP 2007, 28). The 2012 version amends the 1955 act by the Parliament of Malaysia. The new version stresses maternity leave that lasts no less than 60 consecutive days. The new act also adds that an employer commits an offense if a female employee is fired during her maternal leave, unless the business closes. Malaysia is “one of a group of twenty out of the 152 countries which provide maternity leave of less than eighty-four days” (28).

Largely because of the lobbying by women’s groups in the early 1960s, the government adopted “the principal of pay in 1967” and granted permanent employment tenure to women employees (28). Other protections include the Income Tax Act of 1967 that allows women to opt for separate assessment decisions. Additionally, the 1999 Code of Practice on the Prevention and Eradication of Sexual Harassment at the workplace is the first “means of recourse under the law” for women workers facing sexual harassment (28).

Data from the Ministry for Women, Family, and Community Development (MWFC 2014) shows 92.9 percent of women working in the public, but not informal, sector receive social security benefits. Women who work in the informal economy (such as wage workers) face extreme vulnerabilities (MWFC 2014).

Women Employed outside the Home

Women in Malaysia “gravitate towards traditionally women-identified occupations e.g. teaching, nursing and secretarial work” (CEDAW 2004). More women also work in manufacturing and service sectors. The increase of women in paid employment began during the country’s independence in 1957, when the focus shifted from agriculture to manufacturing services, and women’s role in the labor force grew social acceptance (MWFC 2014). In the 1980s and 1990s, a large number of women worked in the manufacturing and service sectors (MWFC and UNDP 2007). One reason is the economic growth after the recession in 1985 (CEDAW 2004). That women have more access to education also explains the increase of employment (MWFC 2014). In particular, more rural women entered employment in the textile, garment, electronics,

and hospitality industries (CEDAW 2004). The economic growth in the 1980s also boosted women’s employment in wholesale, retail, hotels, and restaurants (MWFC and UNDP 2007). Since 1990, there has been a tremendous rise of “female employment in the wholesale and retail trade, hotels, and restaurants sector and the financial services sector” (MWFC and UNDP 2007, xii). In the 1990s, more than 50 percent of workers in electronics and textiles were women; almost 90 percent of employees in the clothing industry were women too.

Changes have occurred with women’s occupations in the last decade. In the 2000s, Malaysian women’s employment in manufacturing dropped as migrant women from the Philippines, Indonesia, and Bangladesh arrived (MWFC 2014). Between 2001 and 2010, the percentage of females employed as service and sales workers increased from 16.9 percent in 2001 to 20.1 percent in 2008 and 2010. The percentage of women professionals increased from 5.6 percent in 2001, to 7.3 percent in 2008, and 8.3 percent in 2010; the majority of women in the professional category are teachers and nurses. In 2010, women technicians and associate professionals increased to 16.1 percent from 12.5 percent in 2001 and 15.7 percent in 2008. Fewer female employees worked in agriculture-related jobs, such as plants, machine operators, and assemblers (MWFC 2014). While the “overall occupational segregation by gender is declining, [it] . . . still prevails in some occupations” (MWFC 2014, 35).

The female labor force participation rate (LFPR) grew slowly (MWFC and UNDP 2007) and remained constant until 2012, which matched the global trend (MWFC 2014). The female LFPR grew from 44.7 percent in 1995 to 46.7 percent in 2000 (CEDAW 2004). Another source portrays a similar picture: the rate changes from 44 percent in 1980 to 48 percent in 1990, and it remained around 47 percent until 2004 (MWFC and UNDP 2007). Data from the Malaysian Institute of Economic Research showed that female LFPR was 45.7 percent in 2005, a mild decrease from 47.8 percent in 1990. In contrast, male’s LFPR in the same period remains over 80 percent, which is higher than the 2003 average rate of 53.5 percent for countries with higher levels of human development (MWFC and UNDP 2007).

Recent data shows little improvement for women with LFPR. In 2011, out of the labor force population, 63.4 percent were men with a LFPR of 79.8; 36.6 percent were women with a LFPR of 47.9 (MWFC 2014). Women’s LFPR in 2011 remains “consistent between 44% and 47%

for the last three decades and remains well below the participation rate for men” (MWFCFCD 2014, 29). Data from the Malaysia Department of Statistics (2015) shows 52.4 percent of the women were employed in 2013, and the percent in 2014 was 53.6, an increase of 1.2 percent. Over 80 percent of the males are employed in the same period, with a decrease of 0.3 percent (Department of Statistics 2015).

Gender differences also exist in the unemployment rate. In 2013, the unemployment for young people 15–24 years old also showed more females, with 9.3 percent male and 12 percent female (CIA 2016). Regarding the overall unemployment rate in 2014, 2.7 percent were male, and 3.2 percent were female (Department of Statistics 2015).

Work Opportunities, Pay, and Conditions

Labor regulations and employment rights do not eliminate gender inequity, and the equal treatment of women in the workplace remains an issue. In the mainstream public and private sectors, males usually hold the top executive positions, with few women in the upper echelons (CEDAW 2004). Female employees in Malaysia tend to be placed in low-paying jobs, working as typists, clerks, and secretaries (CEDAW 2004). A study that analyzes data between the economy boom in the 1980s and 1995 echoes that women in Malaysia “tend to be concentrated in lower-ranking positions that are lower paid and have poor training and career development prospects” (Fernandez 2009, 27). Further, this study points out the gender gap in earnings is largely due to the residual or discrimination component prominent in male-dominated occupations (Fernandez 2009). A recent study analyzes data in 1994 and 2004 and reports the gender earnings gap shrank in the upper-end wage distribution, but the bigger gender gap was at the bottom of earnings distribution (Goy and Johnes 2015).

A 2013 study shows many companies in Malaysia lack family-friendly facilities or flexible work arrangements; many lack a designated car park for pregnant women, nursing rooms for mothers, or child care centers. As a result, some new mothers quit working to be full-time housewives (Su-Lyn 2015). While the government is collaborating with corporations to encourage working mothers by increasing the number of child care facilities (Y-Sing 2014), the results are nominal thus far. Dewan (2014) cites data from the study by the Association of Women Lawyers that among the past 27 bar presidents, only 2 were female, and women were often perceived as “less competent and unable to handle big cases and more files.” The study also

finds more women experienced sexual propositioning and were bypassed for promotions due to their family roles (Dewan 2014). Similarly, while more women are found in senior management roles, males still dominate (Liang 2015). A 2013 survey by Talent Corp finds just 8 percent of the board members of all listed companies were women (Liang 2015). Out of the public opinions collected by UNICEF last year, 46 percent disagree, and 27 percent hold neutral views that women in Malaysia are treated equally to men in the workplace (UNICEF 2015b).

Family Life

In primary school textbooks, women’s primary roles were depicted as wives and mothers or were not presented as being able to have careers (CEDAW 2004). In light of this, the Ministry of Women and Family Development has requested that the MOE eliminate such stereotypical images and that women be presented in diverse occupations; in response, MOE made changes to the curriculum (CEDAW 2004). Regarding whether women and girls in Malaysia are subject to harmful traditional laws and customs, a poll of 460 people shows 51 percent agree or somewhat agree, 28 percent disagree, and 21 percent hold neutral views (UNICEF 2015b).

Family Structure and Household Responsibilities

Family composition might differ among different ethnic groups across regions and time. The extended family pattern was common when Malaysia was a rural-based country, but the family size decreased in many nonrural states since 1960. Limited data also shows a common family pattern in urban Malaysia is a nuclear family with parents and multiple children (YFU n.d.).

In urban areas where both parents may work, the father is the primary breadwinner, and the mother supplements the family income; in rural families, the father might be the only working parent (YFU n.d.). Some mothers even quit their jobs to become full-time housewives to take care of children, as there are often unfavorable child care services at work (Su-Lyn 2015). A report that surveyed 967 married and unemployed women found that 66.9 percent left work to look after their children, 42.8 percent left due to marriage, and 36.3 percent left upon their husband’s request (MWFCFCD 2014). Public opinion from 459 people in a poll by UNICEF (2015b) reports 25 percent agree or somewhat agree that women and men share equal

responsibility in housework and child care, and 57 percent disagree.

Marriage

There are two types of legal marriage: civil marriage and Islamic marriage (Lawyerment 2014). The former is known as monogamous opposite-sex marriage and is practiced by non-Muslim and nonnatives under the Law Reform (Marriage and Divorce) Act 1976 (Lawyerment 2014). While Muslim men may marry as many as four wives simultaneously, most have one wife; however, women may not have multiple husbands concurrently (Lawyerment 2014).

According to Section 23 of the Islamic Family Law (Federal Territories) Act 1984, a husband “must obtain the consent and views of the existing wife or wives and the permission from the Syariah [Sharia] Court to enter into a polygamous marriage, failing which he is deemed to have committed an offence under Section 123 of the Act” (Lawyerment 2014). However, in doing so, men “must be able to afford to take care of each of their wives,” and “the wives have little or no contact with each other” (Lawyerment 2014).

The Islamic Family Law Act, however, states that a wife’s maintenance by her husband is subject to her obedience (Laws of Malaysia 2002). A wife will have no entitlement to maintenance if she is not associated with her husband anymore, when she leaves her husband’s home without his consent, or when she has no valid reason but refuses to follow him to another home (Laws of Malaysia 2002).

While Segaran (2006) argues the Islamic Family Law Act suggests many Malaysian females still face discrimination associated with marriage, family, and inheritance, the 1957 Married Women Act protects a wife’s rights associated with property, court cases, and bank accounts (Laws of Malaysia 2006). Muslim women have the right to a dowry, “an obligatory marriage payment due under Islamic law from the husband to the wife at the time the marriage is solemnized. The dowry can either be in the form of money or property” (CEDAW 2004, 109). Also, all women have rights to retain their own names. The penal code also lists specific offenses against women, including those relating to marriage. For instance, the Domestic Violence Act 1994 (Act 521) recognizes that the victims of domestic violence are mainly women. According to the Employees’ Social Security Act 1969 (Act 4), a wife is entitled to her husband’s social security payment upon his death (CEDAW 2004).

Marital status data also suggests gender disparity. According to the Department of Statistics (2010), while the percentage of males and females who were married was similar (59.8% of men and 59.4% of women), the proportion of males who were never married (37.8%) was slightly higher (32.2%). By the mean age at one’s first marriage, males fell from 28.6 years in 2000 to 28.0 years in 2010; inversely, the age for females increased from 25.1 in 2000 to 25.7 years in 2010 (Department of Statistics 2010). For women, “Marriage is taking place at the later age wherein the age at first marriage for women went up from 17.4% in 1970 to 25.7% in 2010” (MWFC 2014, 28). There were more widowed women (7.2%) than widowed men (1.9%) in 2010, with more women (1.2%) divorced or permanently separated than men (0.5%) in the same year (Department of Statistics 2010).

Fertility

Although “access to family planning services has enabled women to choose freely the number and spacing of their children” (MWFC and UNDP 2007, 29), fertility rates declined, dropping from 4.0 percent in 1980 to 2.3 percent in 2010 (MWFC 2014). According to the United Nations, the projected fertility rate will drop to 1.91 children per family by 2020, which will be lower than the 2012 rate of 2.1 children. Given the potential decline, Malaysians are encouraged to have children. It is possible more women seeking education and careers marry at a later age (Sipalan 2015).

There are restrictions on who can utilize nontraditional methods for childbearing. Only married couples can go through in-vitro fertilization (IVF); same-sex couples and single parents are excluded, according to the reproductive laws in Malaysia. Surrogacy is illegal for Muslim couples. While non-Muslim couples may find leeway, there are complications with this route (Lim 2015).

Contraception

Based on Kumarasamy (2012), the contraceptive usage was low in Malaysia, and the proportion of women within the fertile age group using any form of contraception was only 48 percent. This number is much lower compared to Singapore (71%) and Thailand (73%). Consequently, a sizable number of unplanned pregnancies occur, some of which lead to abortions or abandoned newborns. One possible reason is the misinformation regarding contraception, resulting in unreliable or incorrect contraception (Kumarasamy

2012). Kumar asserts contraception is not accessible to all women; fewer than 50 percent of eligible women of child-bearing age can access contraceptives. A woman's right to contraception depends on national policies on their age, marital status, and other factors (Kumar 2015).

Politics

Women have voted since independence in 1957 and are members of different political parties (CEDAW 2004). The constitution grants each qualified citizen the right to vote. In 1999, out of a total of 9,509,332 registered voters, 49.8 percent were women (CEDAW 2004).

Women are underrepresented in political participation. While there is no gender-based discrimination against women "with respect to participating in the electoral process and holding elected offices" (CEDAW 2004, 32), they have primarily "played a supportive role to men except in the women's wings of political parties, where women elect and choose their own leaders" (CEDAW 2004, 20). There were no gender-based political parties (CEDAW 2004) and few gender-sensitive leaders (Ariffin 1999).

Female leaders are unable to exercise their political rights freely. Their political behavior "is molded by the political culture and tradition of the political party" (CEDAW 2004, 25). As such, they behave in a way to create an image accepted "by all in the party and society at large," and "their views or political postures reflect the ideology of the ruling party" (CEDAW 2004, 25).

The female representation in government has been extremely low and seen slow growth. Malaysia models its Parliament after the Westminster system, and since "the first election to the Federal Legislative Assembly in 1959, the number of female candidates elected to Parliament has increased at a moderate rate" (CEDAW 2004, 32). Specifically, it grew from 2.9 percent (3 out of 104) in 1959, to 4.1 percent in 1986, to 7.3 percent in 1995, and 10.4 percent in 2000. In the House of Representatives, the number of female parliamentarians increased from 4.5 percent in 1980 to 10.4 percent in 2000, yet decreased to 9.6 percent in 2004 (MWFC and UNDP 2007). Overall, the number of women at federal levels did not change with 2 women ministers out of 28 people in the cabinet. By 2001, the number rose to 3 upon the establishment of the Ministry of Women and Family Development. At the state level, the percentage of women elected in different state assemblies between 1959 and 2000 increased from 2.7 percent in 1986, to 4.8 percent in 1995, and 5.5 percent in 2000 (CEDAW 2004).

In comparison, women officers in the Malaysian Foreign Service have significantly increased between 1992 and 2002. In 2002, female officers were 20.7 (69 out of 333) "as compared to 18.8 percent (64 out of 340) in 2001 and 15.4 percent (42 out of 273) in 1999" (CEDAW 2004, 43). Cultural and professional constraints or barriers from the host countries, other than gender-based discrimination, have affected their assignments (CEDAW 2004).

This country is committed to women's empowerment. "The low representation of women in Parliament and the State Assemblies is an indication of the fact that few women are elected to the apex bodies of the various political parties" (CEDAW 2004, 34). Each party was asking for more women members, and some parties adopted affirmative-action strategies to boost female participation (CEDAW 2004). The major political parties focus on recruiting young women supporters (MWFC and UNDP 2007). Further, the country promised to achieve the target of 30 percent female parliamentarians (out of 222 seats) as stated in the 1995 Beijing Declaration and Platform for Action (MWFC and UNDP 2007). The country also amended Article 8(2) of the Federal Constitution on August 1, 2001, and added the prohibition of discrimination-based gender to the list of religion, race, descent, and place of birth (CEDAW 2004). Based on data from the World Bank (2016), the proportion of female parliamentarians by 2015 is 10.4 percent, which is far from reaching the 30 percent target.

Feminist Movements and Women's Organizations

In Malaysia, feminist movements apply to multicultural groups and continue to play an active role toward ending discrimination, harassment, and violence against women. According to Ariffin (1999), feminism is seen as a Western concept and has been complex, crossing racial, ethnic, and class divisions within women's groups. Ng et al. (2006) identify four dominant feminist groups in Malaysia's history: nationalist feminism, social feminism, political feminism, and market-driven feminism.

Female officers in the government also play an active role in improving the status of women. For instance, Ariffin (1999) documents how female officials attended an international conference in Beijing in 1995 and became vocal on women's issues, as they sought to establish working relationships with nongovernmental organizations (NGOs). Noteworthy women's NGOs in Malaysia include All Women's Action Society, Women's Aid Organization, and Sisters in Islam. The National Council of Women's

Organization, “a national coalition body for many women’s NGOs, often provides the final channel of communication to the government in seeking the passing of demands” (Ariffin 1999, 420). Feminists also face criticism and backlash. In 2012, the prime minister openly declared that the women’s rights movement was unnecessary because equality was already given (Razak 2012).

Lesbian, Gay, Bisexual, and Transgender (LGBT) Rights

A Pew Research Center survey (2013) found that 86 percent of Malaysians hold that homosexuality is unacceptable. However, Malaysia retains the colonial-era penal code and still criminalizes homosexuality. Forty-two of the 53 countries that used to comprise the Commonwealth are antihomosexuality, and Malaysia is one of them (Gerber 2014). Shah (2013) argues that Malaysia does not tolerate homosexuality now due to the affront to Islam. In 2014, an opposition leader faced five years of imprisonment largely for political reasons (Gerber 2014). Same-sex marriage is prohibited; same-sex couples are not recognized and cannot adopt children together. Same-sex couples also cannot seek IVF treatment (Lim 2015).

“Discrimination against LGBT people is pervasive in Malaysia,” as stated by Human Rights Watch (HRW) last year (Melayu 2015). Transgender people “face arbitrary arrest, physical and sexual assault, imprisonment, discriminatory denial of health care and employment, and other abuses,” according to HRW (Melayu 2015). This group is often subjected to abuses such as “assault, extortion, and violations of their privacy rights” from Religious Department officials and police (Melayu 2014).

Religious and Cultural Roles

As stated earlier in the overview, Malaysia is a multiracial nation, and Islam is the most widely professed religion. By 2010, the majority (61.3%) of the population were Muslims, the second-largest group was Buddhists (19.8%), and the third-largest group was Christians (9.2%).

Contrary to the Constitution of Malaysia, freedom of religion is subject to many restrictions. A person must be Muslim to be considered Malay; conversion to another religion is difficult and results in punishments. Many Muslims who have attempted to convert received death threats (Perlez 2006). A non-Muslim must convert to marry a Muslim (Bernama 2013). To avoid a suspicion of “engaging immoral acts,” unmarried Muslim couples are prohibited

from occupying “a secluded area or a confined space” and face charges if they disobey (Pak 2010).

As 61.3 percent of the population practices Islam, Muslim women’s clothing stands out. Although there is no required law, many women wear the tudung (or tudong), a type of hijab that covers the head and exposes the face. Some government buildings have a dress code that bans entry of both Muslim and non-Muslim women if they wear “revealing clothes (Hassim 2014). The tudung was uncommon prior to the 1979 Iranian revolution and had been used primarily in rural areas (Heath 2008). After the 1970s, however, the tudung grew in popularity (Leong 2015), largely due to the increase of religious conservatism among Muslims (Koh and Ho 2009). It is noteworthy that Muslim and non-Muslim women in the International Islamic University must wear the tudong (Windows on Asia 2014). Further, by 2015, this country had “a fashion industry related to the tudung (Boo 2015),” and Muslim women not wearing the tudung are negatively perceived (Leong 2015).

The status of Muslim women is religiously conditioned. As stated earlier, they must obey as prescribed in the Islamic Family Law Act to obtain maintenance from the husband (Laws of Malaysia 2002). The new Islamic law of 2006 allows Muslim husbands to divorce or take up to four wives and grants men more control over their wives’ property (Kent 2006a). In response, Marina Mahathir, an active campaigner for women’s rights, “described the status of Muslim women in Malaysia as similar to that of Black South Africans under apartheid” (Kent 2006a, 2006b). Conservatives disagreed in that Mahathir’s comments undermined “the prominent role of women in Malaysia compared to other Muslim and/or east Asian countries” (Kent 2006a).

Issues

Persisting Inequality

Malaysia is committed to moving toward gender equality (MWFC and UNDP 2007). The country has implemented various programs with NGOs to reduce poverty for women, in particular for single mothers; to increase women’s educational attainment and their participation in higher-paying occupations; and to improve women’s involvement in business activities and their health status (MWFC and UNDP 2007).

Regardless, inequality in key areas persists. UNICEF’s poll of 459 people with regard to status in society suggests 70 percent say men’s status is higher, 22 percent find

equal status, and 1 percent think women's status is higher (2015b). In contrast to the minimal gap in health access, "gender inequalities exist in work, income, and political leadership indices" (Chee and Barraclough 2007, 141). For instance, women still face discrimination in the workplace, "especially at the managerial level" (Othman and Othman 2015, 26). They tend to sacrifice more for the family. Women are underrepresented in the enrollment of natural science majors. And the women parliamentarians constitute 16 percent of the cabinet, a far cry from the 30 percent goal listed in the 1995 Beijing Declaration and Platform for Action. The UNDP suggests women should be empowered "through increased political representation, and through a greater proportion of positions in higher paying jobs" to further reduce gender gaps (MWFC and UNDP 2007, xii).

Trafficking and Prostitution

While "trafficking in persons is not specifically criminalized in Malaysia, there are laws in the country aimed at and used to combat trafficking in persons, including women" (CEDAW 2004, 27). The Royal Malaysia Police is the main law enforcement agency, and the Social Welfare Department is responsible for protecting women younger than 21 who have been forced into prostitution. The MWFC runs four shelters for women (U.S. Department of State 2015). The country passed the Child Act 2001 (Act 611) to protect girls against prostitution activities and provides protection homes (CEDAW 2004).

It seems that Malaysia has made little progress in containing trafficking. According to the *Malaysian News* article on June 23, 2014, Malaysia was downgraded to the lowest level (Tier 3) in eliminating human trafficking among three other countries. Based on the recent report by the U.S. Department of State (2015), Malaysia was placed on the Tier 2 Watch List. This report shows that many young women, most from Southeast Asia and some from Africa, were recruited to work legally in Malaysian restaurants, hotels, and beauty salons, but they were forced into the sex industry (U.S. Department of State 2015). Some Vietnamese girls and women were forced into prostitution through brokered marriages.

Violence against Women

Women are vulnerable to sexual harassment, domestic violence, and rape. When asked whether women are adequately protected from sexual harassment, domestic abuse, and rape, 20 percent of the 458 polled agree and somewhat

agree, 63 percent disagree, and 17 percent are neutral (UNICEF 2015b). Data from the Women's Aid Organization Web site shows that the number of rape cases in 15 states increased from 1,217 in 2000, to 2,431 in 2006, to 3,098 in 2007. Based on the Penang Women's Development Corporation, 31,685 rape cases, 42,449 domestic violence cases, and 24,939 cases have occurred between 2000 and 2013, and there were about 3,000 rape cases every year (Bernama 2015). Based on information from Women's Aid Organization, 90 percent of the rape cases have gone unreported.

The government provides certain protections. Since 2010, trains on the Malaysian Railway have added women-only cars to contain sexual harassment, and there are women-only buses in Kuala Lumpur (MSNBC 2010). In 2011, the government initiated women-only taxi services in greater Kuala Lumpur (AFP Kuala Lumpur 2011). Despite the Domestic Violence Act of 1994, this type of violence has increasingly become a public issue and received concerns from feminist organizations (Bernama 2014). Domestic abuse cases become complicated, as sharia law forbids wives to disobey husbands.

Maldives

Overview of Country

Maldives is a double chain of 26 natural atolls, oriented north to south, in the Indian Ocean and Arabian Sea in Southern Asia, to the south and southwest of India. The country consists of 1,190 coral islands stretched over 34.75 square miles (900 sq. km). Maldives is the smallest Asian country and is nearly twice the size of Washington, D.C. (USAID 2015).

The Maldives' location near the equator contributes to the islands' tropical climate. There are two seasons: wet and humid, and dry. This geography also provides the Maldivians' main sources of commerce: tourism and fishing (CIA 2015). Tourism began early in the 1970s and is prospering with 70 resorts located among the 26 atolls. However, Maldives' proximity to the ocean has left it susceptible to several global issues, including rising sea levels, climate change, global warming, limited water resources, and one natural disaster—the 2004 tsunami (CIA 2015).

In the early 2000s, the Human Development Index (HDI) of the Maldives has gradually increased. The United Nations classified the Maldives as a lower middle-income country. The HDI measures average achievement in basic human development capabilities, and the Gender Development Index (GDI) adjusts this to reflect the inequalities between men and women. At 0.767 (2007 index), the GDI is almost equal (99.5 percent) to the HDI and ranks the Maldives 47th of 155 countries in the both HDI and GDI values (UNDP 2010).

Because of their continuous contact with surrounding countries, such as India and Pakistan, Maldivians originate from the Indo-Aryan peoples. Nonetheless, because of its locations near India, Africa, and South Asia (Singapore, Malaysia, Thailand, and Cambodia), the population is ethnically and culturally diverse. Ethnic groups include South Indian, Sinhalese, Dravidian, Negrito, Caucasian, and Arab (CIA 2015).

The one official written language, Dhivehi, was derived from Arabic and spoken by the first settlers. English is spoken by government officials and taught in a few schools, but it is not an official language (USAID Maldives 2016).

In July 2014, the population was 393,595 (54% male), with most Maldivians under the age of 54. The median life expectancy is 75 years (CIA 2015).

Overview of Women's Lives

Women hold prominent positions in government, business, and education and can pursue secondary education. Despite these opportunities, women still face unequal treatment in many areas, including but not limited to inequality in religion, sexuality, and extramarital sexuality.

Post-Tsunami 2004

Following the tsunami in 2004, the UN Children's Fund (UNICEF) and the World Health Organization (WHO) evaluated Maldives' countrywide achievement of Millennium Development Goals. Nutrition was first to be evaluated, and it was clear Maldives had reduced the number of people suffering from hunger; however, children and infants remained affected by lack of nutrition. Following the tsunami, 19 percent of children were diagnosed as stunted or had a low height-for-age ratio. In a 2007 report, 81 percent of infants younger than six months old received water, nonmilk liquids, and breast milk mixed with water, which contributed to stunting (WHO 2016).

Currently, UNICEF, in collaboration with the Maldivian government, is providing instruction to mothers regarding nutrition as well as nutrition supplements to children to prevent stunting and reduced height (UNICEF 2015).

Girls and Teens

In 2014, an estimated 20 percent of Maldivians girls were under 18 years old (UNICEF 2015). The quality of life has improved since 2000; many girls and teens receive quality education, over 60 percent advance to secondary school and college, and many receive proper medical care in Malé

and the outer atolls (UNICEF 2015). The Ministry of Education has also presented plans to the United Nations to improve and encourage educational opportunities for all. Prior to 2012, many teens would need to leave Maldives for college and university studies upon completion of secondary education. Maldives established the College of Higher Education, and in 2011, the college was expanded in Maldives National University. This provided an opportunity for many lower and middle socioeconomic students to participate in undergraduate- and graduate-level courses (MNU 2016; UNICEF 2015).

According to the Maldives National Bureau of Statistics, 93 percent of young women 15–19 years old are not married. According to Maldivian law, the legal age of consent to marry is 18 years of age. If a young woman desires to marry prior to age 18, special consent must be given by the marriage registrar at the marriage court.

UNICEF reported that since 2008 there has been a steady increase of rapes and other forms of violence (domestic violence, bullying, and sexual harassment) against young girls and teenagers. An outcome of violence is sexually transmitted diseases and HIV/AIDS. Although few individuals have HIV/AIDS, the Ministry of State for Gender, Family, and Human Rights is concerned about the potential for an HIV epidemic among teens. In a positive light, many are becoming educated about the risks and using safe practices (UNICEF 2015; World Bank 2016).

Health

Access to Health Care

Maldives has worked directly with the United Nations to accomplish the Millennium Development Goals (MDG) for health care. Progress in reducing child mortality and

battling HIV/AIDS, malaria, and other diseases is documented among all the atolls. Additionally, beginning in 2015, licensing exams for practicing doctors were required for all atolls in Maldives (UNDP 2010).

From 2000 to 2012, Maldivians have seen an increase in the average life expectancy, which was 72 years in 2010. Infant mortality was 24 per 1,000 births (UNDP 2010). Over the past several years, life expectancy for men has increased from 70 years to 73 years and from 70 years to 75 years for women (WHO 2016). Several factors together brought about this improvement, including improved access to health care, diagnostic services, and other health services, such as labor and delivery, emergency services, and improvement in specialized medical programs, such as cardiology and cancer. Finally, healthier lifestyles and health awareness have emerged within the atolls (WHO 2016).

Fertility rates are falling in Maldives. In 2000, the birth rate was almost 7 births per woman. In 2006, Maldives decreased dramatically to 2.1 births per woman (CIA 2015). The decline was more pronounced in rural atolls when compared with the capital city of Malé. As infants born before 2000 are reaching reproductive age, the crude birth rate (number of children born overall) is expected to increase, but the birth rate per woman is expected to remain low.

The crude death rate (CDR) has steadily declined and stabilized at 4 per 1,000 people during the last decade. The significant decline in CDR was mainly associated with the decline in infant and child mortality rates over the last two decades. Access to better health care, the expansion of better health services to the atolls, and effective immunization programs have played a major role in decreasing child death rates (UNICEF 2015).

According to the country statistics, in 2009, 93 percent of children ages 12–23 months were fully immunized.

Crude Birth and Death Rates

Crude Birth Rate

Crude birth rate (CBR) indicates the number of live births occurring during the year per 1,000 people, estimated at midyear. Subtracting the crude death rate from the crude birth rate provides the rate of natural increase, which is equal to the rate of population change in the absence of migration.

Crude Death Rate

Crude death rate (CRD) is the number of deaths occurring among the population of a given geographical area during a given year per 1,000 midyear total population of the given geographical area during the same year.

Ninety-five percent of the women had prenatal and postnatal care and delivered in a hospital or care facility attended by a skilled or licensed health care worker. Maldives is making a significant effort to encourage all women to seek postnatal care 40 days after giving birth (Ministry of Health 2014).

Newborn Delivery and Postnatal Care

Prenatal and perinatal care has increased in the early 2000s. According to statistical data from the Ministry of Health in Maldives (2014), 95 percent of women deliver in a health facility and are attended by a skilled provider, including a gynecologist, doctor, nurse, midwife, or community or family health worker. Unfortunately, only 46 percent of mothers have a postnatal checkup within 4 hours of the delivery, 21 percent had a postnatal checkup within 2 days, and 6 percent had no postnatal checkup within 41 days of delivery (MOHF 2009). Despite the high number of mothers delivering with skilled professionals, family demands and living in rural atolls, including outside of Malé where many professionals are based, means mother and baby often do not receive the necessary postnatal care. The Ministry of Health is continuing to try and find solutions to ongoing problems (Ministry of Health 2014).

Disease and Disorders

Maldives has made notable strides to be disease free. According to the Centers for Disease Control and Prevention (CDC), there have been no indigenous cases of malaria in Maldives since 1984. Children are vaccinated for polio, neonatal tetanus, whooping cough, and diphtheria. The country is making progress in eliminating leprosy, a chronic disease caused by bacillus attacking the skin and nervous system, and filaria, a parasitic disease spread by flies and mosquitoes (CDC 2014). Significantly, there has not been a case of filaria reported in Maldives during the past three years.

Dengue fever, diarrheal diseases, and acute respiratory infections (ARI) continue to plague the children and adults of Maldives. In 2012, ARI; viral fever (a virus that causes body and muscle aches, a fever, nasal congestion, cough, and vomiting); and diarrheal diseases were the communicable diseases most reported, amounting to 694 incidents per 100,000 people. Typhus, a fever caused by a parasite, and toxoplasmosis, an infection that causes flu-like symptoms, are also endemic in Maldives (CDC 2014).

Maldives is in the process of evaluating and rebuilding irrigation, sanitation, and waste management facilities destroyed by the 2004 tsunami (Ministry of Health 2014).

Sex Education, Teen Pregnancy, and Abortion

In 2012, the Department of National Planning completed a 10-year study indicating that because of the high number of unsafe abortions, rising infanticide, and increasing rates of sexually transmitted diseases, including HIV/AIDS, Maldivian youth need more sex education and expanded access to reproductive health services. Contraception use among married couples was found to be “relatively low,” with only 27 percent of married women using modern prevention, such as birth control and intrauterine devices (IUDs). Husbands often control wives’ health decisions, usually citing religious and cultural ideology as the basis for their beliefs.

Sports and Recreation

In 2011, 27 young women established the first Maldivian women’s national football (soccer) team. With support from Switzerland and the UN Development Programme (UNDP), the Football Association of Maldives launched a project to increase women’s participation in sports. The United States provided additional support of USD\$4.1 million to encourage sports as a tool for women’s empowerment (UNDP 2010). Despite the initial negativity, the team’s greatest goals have been to create a national football team and play in it. Earlier generations of women, mothers, and grandmothers never dreamed of playing professional football; however, because of new initiatives launched in September 2010 that break gender stereotypes, the team has played a series of games with Qatar, India, and Myanmar, among others (FIFA 2015).

Education

On November 11, 1968, the Ministry of Education in Maldives was established by Parliamentary Act 3 of 68. In 1978, Maldives unified its education system, which had previously been split by atolls. Several goals were created to be completed within four decades. In 2008, some of the goals were completed when the People’s Majlis (Parliament) adopted a new constitution that gave structure and organization to education. Preschool education is two years and is usually held in private homes where children ages four to five years old are taught the Koran with

qualified teachers. Primary education begins at age six in a traditional school and lasts seven years. The instruction includes basic education in all academic areas, such as mathematics, languages, arts, and science. Koran studies are held after school within family homes, and classes are divided based on age and sex (Ministry of Education 2016). Secondary schooling is divided into two levels: lower (grades 8–10) and upper (grades 11–12). Following a test given in 12th grade, it is determined whether university studies are appropriate for students. Maldives does not have universities, so most students continue their schooling in England or India (UNESCO-IBE 2011).

The educational act established several goals from preschool to secondary education (UNESCO-IBE 2011), including raising literacy rates to 70 percent for both males and females, increasing the primary education rate to 98 percent, and increasing the quality of teachers.

In 2014, 35 percent of Maldivian female adolescents were enrolled in school, but according to the *CIA World Factbook* (2015), most girls leave school at age 13. However, 2011 statistics indicate that 98 percent of 15-year-old girls successfully passed the country's literacy tests (UNESCO-IBE 2011). Child-supportive teaching became very successful, and many island communities joined voluntarily. A countrywide government initiative expanded an education program to support young women focused on achieving secondary school. This has enabled the girls and young women in preschool and primary schools to be fully engaged in their future educational goals (UNICEF 2015).

Educational conditions outside Malé are more difficult for all children. Libraries are nonexistent, and other learning materials are scarce. Separate restrooms for girls are usually unavailable, making it difficult for young women to attend school during menstruation. This is a major reason why adolescent girls go to school sporadically or even drop out altogether. The number of secondary schools is limited, and students typically have to live away from home to attend secondary school. Families are often reluctant to have daughters away from home, especially when considering the cost of travel, room, and board (UNDP 2010).

Children with Disabilities

In 2009, it was estimated that more than 6,000 children ages 2–9 had some type of disability—mobility, speech, and hearing being the most common (MOHF 2009). Children with disabilities typically have little or no access to services, especially outside Malé. Appropriate education, basic health

services, and future livelihood are invisible to those without caring parents or educators. Additionally, those with disabilities without supportive homes and provisions for future monetary support are left without even basic necessities. In 2001, the “First Steps” Early Childhood campaign was established to change the conditions for children with disabilities. An evaluation of its effectiveness was completed by UNICEF and noted that attitudes and behavior changed in Maldivians linked to the campaign (Kolucki 2005).

In 2004, UNICEF, with support from the Ministry of Education, created a plan with several solutions to improve education in Maldives. Twenty Teacher Resource Centres (TRCs) spread throughout the 1,900 atolls are equipped with broadband Internet and enable teachers access into national and global teaching communities. Child-friendly teaching methods have reduced costs because technology cuts down on the use and cost of expatriate teachers. The TRCs are available to all students in rural and urban populations, and one teacher is always available to answer questions with children. This has improved educational skills throughout all the atolls, especially since the tsunami in 2004, when many children were displaced (UNICEF 2015).

A few years later, the World Health Organization (WHO), under direction by Disability and Rehabilitation (DAR), created an initiative “to enhance the quality of life for persons with disabilities through national, regional, and global efforts” (UN 2011). Its purposes were to provide entry into the education system and identify impairments and provide appropriate support (UNICEF 2015). The DAR initiative is ongoing today in Maldives.

Employment

Over the past several years, women have remained underrepresented in social and economic life in Maldives. The first shift of opportunity occurred when Maldives established a new program with the support of the UN Development Programme (UNDP) called Employment and Enterprise Development for Women and Youth. The program began in 2011 and continues through 2015 (UN 2011). The overall purpose is to strengthen and provide economic opportunities to vulnerable groups, such as women and youth in rural areas. This will also provide new employment opportunities and services, such as a national framework focused on tourism to improve employment and labor opportunities for women (UNDP 2010).

In recent years, Maldives has become a middle-income country thanks to the rapid growth of tourism and fisheries

combined with a parliamentary amendment legalizing foreign ownership of land bringing in USD \$1 billion. The expansion of these opportunities has provided many women and men with opportunities for expanded employment, formally and informally. Women still participate in thatch weaving, the practice of weaving coconut leaves together for fishing nets, rooftops, and supports for other plants (CIA 2017).

One area that is lacking is child care facilities. With the increase in employment opportunities, challenges for women to remain employed following the birth of children and proper supervision have arisen. Therefore, many women have shifted to the informal sector, home-based careers, or contributing to the family. Almost 90 percent of women are self-employed in cottage industries, making woven mats, clothing, and handicrafts (Everyculture.com 2016; Quinn 2011).

The government employs the largest number of people. Sixty-two percent of men are employed by the government versus 38 percent of women. However, of those women in government, 54 percent of the government jobs focus on the education, health, and welfare sectors. The education sector employs the second-highest number of women, with women teachers dominant in the primary and tertiary levels.

Although the female labor force is growing, the unemployment rate for women continues to be three times higher than for men. In 2009, 8 percent of men were unemployed compared to 24 percent of women. Nearly half the employed women in the atolls and 40 percent of employed women in Malé fall into the category of home-based, own-account workers or contributing family workers.

Despite provisions in the constitution and the 2008 Employment Act, no policies were in place to provide equal opportunities for women's employment. The absence of child care facilities has made it difficult for women to remain employed after having children. It is frowned upon for women to stay on resort islands for extended periods, and they are discouraged from working at tourist resorts (Suood 2015). Some employers discourage women from marriage or pregnancy, telling them it could result in employment termination or demotion (UN 2011).

Family Life

Marriage

The Maldivian Family Act passed on December 27, 2004. According to the law, Maldives' legal marriage age is 18,

although according to a report for the Rights of Children and Children's Court, marriage before 18 has increased among young women. In 2009, the country showed a 4 percent increase in marriage among young girls 14–18 years of age (MOHF 2009). Despite the law, it is relatively easy for young women under 18 years to get married. They are required to complete the application to marry, and the Registrar of Marriages makes the decision based on the following criteria: (a) whether the youth has attained puberty, (b) whether they are in good physical health, (c) and whether their spouse is able to maintain a livelihood (AG Office 2004).

Each time a man seeks marriage to an additional spouse, he must petition the Registrar of Marriage, showing proof of financial viability. The law has several links with Islam. First, sexual relations for women and men before a first marriage are illegal. Women may not marry an excess of three times in any circumstance, including during widowhood, and widows must wait 4 months plus 10 days before marrying again. Men and women are restricted from marrying anyone outside the Muslim faith, and the court must confirm both individuals have never married outside the country. If an individual violates any of these conditions, punishments are outlined by parliamentary rule. Violation of the law can result in severe punishment, such as long-term imprisonment or stoning (AG Office 2004).

Despite the regulations to marry in Maldives, obtaining a divorce is simple. A husband or wife only has to petition a judge, and it is complete. The following reasons for divorce are established within the Family Act: "I. Commission of an act by the husband that injures the integrity of the wife; II. Cruelty by husband toward a wife; III. The compulsion by husband toward a woman to commit an act unlawful by religion; IV. Abstinence by husband, without just cause, from performing sexual intercourse with the wife for a period exceeding four months" (AG Office 2004). In terms of custody, a mother is entrusted with care of her children provided she is a Muslim, of sound mind, capable of providing the compassion and care necessary for raising the child, and not involved in the commission of vice acts prohibited in sharia. Vices include abuse, violence, and husband's unemployment. Due to the simplicity of obtaining a divorce by both men and women, Maldives divorce rate has escalated since 2011. The National Bureau of Statistics estimated that 10.97 of 1,000 people, or approximately 11 percent of the country, has been granted at least one divorce (Ministry of Finance and Treasury 2016).

Women in Society

Despite the emergence of opportunities, a status on gender roles from the United Nations (2012) reported that traditional roles of men and women remained intact (UNDP 2010). Traditionally, the woman remains at home as a wife and mother. Domestic burdens are traditionally high due to the care of extended families, particularly in rural areas. These duties involve domestic responsibilities with children, including those of the second or third wives and aging parents (UN 2011).

Politics

Maldives was first discovered in the 12th century by Europeans and non-Arabs. Previously, Maldives had been established as a sultanate, indicative of its Arabic roots. In 1887, Maldives became a British Protectorate, and in 1968, it was declared a republic (CIA 2015). Maldivians were entitled to vote, and supreme power rested with the parliamentary group; Maldivians were given independence three years later. President Maumoon Abdul Gayoom ruled for 30 years (six terms) through a series of single-party referendums. In August 2003, political demonstrations in Malé, the capital of Maldives, changed the political system and expanded political freedoms. Between 2005 and 2008, two major political changes occurred. Political parties were organized, and a “Special Majlis” (Constitutional Assembly) was established. Maldives created a constitution and elected a president. President Gayoom was defeated in the polls by President Nasheed. In late 2012, President Nasheed resigned and turned power over to Vice President Mohammed Maniku, who remained the president in 2014 (CIA 2015). In 2013, a new election was held among all the atolls of Maldives and President Abdulla Yameen. Abdul Gayoom was elected from the Progressive Party of Maldives (PPM). President Gayoom who had served as the incumbent president prior to being elected, is the head of state, Commander-in-Chief of the Armed Forces and the Police (Presidency Maldives 2013).

Religious and Cultural Roles

By law, Maldives has only one religion: Sunni Islam. Even though Maldivians actively practices Sunni Islam from birth and throughout school, they practice a reformed Islam, which allows women to remain unveiled, permitting multiple divorces between men and women, and allowing

women to obtain land. Educationally, children within the ages of four and five years gather at private homes, known as a *madrassa*, established by the Ministry of Education. The Koran, among other subjects, is taught to young children by fully trained teachers. Religious education continues after school as students advance, and it is primarily taught in the home (UNESCO-IBE 2011).

Religious Freedom and Liberty

The constitution and other policies in Maldives strictly forbid the practice of any other religion. Additionally, government jurisdiction enforces the restrictions placed on persons living in Maldives. Throughout the years, there have been increasing reports of abuse of religious freedom, religious intolerance, and pressure to conform to a stricter practice of Islamic practice (International Religious Freedom Report 2012). All citizens are required to practice their religion in private or at a mosque, especially during the tourist season. The 800,000 tourists who visit annually and the 100,000 foreign workers from Bangladesh, Sri Lanka, India, and Pakistan are also encouraged to practice in private.

Within the country, the Protection of Religious Unity among Maldivians Act states that both the government and people must protect religious unity within the country. Even though Maldives has opened its atolls to many nations, religiously it adheres to one religious ideology, Sunni Islam. The government has passed the Protection of Religious Unity with the aim to protect Maldivians from hearing outside Western religions, prohibit sermons that many be interpreted as racially or gender discriminatory, prevent access to education or health services (blood transfusions from a nonbeliever) in the name of Islam, and prevent hatred toward people of any other religious affiliation (International Religious Freedom Report 2012). Items such as Bibles, Christmas cards, and alcoholic items cannot be sold, and marriage to non-Muslims is restricted. Maldivians are not allowed to share religious ideology as well. The breaking of any laws can result in imprisonment for two to five years, depending on the severity.

Issues

Maldivians face increasing poverty, drug abuse, decreasing democracy, and restrictive religious freedom among the population, and a number of government officials have committed criminal acts. Additional problems relating

to climate change include low elevation, threatening sea-level rises affecting fishing, depletion of freshwater, global warming, coral reef bleaching, and effects from the tsunami in 2004 (CIA 2015).

Global Issues

Maldives is known for its white-sand beaches and extensive coral reefs. It does not maintain ground surface higher than 10 feet (3 meters) above sea level. This makes Maldives and its atolls the flattest country on earth and susceptible to rising sea levels and coastal flooding (UCS 2011). The Ministry of Environment and Energy has aided the country in adapting to rising seas, especially after the tsunami in 2004. Some of these measures include protecting valuable groundwater and increasing rainwater harvesting. Finally, the increasing elevation of critical infrastructure has greatly affected schools, government buildings, and public buildings commonly used in times of crisis (Ministry of Environment and Energy 2016).

Water Resources

Freshwater resources are extremely limited on Maldives. Maldives' northeast and southwest monsoon seasons from November to September supply the atolls with an average rainfall of 75 inches (1,900 mm) annually. The freshwater supply is scarce, particularly in rural areas. According to the Maldives Water and Sanitation Authority (MWSA), finding suitable drinking water is challenging. Groundwater is continually replenished by the rain; however, when it infiltrates the soil, it becomes contaminated by human waste and organic products (FAO 2009).

Rainwater is collected from rooftops and stored in different types of containers in rural areas. Within Malé, people use purified water for drinking, cooking, bathing, and daily uses. Groundwater is used for restrooms and outdoor purposes. Additionally, those with limited finances collect rainwater and tap into bays around the island (FAO 2009).

Violence, Domestic Abuse, and Human Trafficking

Women of all ages in Maldives face violence in many forms and in many arenas: at home, in public, in the workplace, and in the community. In 1993, Maldives signed the Convention for the Elimination of All Forms of Discrimination against Women (CEDAW), committing to its implementation. With the aid of UNICEF, television programs have discussed issues of violence, abuse, and human trafficking

of children, young women, and older women. These crimes are challenging to prove because of religious ideologies that consider women and children to be property (shariah law). In 2008, violence against women steadily increased, especially against young women. In 2011, 261 cases of violence against children and young women were reported, but the police estimate there were several hundred to thousands more unreported (UNICEF 2015).

UNICEF is working with the government and social workers to raise awareness and establish a child abuse prevention program under the Ministry of State for Gender, Family and Human Rights. It is a three-year program to protect children, both in school and at home. The program trains social workers about how to address child abuse in a timely manner, which may include (a) placing children or young women in 1 of the 10 Family and Child Service Centres established by the Ministry of Gender and Family, (b) assisting families in overcoming drug abuse and family breakdowns, and (c) setting up direct counseling for individuals and families. Social workers in Maldives are frequently the most able to assist in emergencies (UNICEF 2015).

Maldives has made considerable improvements and shown support for the Millennium Development Goals (MDG) by providing adequate health and wellness, improving education to those in outside atolls, and finding solutions to poverty and hunger, especially in newborns and young children. With the assistance of WHO and UNICEF, Maldives has and will continue to combat malaria, leprosy, dengue fevers, diarrheal diseases, and acute respiratory infections (WHO 2016). The country continues to search for and improve island conditions, such as thermal conditions, shortages of freshwater, and additional problems with its second major industry, fishing, all of which will contribute to improving the conditions of women's lives.

Melanesia

Overview of Region

Melanesia is a region in Oceania; the Andesite Line, a geological feature of extreme volcanic and seismic activity, separates Melanesia from Polynesia in the east and from Micronesia to the north. Melanesia derives from the Greek *melas* (black) and *nesoi* (islands) due to the dark skin of its inhabitants (Kahn and Keesing 2016). Melanesia is made up of several island countries; countries within Oceania are generally referred to as Pacific Island countries (PICs). Vanuatu was jointly managed by France and the United Kingdom for almost a century before becoming independent in 1980. The Solomon Island chain includes the countries of Papua New Guinea and the Solomon Islands, the latter formerly a protectorate of the United Kingdom. The island of New Guinea is politically divided; the western half is an Indonesian province called Irian Jaya, and the eastern half is the independent nation of Papua New Guinea (PNG). Fiji was a crown colony of the United Kingdom from 1874 until gaining independence in 1970. Additionally, Melanesian contains New Caledonia (collectivity of France) and the Maluku Islands (Indonesia) (Countries and Their Cultures 2016).

Historically, Melanesia was a "meeting ground of two cultural traditions and populations: Papuans and Austro-nesians" (Kahn and Keesing 2016, para. 11). Evidence of the Papuans dates back at least 40,000 years. Papuans were hunter-gathers who had adapted to the tropical rain forest and inhabited the landmass, which became modern New Guinea. Pottery, tools, and shell ornaments distinctive of the Lapita culture provide evidence of their presence in this

region. Papuan descendants all speak languages belonging to several families, all categorized as Papuan languages. Papuans spoke a language related to those spoken in the Philippines and Indonesia. These long-distance sea travelers eventually spread to Polynesia and Micronesia.

Austronesians (Lapita) were expert sailors and navigators. They were governed by a hereditary chief system, and these chiefs possessed both political and religious authority. The religious systems practiced were complex and had commonalities with those practiced in western Polynesia. The Papuans inhabited the Bismarck Archipelago (east of New Guinea) when the Austronesians first arrived there. There is evidence of economic exchange between Austronesians and Papuans; therefore, genetic and cultural exchanges were also likely. Contemporary Melanesian people and cultures are likely the result of such exchanges (Kahn and Keesing 2016).

Europeans began colonizing Melanesia in 1660, when the Dutch assumed sovereignty over New Guinea. Over the following centuries, the United Kingdom, the Netherlands, Australia, Germany, and Japan all established colonies that disrupted traditional trade systems, intensified existing intercommunity warfare, reduced populations due to introduction of new diseases and indentured servitude, and eroded traditional systems of leadership and authority; such disruptions continue to have impacts on modern Melanesian societies. Due to the remoteness of some areas (i.e., the interior highlands of New Guinea), Western influence came to some Melanesian societies as late as the 1950s (Kahn and Keesing 2016).

Not all Melanesian islands are independent nations, nor do they all have comprehensive systems for collecting and reporting data; therefore, indicators and statistics are not available and reported for each. In 2015, Vanuatu had a Gender Development Index (GDI) of 0.903. Fiji had a 2015 GDI of 0.941 and a Gender Inequality Index (GII) of 0.418. PNG had a 2015 GII of 0.611 (UNDP 2016a, 2016b, 2016c). In 2015, Fiji ranked 121st out of 145 countries with a Global Gender Gap Index of 0.645 (World Economic Forum 2015). By international standards, women in the Pacific face significant gender inequality (AusAID 2011).

Girls and Teens

In PICs, children generally have the lowest social status; due to the relatively high gender inequality in Melanesian societies, young girls are typically at the bottom of the social hierarchy. Therefore, girls are socialized to have a sense of inferiority, resulting in a lack of development of

opinions or choices; in many areas, Melanesian girls are taught to never question male authority (Ali 2006).

Early, Forced, and Custom Marriages

Most Melanesian countries allow marriage for girls between 14 and 16 years old with parental consent and for boys between 16 and 18 years old. Early marriage can have detrimental, long-lasting effects upon girls' education, health, and physical and emotional well-being (Morales 2015). Both forced and early marriage are often associated with each other. Women at or above the legal age of consent are also often forced to wed. Customary marriage is still widely practiced in many Melanesian communities, and due to the remoteness of many communities, there is often no legal protection for young boys or girls marrying by custom. A custom marriage may have no legal requirements, but traditional practices will likely take place so that the marriage will be accepted and recognized within the tribe or community (e.g., payment of bride-price, feasting). In some parts of Melanesia, customary law allows girls to be married at puberty, as young as 12–13 years old (Ali 2006; Morales 2015). In Fiji, about 27 percent of Muslims enter into *nikah* without legalizing their marriages. In 1994, almost 20 percent of Indo-Fijian girls were removed from school between the ages of 15 and 16 years old and forced into arranged marriages, often to overseas nationals in the hope of securing a better life overseas. In some parts of Vanuatu, it is customary for a murderer's family to give the victim's family a girl child for the purposes of marriage as amends. Where large-scale logging industries have developed, a new form of customary marriage has arisen. In the Solomon Islands, girls as young as 11 and 12 years old are sometimes forced to marry loggers (often foreign and much older) because parents can demand a significant bride-price. When these "logging brides" become pregnant, their husbands often leave, moving on to another logging camp to repeat the practice (Jalal 2009).

Custom marriage can be overruled when it violates legal minimum marrying age, but it is rarely challenged in courts. The legal pluralism that allows customary law to exist alongside formal, conventional legal systems makes protecting young women difficult. For example, customary law in Solomon Islands has constitutional status. Many Melanesians are unaware of the existence of laws governing the minimum age of consent. Additionally, births and marriages are often not officially registered. Only around 2 percent of births in PNG and 15 percent in the Solomon Islands are ever legally registered, leaving no possibility for verifying the ages of these individuals (Jalal 2009).

Presently, only civil remedies are available to custom wives. Such provisions may allow for annulment if a marriage is forced, but most women married by force or custom simply accept this fate and fail to ever pursue annulment. Melanesian family laws are heavily in favor of men, leaving women who obtain a divorce or annulment incapable of retaining custody of their children, spousal financial support, or any property. This provides women little incentive to pursue either option (Jalal 2009).

Bride-Price

Bride-price, a documented traditional practice in all Melanesian countries except Fiji, is a method of payment by a groom or his family to the parents of the woman he has just married or is about to marry. Historically, bride-price was an exchange of gifts between families or clans so that an alliance between the groups was secured. A bride-price ceremony is a public demonstration of marriage and establishes new ties between families, relatives, and clans. Also, bride-price appropriates the notion that the bride is considered lost to her own family or clan (Maebuta 2012).

Modern bride-price can include money, pigs, cows, cassowaries, chickens, coffee machines, vehicles, outboard motors, garden tools, or food (Bre 2006). In resource-rich areas, such as the PNG highlands, extremely high bride-prices are paid, and even men of modest means are expected to pay a woman's family in pigs and money valuing USD\$5,000–USD\$10,000. This amount may escalate to as much as USD\$100,000 and include vehicles when either party in the couple is university educated or well-placed in society. PNG bride-prices are particularly high near rich mining districts and the capital city of Port Moresby. In the Simbu province of PNG, bride-price is paid throughout the marriage (Maebuta 2012). These practices represent some extremes; for most PNG couples, if a bride-price is paid, it amounts to around a dozen pigs, some domestic goods, and a modest sum of money.

Modern influences on traditional bride-price practices have drawn criticism. Families begin preparing in advance for a marriage, as it can take several years to raise pigs, save money, and plant gardens to afford bride-price and a marriage celebration. Bre (2006) argues that if the PNG bride-price system were eliminated, most Papua New Guineans would be wealthy. Bre puts forth that continuing the practice is simply a manifestation of greed justified by tradition, as money was only introduced to Melanesia after European colonization. High bride-prices are prohibitive

to marriage for some couples; in response, the Vanuatu National Council of Chiefs banned cash from bride-price payments in 2012. This ban allows the cultural tradition of bride-price to continue, but only with traditional currencies such as woven mats, pigs, and shell money (ABC Radio Australia 2012).

Some customary practices (e.g., bride-price) remain as hostile responses to Melanesian women's growing assertiveness and evolving societal roles. In this manner, culture and custom are invoked to justify violent treatment of women. Because they are typically "hazy manifestations" (Jalal 2009, 5) of original customs distorted to suit community or family convenience, the practices are accepted by society. Some PNG fathers use the tradition of bride-price to justify trading daughters for cash or goods from transient logging and mining workers, invoking the monetary gain elements of the practice while ignoring others. This practice is considered a form of child trafficking by some who claim these young girls are simply being bought for labor and sex (Laqeretabua et al. 2009). Additionally, some PNG communities that never practiced bride-price have recently adopted it as a means for demanding cash for a daughter.

Bride-price is a significant factor in perpetuating domestic violence, as it demotes women to the status of property (Ali 2006). Bride-price is used to secure custody rights to children after separation or divorce; husbands retain children as repayment for loss of the wife they paid for. Many Melanesians believe bride-price gives men the right to control their wives, even through violence. A husband's use of violence against his wife is typically only questioned if he beats her excessively, when he's drunk, or for no reason. Bride-price is widely recognized as a legal defense to prosecution against domestic violence; if prosecution is successful, bride-price may lead to a penalty reduction. However, Vanuatu's Family Protection Act of 2008 made domestic violence illegal and specified that payment of bride-price could not be utilized as a defense in such cases (Jalal 2009).

Education

Many Melanesian countries face similar barriers to education: limited access, funding, resources, and quality. Some countries do not have compulsory education, resulting in limitations to workforce and quality of life development. Because most Melanesian countries have unbalanced population structures, there are limited opportunities for

students wishing to pursue education beyond basic primary education.

Preprimary and Primary Education

Primary education is available in Vanuatu, except for some remote areas; the academic year begins in February and ends in December. The number of schools varies annually; 44.2 percent are on customary land, 27 percent are government-owned, and 12 percent are owned by other agencies (Natuman and Lamoureux 2006). The official primary school entrance age is six years, and the primary school cycle lasts for six years. The gross enrollment ratio (GER) for preprimary school is 61.2 percent; this accounts for 14,301 students enrolled in 576 schools. The GER for primary schools is 122.5 percent; this accounts for 45,931 students enrolled in 433 schools. The primary school completion rate is 84 percent, and the dropout rate is 28.5 percent.

Typically, students drop out because they cannot afford school fees. Primary school is subsidized, but with 80 percent of the population living off subsistence farming, even reduced fees are prohibitive (Mackey 2014). Repetition rates for the first five grades of primary school range from 20.8 percent to 8.8 percent; repetition rates are higher for boys for each grade. The pupil-to-teacher ratio for preprimary school is 16:1, and for primary school it is 25:1; 100 percent of primary school teachers are properly trained. Vanuatu spends 5 percent of gross domestic product (GDP) on education; it ranks at the 97th percentile in access and the 49th percentile in learning. The youth literacy rate is 95 percent; this is much higher than in other lower middle-income countries (EDPC 2014b; Government of Vanuatu 2016; UNDP 2016d).

Fijian law requires that all children have access to education. In 2013, Fiji began offering free primary and secondary education (RNZ 2013). Instruction may be in any one of Fiji's three official languages (none of which most children likely speak at home), and even teachers within the same school may utilize different languages for instruction, presenting a significant barrier to learning. The six-year primary cycle is not compulsory. In Fiji, the GER is 17.8 percent for preprimary education and 104.6 percent for primary education. The dropout rate is 3.5 percent.

There are approximately 700 public and private primary schools. The pupil-to-teacher ratio in primary school is 28:1, and 100 percent of primary teachers are properly trained. Village schools are typically one room, with a single teacher for about 20 students; in towns, classes are

larger, and ratios can be 50:1. About 20 percent of village children miss out on a primary education due to poverty. Fiji spends 4.2 percent of GDP on education (Go-Fiji.com 2016; UNDP 2016a); this has steadily decreased since 2008. The majority of Fijian schools operate as partnerships between community- or religious-based organizations and the Ministry of Education. Government funding barely covers per pupil expenses, leaving no funding for maintenance (Water Charity 2017).

Basic education is free (as of 2013) and compulsory in PNG for students ages 6–14 years; preschool is not compulsory. In PNG, the GER for preprimary school is 99.8 percent, and for primary school, it is 114.2 percent (UNDP 2016b). GERs for boys are higher than for girls at both the preprimary (101% versus 98.5%) and primary (63.4% versus 56.5%) levels. Children mainly fail to attend school due to the distance to school, security, and a lack of parental support (UNICEF 2013). Children begin elementary school at age six and move on to a six-year primary school cycle at age nine, during which they begin a bilingual program to learn English. Primary school consists of both lower (grades 3–5) and upper (grades 6–8) grades (PNGNRI 2017). Only one-third of children complete basic education; completion rates are worse in rural areas. Most rural schools lack toilets and adequate clean water, posing serious health hazards. Adolescent girls suffer the most, because without clean, private changing rooms with soap, water, or sanitary pads, girls are frequently sent home for days at a time (UNICEF 2013).

The Solomon Islands' academic year begins in January and ends in December. Education is not compulsory, but it is free at the primary level. The primary cycle lasts six years. Only about 60 percent of school-age children have access to primary education and of this number only 72 percent complete primary education. Because resources are so little, students must successfully pass an exam in order to enroll in secondary school. Efforts to expand educational facilities and increase enrollment are inhibited by a lack of funding and classroom materials, poor teacher preparation, poor coordination, and the failure to pay teachers. Less than half of schools have adequate drinking water and sanitation (Binns 2015).

In the Solomon Islands, the preprimary GER is 43.4 percent, and the primary is 114.4 percent. The dropout rate is 25.1 percent; only 72 percent of children complete the full primary cycle. Repetition rates for grades 1–5 range from 9.1 percent to 6.2 percent and are higher for boys in every grade except third. About 19 percent of primary

school-aged children are out of school—18 percent of boys and 21 percent of girls (EDPC 2014a). The pupil-to-primary teacher ratio is 20.6:1, and 63.3 percent of primary school teachers are properly trained (UNDP 2016c). Government expenditures on education have dropped from 9.7 percent in 1998 to 2.2 percent in 2015 (Binns 2015). Solomon Islands ranks in the 16th percentile for access and the 35th percentile for learning compared to other low- to middle-income countries. The youth literacy rate is 85 percent, lower than the average in other lower- to middle-income countries (EDPC 2014a).

Secondary and Vocational Education

In Fiji, the GER for secondary education is 88.3 percent, and for tertiary education, it is 16.1 percent. The mean years of schooling is 9.9 years, and 64.3 percent of the population over 25 years of age has at least some secondary education; full secondary education consists of four years. Poverty, school fees, child labor practices, poor education quality, distance from schools, and the HIV pandemic are some of the reasons why Fiji's children do not all receive a complete, high-quality education. Only 55 percent of children from the poorest third of the population reach upper secondary school, compared to 73 percent from the richest third. Only 27 percent of children from the poorest third reach tertiary education, compared to 40 percent from the richest third (EI 2013). Private schools offer higher quality; however, the few private schools are too expensive for many (Go-Fiji.com 2016). Higher education is offered by a number of universities and colleges (SpainExchange 2016b; UNDP 2016a).

In Vanuatu, the secondary school GER is 59.5 percent; this accounts for 20,568 students enrolled in 96 schools. Only 20–25 percent of graduating primary students move on to secondary school, mainly due to school fees. Additionally, students must perform in the top of their class according to nationwide exams to qualify for secondary education. Because about 66 percent of Vanuatu's population is under 24 years old, there is insufficient secondary school infrastructure to accommodate all students. Lower secondary school lasts four years, and upper secondary is three years. The pupil-to-teacher ratio is 21:1. The GER for tertiary education is 4.7 percent. The mean years of schooling is 6.8, and the adult literacy rate is 83.4 percent; most literate adults are under age 35 (EPDC 2014a; Government of Vanuatu 2016; UNDP 2016d). Attendance and enrollment are the lowest in the Pacific, largely because school

is not compulsory. Vanuatu has some vocational training centers; most are poorly built and frequently destroyed by cyclones. Oxfam operates 50 such centers that offer training in business management, health care, agriculture, carpentry, home skills, and mechanics. The University of the South Pacific is in Port Vila and has three branch campuses (Mackey 2014; SpainExchange 2016a).

In PNG, the secondary GER is 40.2 percent, and 11.1 percent of the population 25 years or older has some secondary education. The mean years of education is four, and the adult literacy rate is 62.9 percent (UNDP 2016b). Students who complete primary schooling may matriculate to secondary school for grades 9–12. Vocational education is available for students who have completed eighth grade. Higher education is provided by several universities, colleges, and specialized training institutes (PNGNRI 2017).

In Solomon Islands, the lower secondary cycle last three years, and upper secondary lasts four. The secondary GER is 48.4 percent, and the mean number of years of schooling is five (UNDP 2016c). The student transition rate to secondary school is 86 percent (EDPC 2014a). Because resources are limited, students must pass an examination to secure a seat in secondary school. The adult illiteracy rate is 75 percent. As most adults have no educational background, the main source of income is through farming. Many children remain at home to work at the family farm rather than attend school. These poor educational results are due to a slow recovery from the civil war of 1998–2003 and the tsunami in 2007. Teachers, schools, and classroom materials are in short supply and of poor quality. About 50 percent of teachers are underqualified, and less than 50 percent of schools have adequate drinking water (Binns 2015). The University of the South Pacific and the University of Papua New Guinea have campuses in the Solomon Islands.

Health

Health care in Melanesia is a mix of private and publicly provided facilities. There is a lack of adequate access to even basic primary health care in many areas, and many countries must rely on international referral agreements for tertiary care.

Access to Health Care

In Fiji, the life expectancy in 2015 was 72.4 years—69.8 years for men and 75.2 years for women. About 4.1 percent of the 2013 GDP was spent on health care. In 2009,

Fiji had 0.43 physicians and two hospital beds per 1,000 people (CIA 2016a). In New Caledonia, the 2015 life expectancy was 77.5 years, 73.5 years for men and 81.7 years for women (CIA 2016b). In PNG, the 2015 life expectancy was 67 years; 64.8 years for men and 69.4 years for women. About 4.5 percent of the 2013 GDP was spent on health care. In 2008, there were 0.06 physicians per 1,000 people (CIA 2016c). In the Solomon Islands, 5.1 percent of the 2013 GDP was spent on health care. In 2008, there were 0.22 physicians per 1,000 people, and in 2012, there were 1.3 hospital beds per 1,000 people (CIA 2016d). Life expectancy in Vanuatu in 2015 was 73 years; 71.5 years for men and 74.7 years for women. About 3.9 percent of the 2013 GDP was spent on health care. In 2008, Vanuatu had 0.12 physicians and 1.8 hospital beds per 1,000 people (CIA 2016e).

Maternal Health

In 2015, in Fiji, 2.47 children were born per woman. The maternal mortality rate was 30 deaths per 100,000 live births. The infant mortality rate was 9.94 deaths per 1,000 live births (CIA 2016a). In New Caledonia, 1.97 children were born per woman in 2015. The infant mortality was 5.37 deaths per 1,000 live births (CIA 2016b). In PNG, 3.16 children were born per woman in 2015. The maternal mortality rate was 215 deaths per 100,000 live births. The infant mortality rate was 38.6 deaths per 1,000 live births. The 2007 contraceptive prevalence rate was 32.4 percent (CIA 2016c). In Solomon Islands, the median age at first birth was 21.6 years, and there were 3.28 children born per woman in 2015. The maternal mortality rate was 114 deaths per 100,000 live births. Infant mortality was 15.65 deaths per 1,000 live births. In 2007, the contraceptive prevalence rate was 34.6 percent (CIA 2016d). In 2015, in Vanuatu, there were 3.25 children born per woman. The maternal mortality rate was 78 deaths per 100,000 live births. The infant mortality rate was 15.7 deaths per 1,000 live births. The 2007 contraceptive prevalence rate was 38.4 percent (CIA 2016e).

Women and girls have little to no access to reproductive health education in Melanesia. Only very rarely is any reproductive health education delivered in schools. This is because cultural taboos surrounding sexual topics exist, and beliefs that reproductive health education encourages youth sexual experimentation are widespread. The absence of education on reproductive health and empowerment training for girls results in higher risks of child

pregnancy, contracting sexually transmitted diseases, and sexual abuse and exploitation (Ali 2006).

Diseases and Disorders

In Melanesia, rates of HIV infection are among the highest in the PICs, mainly due to the epidemic in PNG. In 2004, 90 percent of HIV infections in the Pacific were reported in PNG (Oxfam 2010). There are also high levels of other sexually transmitted diseases. The primary avenue of infection of HIV and other STDs is through heterosexual coitus. Condoms and other forms of protection are not widely utilized in Melanesia; such items are not readily available, and public discourse and religious values discourage their use. HIV and how it spreads are poorly understood throughout Melanesia. Women are particularly vulnerable to HIV infection due to the high rates of gender-based violence in Melanesia; women lack the ability to negotiate sex and protect themselves. Very few HIV-infected individuals receive treatment, and because people tend to be diagnosed late in the disease process, treatment (if received) is rarely effective. This leads to an almost 100 percent fatality rate, creating widespread fear and social stigma associated with HIV/AIDS (Butt and Eves 2008; Caldwell and Isaac-Toua 2002; Oxfam 2006, 2010).

People living in PNG, Fiji, Vanuatu, and the Solomon Islands experience high risks of neglected tropical diseases (NTDs). NTDs are the most common infections of the “the bottom billion,” the world’s poorest people, and can adversely affect economic productivity, pregnancy and childbirth, and children’s physical and cognitive development. Melanesians are at high risk for hookworm, strongyloidiasis, lymphatic filariasis (LF), balantidiasis, yaws, trachoma, leprosy, and scabies. PNG has the largest number of cases and highest prevalence for most of these NTDs as well as outbreaks of cholera and malaria.

Of note, LF remains widespread in PNG despite programs of mass drug administration through the Pacific Programme to Eliminate Lymphatic Filariasis (PacELF), which has made enormous strides in reducing LF in Fiji and New Caledonia, possibly eliminating LF in Vanuatu. LF had previously been eliminated in the Solomon Islands through vector control methods. Malaria is endemic in the Solomon Islands, Vanuatu, and in regions of PNG. The Pacific Malaria Initiative Support Centre (PacMISC) and the Global Fund have begun promising programs aimed at reducing mosquito-borne diseases in these countries. Within the next decade, epidemiologists are concerned

that dengue, Ross River virus, and Japanese encephalitis could become important NTDs (Kline et al. 2013).

Replacing traditional foods with imported processed foods has caused numerous health problems. The prevalence of adult-onset diabetes in the Pacific region is one of the highest in the world. Micronutrient deficiencies are also common; in 94 percent of PICs surveyed, more than 20 percent of children and pregnant women were anemic. In Fiji, PNG, and Vanuatu, iodine deficiency and related goiter are endemic; Fiji and PNG introduced salt iodization and are seeing good results. Vitamin A deficiency is also high in PNG; lack of adequate vitamin A can cause xerophthalmia (the inability to see in low light) in young children and pregnant women, which can lead to blindness if left untreated. About 40 percent of Pacific Islanders have a noncommunicable disease, such as cardiovascular disease, diabetes, or hypertension. These diseases account for 75 percent of deaths across the Pacific archipelago and 40–60 percent of health care expenditures (WHO 2010).

Employment

Among Oceania's approximately 35 million people, the greatest number living in poverty reside in PNG, Fiji, Vanuatu, and the Solomon Islands, all Melanesian nations (Kline et al. 2013). Great gender disparities in education and employment limit growth within the region.

Female Labor Participation

Melanesia's average loss in potential human development due to gender inequality is about 70 percent. However, it has the largest disparity between countries of any other region. Gender inequality is about 80 percent in the Solomon Islands and PNG due to large disparities in educational attainment, political representation, and high maternal mortality rates. Fiji maintains the region's smallest loss due to gender inequality (about 50%). Average female labor force participation rates are significantly lower than men in Melanesia; 53 percent compared to 73 percent, respectively (AusAID 2011). Even so, the East Asia and Pacific region has the highest average female labor participation rate and highest ratio of female-to-male labor force participation in the Global South. Female labor force participation rates vary in Melanesia, from over 75 percent in Vanuatu to as low as 40 percent for Fiji; however, even those countries with low rates reported female labor participation increases.

Agriculture remains the largest sector of employment, mainly small-scale subsistence farming. Women are more likely than men to perform unpaid family labor in agriculture and the informal market. Additionally, women are more likely to be teachers, nurses, temporary workers, or to work in textiles, food, or other export-oriented firms. Female-led businesses tend to be smaller and more precarious than male-led businesses; they are also more likely to operate in the informal market. Such businesses tend to have fewer employees, command lower profits, be less capitalized, and be located in less remunerative sectors, such as food, retail, and garment-manufacturing sectors. Women tend to undertake the majority of household and child care work, in addition to market work, due to longstanding gender norms regarding division of labor. Melanesian tradition limits female economic opportunities, and women tend to work longer hours and earn less than men (World Bank 2012).

Family Life

Melanesian societies are highly patriarchal, and a great deal of antagonism exists between men and women. Traditionally, villages have separate residences for men and women. For example, in the PNG's Sepik River region, male ceremonial houses are off-limits to women and children, who live in smaller domestic dwellings. This is one extreme. In smaller societies, there may be communal residences; however, domestic space is still typically divided between males and females. Women serve as primary caregivers for children and are the primary food producers (Countries and Their Cultures 2016; Kahn and Keesing 2016).

Violence against Women

Modern Melanesian women increasingly desire to participate in the formal economy and gain more agency. This poses significant challenges to Melanesian men, who are said to be experiencing a "crisis of masculinity" due to evolving societal roles. This "crisis" is often cited as a cause of violence against women (VAW). VAW is the gender issue of greatest concern in Melanesia because some of the highest incidences of VAW in the world occur there (AusAID 2011 UNIFEM 2010). VAW includes sexual violence, physical violence, forced marriage, and payback rape, and it primarily stems from the gender inequality normalized across much of Melanesia.

Customary law and a long history of patriarchy play huge roles in sanctioning harmful practices against Melanesian

women and girls. Domestic violence is frequently viewed as legitimate spousal “discipline” and is often validated by the practice of bride-price (Rasanathan and Bhushan 2011). In the Solomon Islands, 73 percent of men and women believe that VAW is justifiable when women disobey, are unfaithful, or do not live up to societal expectations (Rasanathan and Bhushan 2011). Most VAW goes unreported due to a cultural taboo against speaking about such acts (Morioka 2013).

In the Solomon Islands, 64 percent of women 15–49 years old have been victims of VAW committed by their partners. About 18 percent of women have experienced nonpartner violence. Most VAW in the Islands is sexual (Lewis 2012), and 37 percent of women have experienced sexual abuse prior to age 15 (Rasanathan and Bhushan 2011). VAW is especially acute in PNG, where many agencies describe the problem as “endemic” (Eves 2012, 1). A PNG survey discovered that 67 percent of all wives interviewed—and alarmingly 100 percent of highland wives interviewed—had been physically abused by their husbands. Additionally, about 50 percent of married women reported being forced into sex by their husbands. About 80–90 percent of injuries presented by women in health care facilities are the result of VAW (AusAID 2008; Amnesty International 2006). Sexual violence has reached epidemic levels in PNG, where gang rape, payback rape, rape due to tribal disputes, and rape of suspected witches are all commonplace. In some parts of PNG, the fear of sexual violence, especially rape, severely restricts women’s freedom of movement (AusAID 2008; Amnesty International 2006). In PNG, 60 percent of men admitted to being involved in gang rape at least once (AusAID 2008; Morioka 2013; UNIFEM 2010).

In 2002, VAW was formally recognized as a criminal offense in PNG. VAW is a crime under the Solomon Islands Penal Code (Morioka 2013); however, domestic violence has not been criminalized (Lewis 2012). In 2009, Vanuatu passed the Family Protection Act after over a decade of pressure from women’s rights activists. In 2009, Fiji improved the legal framework for prosecuting sexual and domestic violence. Such recent actions are promising; however, great need exists for much stronger legal and judicial measures. The judicial and police response to VAW regionally has remained relatively unchanged in comparison to legislative actions (ICRW 2012).

Politics

Melanesian women have relatively low levels of representation in national and local leadership. Women make up

about 19 percent of national parliamentarians globally, and 18 percent in East Asian and Pacific countries. This representation has not increased with economic development and growth, barely changing since the 1990s. This is in stark contrast to other Global South nations where women’s political representation has risen (World Bank 2012).

Women in Leadership

The number of PIC women in national parliaments varies greatly. However, Melanesian female political representation is among the lowest in the world. In 2011, half of the countries in the world lacking women parliamentarians were located in Oceania. Solomon Islands was one (World Bank 2012). In Fiji, 14 percent of parliamentary seats are held by women. This percentage drops to 2.7 percent in PNG, 2 percent in Solomon Islands, and 0.1 percent in Vanuatu (UNDP 2016a, 2016b, 2016c, 2016d). Traditional gender roles present a consistent barrier to increasing the involvement of women in national and local political leadership.

Some Melanesian women are experiencing leadership success in civil society and grassroots movements. In 2012, the Fiji Women’s Crisis Center lobbied for a national survey to quantitatively measure VAW. This organization is known for a human rights and gender transformative approach for addressing women’s issues in Fiji. They carry out regular trainings for various actors engaged in preventing and responding to VAW (ICRW 2012). Similar efforts in Vanuatu and PNG have seen benefits. More grassroots successes should positively affect the public’s perception of female leadership. More exposure to women leaders and elected officials can have positive influence on perceptions of women’s leadership. However, such change can be slow (World Bank 2012).

LGBT Rights

LGBT rights across Melanesia are limited, with the exception of New Caledonia. In New Caledonia, same-sex sexual activity, same-sex civil unions and marriages, adoption by same-sex couples, and military service by LGBT individuals are legal. Antidiscrimination laws are in place banning antigay discrimination. Gender transition is permitted; however, sterilization is required for those undergoing a medical sex change. In Fiji, same-sex sexual activity was legalized in 2010, and there are some antidiscrimination laws that protect LGBT individuals; however, LGBT individuals may not enter civil unions, marry, or adopt

children. In PNG, male homosexual activity is illegal and carries a penalty of 3–14 years of imprisonment, but this is rarely enforced. Female homosexual activity has always been legal. In PNG, LGBT individuals cannot enter civil unions, marry, adopt children, serve in the military, or transition gender, and there are no laws protecting LGBT individuals from discrimination. In Vanuatu, same-sex sexual activity has been legal since 2007. However, LGBT individuals enjoy no other rights, nor are they protected by antidiscrimination laws. Same-sex sexual activity is illegal in the Solomon Islands, carrying a penalty of up to 14 years' imprisonment. Additionally, LGBT individuals have no other rights, nor are they protected by antidiscrimination laws (Carroll and IGLA 2016). In fact, the latest constitutional draft permits discrimination and even violence related to sexual orientation (Verheyen 2016).

Religious and Cultural Roles

Christianity spread throughout Melanesia due to active missionaries and remains one of the “most successful and entrenched cultural legacies of the European expansion into the Pacific” (Eves, 2012, 3). The success experienced by missionaries and the indigenous churches that developed from their work is reflected in the significant numbers of Melanesians who identify as Christian.

Influence of Christianity

Christianity has exerted powerful change since the late 1800s. Missionaries and colonial rule eliminated a variety of cultural traditions and traditional religious practices. Many Melanesian leaders were educated in mission schools; some trained as Christian ministers. The result is that postcolonial Melanesia is among the most Christian regions on the planet (Kahn and Keesing 2016). Christianity has a “pervasive influence in daily life and is central to the framework through which people make sense of the world” (Eves 2012, 3). Christian language is found within public discourse, and civil society is dominated by Christian faith-based groups. Christianity is represented in constitutions, and there is a Christian church in nearly every community. And church leaders are often revered more than government leaders.

In Fiji, 45 percent of the population is Protestant (mainly Methodist); 27.9 percent is Hindu; 9.1 percent is Roman Catholic; and the remainder is Muslim, Sikh, or other Christian. In Vanuatu, 70 percent of the population is

Protestant (the largest denomination being Presbyterian); 12.4 percent is Roman Catholic; and 3.7 percent practices traditional religion. The people of the Solomon Islands are 73.4 percent Protestant (the Church of Melanesia is the largest denomination at 31.9%), and 19.6 percent are Roman Catholic. PNG's people are 69.4 percent Protestant (Evangelical Lutherans are the largest denomination at 19.5%); 27 percent are Roman Catholic; and 3.6 percent practice Baha'i or traditional religions. In New Caledonia, 60 percent of the population is Roman Catholic, and 30 percent is Protestant (CIA 2016a, 2016b, 2016c, 2016d, 2016e).

The Role of Churches in Gender Relations

The first missionaries employed a distinctly gendered approach in efforts to establish churches and influence Melanesian society and culture. They attempted to “civilize” Melanesia by instilling European standards and values of “appropriate” conduct for both men and women. Male violence was discouraged, but missionaries also attempted to domesticate women, whom they considered unruly. “Missionaries endeavored to reform gender by cultivating new and different forms of masculinity and femininity,” and such efforts did not ultimately “displace traditional notions of gender hierarchy, but merely reinscribed them in a different form” (Eves 2012, 3). Church leadership was exclusively the role of men, and this continues today.

Recognizing their significant place in modern Melanesian culture, many churches are attempting to address some of the societal problems facing Melanesia. Many churches play significant roles in the delivery of health, education, and social services and through such efforts are attempting to address the problems of gender violence and inequality. Because churches often hold the greatest authority in a community, some of these efforts are seeing success. For example, the Pacific Conference of Churches has conducted training to advance attitude change among Melanesian clergy about gendered roles within marriage. Similarly, the Solomon Islands Christian Association has conducted training with clergy and community members on gender and the link between inequality and violence (ICRW 2012).

Some Evangelical churches are making positive impacts on issues of domestic violence through teaching a New Testament ethos of care and compassion and spreading a desire for harmonious community relations. In PNG, the Catholic Church is at the forefront of church response to domestic violence. Church leaders declared that marriage

must be a free contract between equals, that violence has no place in a marriage, that payment of bride-price does not give husbands the right to beat wives, and that parishes were to offer protective action plans in situations of domestic violence.

The Catholic Church in PNG still views the man as head of the family; this familial hierarchy has influenced the formation of some men's groups (male equivalents of the Catholic Women's Federation). Such groups are referred to as "Papa Groups," and they have organized in several provinces to address issues of domestic violence. However, rather than working toward creating more equitable relationships with women, most Papa Groups have asserted themselves as affirmations of male authority in "organizing, disciplining, and bringing family members into line" (Eves 2012, 4). Women's church groups also frequently adopt this traditional family model, teaching wives to obey, submit to, and not ever challenge husbands to prevent domestic violence.

Issues

Modern Melanesia faces many challenges, some of which have been discussed above. Melanesian women face multiple gendered barriers to achieving more agency over their own lives, and many such barriers are violent ones. Another form of violence is that against those accused of witchcraft and sorcery. "Black magic" is believed by many Melanesians to be real, and those accused of its practice can face violent torture and death. Such sorcery-related violence is often directed at women.

Witchcraft and Sorcery

Belief in sorcery and witchcraft has a long history in Melanesian societies, and rather than dying out, it is widespread, increasing, and spreading to areas where historically the people did not share such beliefs. These entrenched beliefs in witchcraft in PNG, Vanuatu, and the Solomon Islands have become commonly accepted explanations for any unusual occurrence, sickness, death, or misfortune. Historically, people believed to be witches were killed in secret, often by relatives. In modern Melanesia, witchcraft-related attacks have become public and are often associated with prolonged physical and sometimes sexualized torture of accused victims. While both men and women are victims of such attacks, women are the more common targets of sorcery- and witchcraft-fueled violence (Forsyth 2013).

The traditional belief in witchcraft is used to justify heinous violent acts. In PNG, women are more likely to be accused of witchcraft than men and are more likely to become victims of violence (Gibbs 2012). Sorcery-related violence and killings are not uncommon. The accused are usually economically dependent older women who lack family to support them; as such, they are viewed as burdens on their tribes (Jalal 2009). Perpetrators are usually young men frustrated with the inability to find a community role for themselves; killing the "village witch" may elevate them to hero status (Forsyth 2013). Suspected witches are often beaten, burned, raped, hung over fires, cut, pulled behind vehicles, or have body parts amputated. If such torture does not cause death, victims are then often killed in extremely violent and sometimes prolonged manners, including being thrown off cliffs or into rivers or caves, burned or buried alive, beheaded, hanged, asphyxiated, starved, electrocuted, forced to drink poisonous or hot substances, stoned, shot, or dismembered (Amnesty International 2006).

Some PICs have antisorcery or antiwitchcraft laws in place, which provides evidence of widespread belief in witchcraft. In Vanuatu law, sorcery remains a criminal offense; however, most sorcery cases are thrown out in court as too difficult to prove (Forsyth 2015). In 2014, Vanuatu Willie Jimmy, a member of parliament and former finance minister, called for witchcraft to be made punishable by death. Jimmy put forth that such capital punishment for practicing witchcraft was necessary to curb the "innocent" killing of accused witches (Hill 2014, para. 4). In other words, Jimmy espoused that the Vanuatu government was not protecting its citizens from witchcraft through state-sponsored capital punishment of witches, leaving the population no choice but to kill witches themselves.

Progress against sorcery-related violence is being made in some countries. In 2013, the deaths of two PNG women accused of witchcraft resulted in such public outcry that the government responded by repealing the Sorcery Act of 1971, which criminalized acts of forbidden sorcery. They also created a new provision in the Criminal Code Act that stipulates that the intentional killing of a person accused of sorcery will be classified as willful murder. The PNG government also authored the Sorcery National Action Plan, which, if fully implemented, should reduce and hopefully eliminate violence related to sorcery accusations (Gibbs 2015).

In 2015, the Supreme Court of Vanuatu sentenced five men to 15 years' imprisonment each for unlawful assembly

and intentional homicide for the brutal killing of two men accused of witchcraft. The court also sentenced seven men to one year of imprisonment each for organizing the unlawful assembly that led to the murders (Stop Sorcery Violence 2015). Such recent legal and legislative actions evidence potential progress in combating sorcery-related violence.

Micronesia

Overview of Country

Micronesia is one of three main territories (along with Polynesia and Melanesia) that cover much of the Pacific Ocean. Micronesia crosses five time zones and straddles the international date line, mostly north of the equator. The total area of these scattered islands is about 1,000 square miles sprinkled over an expanse of ocean of about 2.9 million square miles (a land area equivalent to the size of Rhode Island spread over a sea the size of Australia). Micronesia includes a series of island groups, including both above-water volcanic mountain summits and low-lying islands or atolls (a ring of coral reefs enclosing a central lagoon).

Political boundaries cross geographical borders. The Commonwealth of the Northern Mariana Islands (CNMI) and the island of Guam are U.S. territories. The Republic of Palau includes part of the Caroline Islands. The Federated States of Micronesia (FSM) includes the remainder of the Carolines and is subdivided into the Yap, Chuuk, Pohnpei, and Kosrae states. The Republic of the Marshall Islands (RMI) includes the two Marshall Island chains; the Republic of Nauru is a single island; and the Republic of Kiribati (pronounced "kiribas") includes the three island groups of Tungaru (formerly the Gilberts), the Line Islands, and the Phoenix Islands.

The original inhabitants of Micronesia settled there about 2000 BCE. As they crossed the expanse of ocean between islands, each group developed a culture unique to their particular situation; however, they had certain characteristics in common. For example, they lived mostly in extended matrilineal groups (land was occupied by the female side of the family, and inheritance was passed down through this line) headed by male chieftains. This gave women a certain level of status. Islanders tended to be respectful to elders, generous with their resources, and reserved about sharing strong feelings in public (Salem Health n.d., 3–4). Their most important values were the "three pillars"—the land, women, and children—as these were the things that ensured survival (Government of the Republic of the Marshall Islands and UNICEF 2003, 10).

Micronesian economies were subsistence-based, meaning they produced food and other products primarily for their own use, including fishing, exploitation of other marine resources, and cultivation of native plants, such as coconut, taro (a tuber), and pandanus (a type of palm). Labor was divided along gender lines, with men and women performing different but equally important tasks. As local economies became larger and trade increased, they developed into regional economic and religious systems. This way of life endured for over 3,000 years, until about 1500 CE.

Around this time, European contact began. From the 16th through the 19th centuries, waves of explorers, traders, and missionaries (both Catholic and Protestant) came from Portugal, Spain, and Germany. They brought knowledge about the wider world and created changes in indigenous religions, economy, family life, and social practices—in short, every aspect of island culture. In the 1900s, the islands also saw war, occupations, and displacements by various military forces and environmental devastation caused by nuclear bomb testing.

Today, Micronesians are overwhelmingly Christian, split between Catholicism and various Protestant denominations, with a small percentage of other faiths, such as Baha'i. Many modern Micronesians have some percentage of European ancestry, and some have Japanese, Filipino, Chinese, or Australian heritage, but most island groups remain primarily of their original ethnicity (for example, over 90 percent of the residents of the RMI are ethnic Marshallese), with small concentrations of foreign workers or expatriates (citizens of other countries living in the islands). English is the official language or one of several official languages in most of the states; however, many local languages, such as Marshallese and Nauruan, are also used, especially in the outlying areas.

Contemporary influences include a continued U.S. presence (the military base and community on Kwajalein Atoll in the Marshall Islands); dependence on U.S. economic assistance; dissemination of Western cultural values (notably, an emphasis on the individual over the family or community); changes in economy (emphasis on wage employment); population growth; changes in land use; diet changes; increases in certain communicable and noncommunicable diseases; effects of climate change; and increases in social challenges such as domestic violence, teen pregnancy, and substance abuse.

The UN Development Programme (UNDP) uses several measures to rank various countries on issues such as gender equality. The Gender Inequality Index (GII), a measure based

on women's reproductive health, empowerment, and labor market participation (UNDP 2014, 157), is not available for the Micronesian nations due to difficulties collecting data. However, the following two related measures may provide some perspective: In 2012, infant mortality data (number of infant deaths per 1,000 births) across Micronesia was as follows: Palau, 15; Nauru, 30; FSM, 31; RMI, 31; and Kiribati, 46 (for comparison, the U.S. infant mortality rate is about 6 per 1,000) (184–187). And in 2014, the Human Development Index (HDI) ranked the Micronesian nations for which data was available as follows: Palau 60th, the FSM 124th, and the Republic of Kiribati 133rd out of 187 nations (for comparison, the United States ranked 5th) (160–163). The above all indicate that women in these countries face significant challenges. Micronesian women and girls have responded to these challenges in different ways in different areas.

Girls and Teens

The experiences of girls and teens across Micronesia differ widely, but a common theme in their lives is the effect of ongoing change. The massive changes in the region have affected every aspect of traditional life. There have been advantages as well as disadvantages, but societal change, whether positive or negative, causes stress. To compound the issue, “in societies undergoing rapid social and economic transformation . . . the pressures facing adolescents are even greater because they have to cope with their own transition to adulthood at the same time their society undergoes immense change” (Government of the Republic of the Marshall Islands and UNICEF 2003, 66). If the

differences between traditional and modern values are great enough, young people can feel like they are “between two worlds” (Government of Palau and UNICEF 2008, v). This stress can lead to greater risk of behavioral and emotional problems, such as family conflict, unsafe and early sex, shame, depression, dropping out of school, substance abuse, and violence.

Conflicts between young women and their families in Micronesia often arise when they feel pulled between the various aspects of their lives, including family obligations, chances to engage with friends or social groups, expectations to participate in church activities, and the pressures of school. Church activities, which may include work projects, sports, cultural activities such as dancing, and fund-raisers (Government of Kiribati and UNICEF 2005, 20), are opportunities for girls and teens to express religious beliefs, to be involved in their communities, and also to “build status” and bring respect to themselves and their families (Lowe 2003, 201). Girls may have an advantage over boys in this regard; because these activities are socially appropriate for girls, they may have extra family and peer support in this area.

Along with many other social changes, sexual attitudes and behaviors are also changing. Sexual information has traditionally been kept very secret, and females were expected to be virgins until marriage. Today, young people are becoming sexually active much earlier (13–14 years of age). Sexual content is available online and in other media, exposing young people to information (or misinformation) at younger ages.

With less reliable information and less life experience, teens are more vulnerable to unplanned pregnancies and

Darlene Keju-Johnson: A Voice for Health

As a young person who left the Marshall Islands in the 1960s to attend school and then college in Hawaii, Darlene Keju was already somewhat nontraditional. She put her talents to work, first as an activist against the ongoing effects caused by U.S. nuclear testing in the Marshall Islands, and later as an advocate for youth in these islands.

In 1983, she addressed the World Council of Churches to raise public awareness about the Marshall Islanders' situation. She described the prevalence of cancers, miscarriages, and birth defects caused by the radiation; the contamination of fish and other foods in the region; and the communicable diseases caused by relocation and overcrowding.

In 1986, Keju-Johnson founded Youth to Youth in Health, which targets out-of-school young people using a peer-educator model to teach about health issues (such as substance abuse and sexual and reproductive issues); to teach counseling skills, and to work to eliminate youth suicide. Youth to Youth in Health operates a health clinic on Majuro (Majro) Atoll and reaches out to the outer islands with their programs.

Keju-Johnson herself was affected by radiation; she died of breast cancer at the age of 45 in 1996. You can view the video of her address to the World Council of Churches here: <https://www.youtube.com/watch?v=1hxCGIA5oJQ>.

—Janet Lockhart

to sexually transmitted diseases (STDs) such as syphilis and HIV/AIDS, both of which are very high in the region. Babies born to teenage girls are more likely to suffer from low birth weight, a high health risk, and may have other challenges, such as their mothers' lack of knowledge about infant nutrition. There are some supports in place to provide information and guidance.

Education

In most of Micronesia, elementary and some secondary education is public, compulsory, and at least nominally free (although families are often responsible for certain costs, such as school uniforms). In Palau and the RMI, church schools also play an important role. Early childhood education (preschool) is somewhat rare, although it is available in Nauru and in the capital cities of the FSM, and the RMI at one time had a Head Start program for five-year-olds (Government of Nauru and UNICEF 2005, 30; Government of the Federated States of Micronesia and UNICEF 2004, 32; Government of the Republic of the Marshall Islands and UNICEF 2003, 54).

The availability of special education services varies widely. Palau offers comprehensive special education for children ages 3–21 (Government of Palau and UNICEF 2008, v), whereas in the Marshall Islands, the Ministry of Education has struggled to build the capacity of schools to accommodate special needs children (Government of the Republic of the Marshall Islands and UNICEF 2003, 57). The attitude toward disability also differs; although each of the Micronesian states has an official policy of quality service to special needs children, there can still be shame, frustration, and stigma around such issues.

Although attendance to primary school seems to be relatively high or improving, a high number of females and males drop out during the teen years. Girls' attendance and completion levels vary across the region: in Palau, with its focus on youth development, 83% of females (and 72% of males) earn a high school diploma (Government of Palau and UNICEF 2008, 41). In Nauru, only about a quarter of female teens attend high school (Government of Nauru and UNICEF 2005, 51), and in the RMI, about half finish high school (Government of the Republic of the Marshall Islands and UNICEF 2003, 50). In most of the region, although secondary school attendance is low overall, girls slightly outnumber boys.

Throughout Micronesia, education faces a number of challenges. Conflicts between families' needs and the

education system lead to females dropping out. Some families may not value education that does not lead to paid work. Teachers are often not highly qualified and may not be held in high regard (Government of the Republic of the Marshall Islands and UNICEF 2003, 53). Infrastructure may be inadequate: school buildings may be old or unsafe, and they lack adequate sanitation or safe drinking water (Government of Kiribati and UNICEF 2005, 39). Transportation and communication problems are common, especially in the outer islands. Also, there may be differences in the young people's home language and the language of instruction at school (often English), introducing an additional barrier (Government of the Federated States of Micronesia and UNICEF 2004, 35; Government of Kiribati and UNICEF 2005, 38). Finally, funding for education may rely heavily on U.S. grants or other aid, which may be subject to cuts. Across the region, many students do not meet the minimum achievement levels necessary to move on to tertiary education (Government of the Federated States of Micronesia and UNICEF 2004, 41).

High school graduates may compete for limited financial resources and access to higher education at regional community colleges, universities such as the University of Guam or the College of the Marshall Islands, or colleges in the United States. Some areas are also introducing vocational or alternative educational programs, such as the Tungaru Nurse Training School in Kiribati (Government of Kiribati and UNICEF 2005, 48), to increase youth participation and prepare them for scarce wage-earning jobs.

Health

Access to Health Care

Women face a variety of challenges regarding health care access. In general, it can be said that health care services are more available in the main cities of each island group and much less so in the outer islands. Throughout Micronesia, resources tend to be needed to treat health issues after a problem has developed and are less available for preventive measures.

Prenatal care, hospital births, and child immunizations are widely available in some places, such as Palau, but much less consistently in the RMI and Kiribati. Relatively few specialists practice in the islands—for example, there is only one women's health care clinic in Nauru—so women may need to see a general practitioner for their obstetric and gynecological needs or wait until a visiting gynecologist comes to their area (Government of Nauru

and UNICEF, 2005, 24). In Kiribati, a shortage of qualified medical personnel has led to a program to increase the knowledge and skill levels of traditional birth attendants (Government of Kiribati and UNICEF, 2005, 63). In most parts of the region, patients must go off-island for specialized treatments or surgeries; there are also few diagnostic laboratories, so samples must be sent overseas for testing (Government of the Republic of the Marshall Islands and UNICEF, 2003, 31).

Maternal Health

In some parts of the region, maternal and infant life expectancy have gone up, but in other places, they have declined. Women may or may not have access to contraception, due both to lack of availability and to religious practices that discourage the use of family planning methods (Government of the Federated States of Micronesia and UNICEF 2004, 7), so women may have frequent pregnancies at short intervals. Obstetric problems such as low birth weight in babies and gestational diabetes in mothers are common.

The practice of breastfeeding, which protects infants against disease, is nearly universal in the RMI, but less so in Palau and Kiribati. In some places, vitamin A capsules are routinely distributed to pregnant women and infants to protect against the effects of vitamin A deficiency, which can lead to blindness and diminish the ability to fight infections such as measles, a serious issue in the region (Government of the Republic of the Marshall Islands and UNICEF, 2003, 37).

Diseases and Disorders

A variety of communicable and noncommunicable diseases are common. In addition, girls and women face a variety of health challenges related to changes in lifestyle, such as the nutrition value of available foods. In general, the islands have seen a decrease in fresh native foods and an increase in imported foods, which are often expensive, packaged or preserved, and high in fat, sugar, and salt. Diseases related to poor nutrition and lack of exercise, such as diabetes, are affecting Micronesian women at younger ages. Cardiovascular diseases, cancers of the cervix and breast, and obstetric complications are leading causes of death in Micronesian women.

In addition, the strategic marketing of commercially produced cigarettes to women in developing countries has contributed to an increase in tobacco use, which varies greatly among women, from less than 6 percent in the

Federated States of Micronesia (Marshall 2005, 377) to the women of the Republic of Kiribati having one of the highest rates of tobacco use in the world (Government of Kiribati and UNICEF 2005, 62). In addition to cancers and lung disease, tobacco smoking is linked to other health-threatening conditions, such as hypertension (high blood pressure).

Mental Health Issues

Females and males are affected differently by certain mental health issues. For example, male teens in Palau develop schizophrenia at about twice the rate of females, 2.8% and 1.2%, respectively (Sullivan et al. 2007, 191), but traditional practices are more supportive of Palauan females (for example, allowing them to continue to live at home and avoid the social stigma of the disease) than males, who may still be expected to find paid work and fulfill reciprocal family obligations (Bower 2007, 8).

Similarly, in some areas, females are less likely to acquire an illness such as alcoholism; for example, strong church pressures in Chuuk State, in the FSM, tend to keep adolescent girls from experimenting as early as boys do, which may protect them from developing dependency. However, all females and males are affected by the serious upswing of alcohol-related male suicides across the region, which traumatize individuals, families, and communities.

Employment

Traditionally, women were responsible for family and household care, and that commonly continues today. Many Micronesian women still work in the home, and now often outside the home as well. Especially in the outlying areas, women continue to produce food through subsistence gardening and fishing or generate cash to buy imported food and pay for education and church-related expenses, among others. Many women work for small amounts of cash by selling items such as handicrafts or vegetables in shops (Government of Kiribati and UNICEF 2005, 66), or they take out microloans to start small businesses. In general, the lack of infrastructure makes such income generation difficult. Also, many women remain unaware of their rights, may not know what to ask for or where to go for help, or face barriers to economic participation due to the traditional dominance of men in these matters.

Since the 1960s, women have had more access to education, especially in urban areas, and this has provided many

with access to better wage-earning professional jobs. This gives them the ability to make more money outside the home, to engage in nontraditional female activities, and to make family decisions (Marshall and Marshall 1990, 45). In many places, such as Nauru, women are beginning to fill middle- and higher-level professional jobs (many as teachers or nurses). However, there are still gender differences in employment opportunities and, thus, differences in pay and other benefits: for example, women are more likely to work as clerks or in service industries, while men are more likely to work in public administration or communications. An interesting exception to the trend is Palau, where women in the salaried workforce typically earn more than men (Government of Palau and UNICEF 2008, 50).

As the prevalence of both nuclear and single-parent families increase, women are increasingly the sole wage earners in a household, and those with salaried jobs may need to keep working beyond a typical "retirement" age (Government of Nauru and UNICEF 2005, 13). Some states, such as Palau, have legislation providing for equal economic opportunity or against workplace harassment, but others have no such protections (Government of the Republic of the Marshall Islands and UNICEF 2003, 74; Government of Kiribati and UNICEF 2005, 67).

Besides salaried professional jobs, Micronesian women also increasingly hold influential positions in local and national governments. In Kiribati, women have held the offices of vice president, secretary to the cabinet, and one of the permanent secretary positions (Government of Kiribati and UNICEF 2005, 68). In Nauru, the post of chief secretary was held by a woman (Government of Nauru and UNICEF 2005, 14). In the RMI, women have served as senators, mayors, and permanent secretaries (Government of the Republic of the Marshall Islands and UNICEF 2003,

74). And in Palau, women have been ambassadors, senators, and Supreme Court justices (Government of Palau and UNICEF 2008, 50). (See the "Politics" section for more information about women in government.) Women continue to be the minority in these and most other high-level positions, however, and continue to network with each other through governmental agencies, nongovernmental organizations (NGOs), and church groups to promote gender equality, gain experience, and give women a greater voice in the decisions that affect their lives.

Family Life

Marriage and Childbearing

Traditionally, young women were strongly expected to marry and bear children to demonstrate their "worth and maturity" (Brewis 1996, 34). Unmarried women were pitied or ridiculed and used for their labor. Arranged marriages were common in some parts of Micronesia, and in other areas, "love matches" were allowed. A good marriage would benefit the couple's families as well as the young couple themselves. The newlywed couple moved in with the extended family of one of the spouses. These practices are becoming less common these days, especially as more young people go overseas for school or work.

Young women are still generally expected to be virgins when they marry and to be monogamous after marriage. They may also be expected not to initiate sex and to respond to their husband's initiations even during times when sex is supposed to be restricted (e.g., during menstruation or late pregnancy) or when they are not in the mood. Married Micronesian women are often expected to obey their husbands, work hard, be humble, and not complain. Nevertheless, love and respect between spouses are ideals to many Micronesian women and men.

Domestic Violence

Women report that domestic violence was not a part of traditional cultures (Dugwen et al. 2013, 320). Nevertheless, as economic and social conditions have changed throughout the region (an example is the high rate of male misuse of alcohol, which is almost universally implicated in domestic violence incidents in Micronesia; Government of the Republic of the Marshall Islands and UNICEF 2003, 13), traditional protections for women and children have been strained. Domestic violence, child abuse, and child neglect are now serious concerns in the region.

All the Micronesian nations have ratified the Convention on the Rights of the Child (CRC), and all except Palau have ratified the Convention to End All Forms of Discrimination against Women (CEDAW). However, Oceania in general (all regions of the Pacific) has an average domestic violence rate of about 35 percent (WHO 2013, 47). (For comparison, the United States falls at about 25 percent, which is “average” worldwide.) Governments, churches, and NGOs struggle to put new protections in place in ways that are “culturally sensitive yet effective” (Dugwen et al. 2013, 321), but they may lack resources, such as counseling or women’s shelters.

Efforts are also limited by islanders’ belief that domestic violence is a private issue rather than a social or criminal issue. Women may be afraid to speak of it, and they may delay or avoid getting help. Understanding of the word *abuse* also varies. Police may categorize reports of domestic violence as *assault and battery* for lack of a more accurate term. The phrase *child abuse* is not widely used because many Micronesians continue to equate *abuse* with *sexual abuse* only, not with *verbal* or *physical abuse*, and this subject is still not often spoken about openly.

The effects of domestic violence—which can be verbal, physical, sexual, or economic—include physical injuries, transmission of sexually transmitted diseases (STDs), depression, posttraumatic stress disorder (PTSD), and loss of ability to work, to function in the family, or to engage in school or social activities. As Dugwen et al. puts it, “Domestic violence is not healthy in any relationship, regardless of culture or traditions” (2013, 321).

Variations on Compulsory Heterosexuality

In Micronesia, as in many parts of the world, there is an unspoken assumption that everyone is heterosexual (known as normative, or compulsory, heterosexuality). This can severely limit the life options of people who are

lesbian, gay, bisexual, or transgender (LGBT), who may marry opposite-sex partners when they would not choose to do so because they are not safe to live their orientation openly. Same-sex activity is illegal in certain Micronesian nations, same-sex marriage is not legal in any of the nations, and the social stigma of being lesbian, gay, or bisexual has been described as “the horror of having a

Nikiranroro: An Ambiguous Status

In parts of Kiribati, a small number of women, called *nikiranroro*, live outside of typical marriage and motherhood. A *nikiranroro* can be a woman who has not married when her age peers have done so, or she can be an “unmarried nonvirgin” who is perceived as being sexually available whether or not she is in fact active. A woman may become a *nikiranroro* in a number of ways: She was divorced, widowed, or separated. She “flaunted community norms” in some way (MacDonald 1998, 14). She had premarital sex. She was raped. Or she was persuaded by her family to leave a violent husband.

The connotation of *nikiranroro* depends on the situation and who uses it. Married women may use it disdainfully to describe an unmarried woman and segregate her from her “categorically chaste” peers (Brewis 1992, 202) if they perceive her status to be her “fault” in some way. Married men may have community approval to seek sexual satisfaction from a *nikiranroro*, as long as they do not fall in love with her (which is reserved for wives). Some *nikiranroro* choose the status for themselves to find greater social and sexual freedom. As one woman put it, “Because I am a *nikiranroro* I can go where I want and do what I want. That is better than being a wife” (Brewis 1996, 32).

secret . . . that you are afraid to tell anyone for fear that they will not love or respect you anymore” (Nicloy 2006, 18).

In some places in the Pacific, variations on compulsory heterosexuality may be accepted. In Kiribati (as well as in many Polynesian societies), some people fall into a “third gender” category (what Westerners would call *transgender*): sometimes, men live outwardly as women, wearing women’s clothing, taking women’s names, and doing women’s work of child care and housekeeping; some women live, dress, and behave as men. Such people may be ridiculed or teased, but they are at least nominally tolerated (Brewis 1996, 34). Also, in Kiribati, there is a class of women known as *nikiranroro* (“remnant of their generation”), unmarried nonvirgins who are seen as dishonored or sexually “loose.” Some women choose this status for their own reasons.

Politics

Micronesian women have always engaged informally with “politics,” which takes place in every aspect of their lives. Within their extended families, women have wielded influence as lineage heads, household managers, and landholders. In these roles, they cooperate with chiefs, organize household and food procurement work, and oversee child care.

At a community level, women may use existing structures, such as women’s church groups, to influence political issues affecting themselves and their children. In some areas of the FSM, women use these established gender- and age-related discussion groups to explore the appropriateness of certain behaviors for women, men, and adolescents (such as domestic violence, substance use, and local conflict or gang activity). In situations where their voices may not typically be heard, they can express their concerns and be supported (Flinn 2013, 22).

To succeed in politics, whether formal or informal, certain characteristics are needed. Good problem-solving skills, a level of education, and a polite but firm public speaking persona are essential. In general, and especially in areas where “kin politics” are strong (that is, where family relationships decide who runs for office and earns votes and where single women may be at a disadvantage), it is important for women to embody traditional gender-associated traits, such as gentleness, the willingness to put the needs of others over their own, and an acceptable public demeanor (Marshall and Marshall 1990, 56). Women’s experiences of informal politics within the traditional and religious arenas help them cultivate these valuable skills for working within the formal political arena.

In formal politics, whether at a local, national, or international level, Micronesian women advocate around issues such as climate change; human rights issues (including LGBT rights, labor violations, and sex trafficking); and building peace in the Pacific. Women exert political influence through their increasing presence in law- and policy-shaping positions (such as senators and permanent secretaries) in many local and national Micronesian governments. They engage in activism that is both top-down, in which aid or intervention is solicited from outside the region, and bottom up, in which local groups band together to address regional and international concerns (George 2011, 59). Their activism takes a variety of forms, from marches and rallies, to letter-writing campaigns, attendance at international conferences, political lobbying, and even theater presentations (George 2011, 44–45).

At the Micronesian Chief Executives Summit in December 2013, Guam’s governor, Eddie B. Calvo, compared the region’s efforts for self-determination to Nelson Mandela’s fight against apartheid (a system of racial discrimination and segregation) in South Africa. He reminded the audience that Micronesian nations are some of the “youngest democracies in the world . . . fighting for the same cause of individual liberty” as Mandela (Eugenio 2014). Micronesian women are instrumental in that struggle.

Religious Roles

Religion, specifically Christianity, is pervasive in Micronesia. Churches wield great influence on public attitudes, provide many services—schools, sports and training programs, community groups—and shape women’s lives. Women in various parts of Micronesia have integrated its influence in various ways.

In most of Micronesia, church attendance is very high, and in some places, membership in age- and gender-related church groups is mandatory. Churches are important centers for exploring faith, receiving guidance, and promoting social and community development. As such, they can be a source for both stability and social change (Government of Kiribati and UNICEF 2005, 21).

Churches can also either limit or promote women’s and girls’ ability to deal with issues of concern to them. For example, in the case of domestic violence, tradition might dictate that a woman may leave or divorce her husband for her own well-being and that her extended family would protect her and perhaps help her find a better husband later. In contrast, the Catholic Church may press for the nuclear family to remain intact, limiting the woman’s

ability to avoid the abusive relationship and remain safe (Flinn 2013, 24).

On the other hand, women are not just passive respondents to hierarchical church dictates. Some Catholic women have incorporated the food-based imagery of the Feast of the Immaculate Conception with the bountiful imagery of similar indigenous feasts so that women's roles as procurers of food are emphasized and respected (Ames 2013, 190). Women in Pollap use church discussion groups to reinforce connections between Christian and traditional values. Christian concepts such as showing compassion and refraining from violence help them draw what they see as essential lines of continuity between their indigenous past and their modern religious convictions. As Flinn puts it, "it is as though they use Catholicism as a way to be perceived as being better Pollapese" (20).

Church influence extends to the realms of women's physical and mental as well as spiritual health. In some parts of the FSM, church doctrine that "good Christian women are not supposed to smoke or drink" is widely adhered to, and this belief may be to girls' and women's health benefit, as it means they are much less likely than males to use or abuse these substances (Marshall 2005, 374).

Women's experiences of the huge social issues of sexuality and STDs such as HIV/AIDS are also affected by church attitudes and dictates. Because of the traditional reluctance to speak of sexual matters and the stigma around the sexual nature of these infections, there is opportunity for shame and silence as well as acceptance and information. In terms of STDs, some churches may focus on promoting prevention, such as use of condoms (Government of Nauru and UNICEF 2005, 26), while others may condemn the sexual behaviors that are, or that are assumed to be, the cause of the disease (for example, many church counselors may still blame same-sex activity for the rapid spread of HIV/AIDS, when currently heterosexual activity is often the source of the spread). In terms of sexual orientation and sexual behavior, many may encourage empathy for the societal oppression of LGBTQ people and at the same time advocate promotion of "traditional concepts regarding marriage and family" (Nicloy 2006, 18)—which usually include only heterosexual monogamy—without acknowledging that this constitutes compulsory heterosexuality. The sexual and mental health of teens, women, and men are affected by these influences.

Issues

The issues described here cannot be unraveled from their effects in the lives of girls and women as described in

the previous sections. These are chosen because of their uniqueness, severity, or relevance to girls and women in other parts of the world.

Environmental and Health Damage in the Marshall Islands

During the 1940s and 1950s, many Marshall Islanders were forcibly dislocated from their home islands to make way for U.S. military activity. The immediate consequences were social and psychological trauma resulting from the dislocations, physical hardships from being relocated to islands without adequate food or water, and the environmental and health effects of radioactive fallout from the nuclear bombs tested on Bikini and other Marshall Islands. As is common in many parts of the world, women and girls were also affected by acts of physical and sexual violence committed against them by personnel of the various military forces in the region (George 2011, 61).

Long-term effects of the bombing include radiation poisoning in the land and sea, making many foods no longer edible, and some islands being uninhabitable for thousands of years. Direct health effects of the radiation include high numbers of miscarriages and birth defects, including what Darlene Keju-Johnson described as "jelly-fish babies" (Johnson 2013), and various cancers, thyroid problems, and immune deficiency disorders. Long-term effects include noncommunicable disease, such as diabetes, related to food supply issues, and the rampant spread of communicable diseases such as tuberculosis (TB), which occurs on Ebeye, for example, at 23 times the rate in the United States (California Newsreel 2008); cholera; respiratory infections; and waterborne illnesses. All of these conditions are due to overcrowding on small islands that still may not have electricity or running water. The effects of waiting for promised compensation payments for nuclear-affected victims, and of heavy dependence on U.S. aid, also take a psychological toll.

Climate Change

In 2014, the Republic of Kiribati bought land in Fiji, anticipating the need for their residents to migrate when increasing sea levels inundate their own islands about 30 years from now (Dizard 2014). Because many Pacific islands lie only a few feet above sea level, Kiribati is not the only nation looking ahead in this fashion. Other nations, such as Tuvalu and the Maldives, are also considering the possibility of buying some higher ground (Dizard 2014). Climate change is bringing both drought and floods, the

inundation of freshwater wells and taro patches with seawater, and ocean water acidification that is killing off the life-sustaining coral reefs. Changes in their ability to access freshwater and procure food and shelter for their children will disproportionately affect women, who are more likely to live in poverty and lack access to needed resources that will help them move to safer ground.

Labor Violations

Saipan, the capital of the CNMI, was the center of a decades-long controversy about the use of foreign workers in inhumane conditions in garment factories. Part of the CNMI's commonwealth agreement with the United States exempted the territory from the Immigration and Nationality Act and from minimum wage requirements. Foreign-owned garment companies brought in guest workers from poor Asian countries to cheaply produce clothing that could be imported to the U.S. mainland labeled "Made in the U.S.A." The workers—mostly women, many of whom were working for money to support children in their home countries—had few protections. The conditions of their "recruitment" meant they often had to work for years to pay off debt to their recruiters, and other abuses—such as rapes, forced abortions, and summary deportation of pregnant workers—occurred as well (Clarren 2006).

After years of lobbying in the U.S. Congress, a protracted influence-peddling scandal, an investigation by then representative George Miller (Vorderbrueggen 2008), and two class-action lawsuits, some improvements were made. Lawsuit monies were allocated, and some were disbursed. An ombudsman's office was created in Saipan. In 2007, Congress declared the islands subject to minimum wage standards.

However, as of 2012, there were still pressures in Congress to curtail the minimum wage (Moyers 2012). Factory inspections are rare, the ombudsman's office has no authority to prosecute violations (Vorderbrueggen 2008), and many factories have closed and moved to regions with even fewer worker protections.

Concern remains that garment workers still will not be able to pay off their "recruiting" debts, afford to return to their home countries, or find other paid work in Saipan. They may be forced to move into scarce jobs in the legitimate tourist industry or into sex tourism (e.g., prostitution, strip clubs, and massage parlors). A continued lack of government intervention makes the islands a "breeding ground for slavery" (Clarren 2006).

Sex Trafficking

In Micronesia, trafficking in human beings is common. The RMI, Guam, the CNMI, and the FSM have all been implicated as both source and destination countries for women and girls subjected to sex trafficking. Palau, the FSM, and the RMI were all on the Tier 2 Watch List for 2013 (U.S. Department of State 2013), indicating they are among countries where the "absolute number of victims of severe forms of trafficking is very significant or is significantly increasing" (Eugenio 2014). In places where women or girls are vulnerable due to poverty, poor education, or a lack of family support or other resources, they are more likely to become victims of trafficking.

Some protections are in place. The FSM, Kiribati, and Nauru have ratified or acceded to the 2003 United Nations Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children (United Nations 2003, 319), and two states of the FSM have laws against sexual servitude of children and involuntary servitude of adults (but not sexual servitude of adults) (U.S. Department of State 2013). However, all Tier 2 nations continue to face challenges with raising public awareness, developing effective action plans, and prosecuting identified cases of trafficking.

Mongolia

Overview of Country

Mongolia, the 19th-largest country and the 2nd-largest landlocked country in the world, is located in North Asia and borders China and Russia. It is approximately 603,905 square miles (1,564,116 sq. km). As of 2015, Mongolia had a population of 3 million. Approximately, 72 percent of the population lives in urban areas, and 1.37 million live in Ulaanbaatar (or Ulan Batar), the capital city (CIA 2016).

The officially reported literacy rate is above 97 percent, and the poverty rate is 21.6 percent. The country’s gross domestic product (GDP) growth is 7.8 percent. In 2014, the UN Development Programme (UNDP) ranked Mongolia 103rd out of 187 nations based on the Gender Inequality Index (GII; 0.320). The World Economic Forum (WEF) ranked Mongolia 58th out of 144 countries based on the Gender Gap Index (0.705) in 2016 (WEF 2016).

The overall sex ratio at birth is 1.05 male(s)/female, and a 2014 estimate of the sex ratio of the total population is 1 male(s)/female. Close to 44.5 percent of the population is under 24 years old, and 50.48 percent of the population is

female. On average, women have a longer life expectancy (73.76 years old) when compared to men (65 years old) (CIA 2016).

There are eight major ethnic groups in Mongolia, among which the largest group is the Khalkh (81.9%). The Kazakh is the second-largest (3.8%) group, living primarily in western Mongolia. After Kazakhstan gained sovereignty from the Soviet Union (1990), many Kazakhs in Mongolia migrated to Kazakhstan, which inevitably impacted the Kazakh population in Mongolia. Other ethnic groups in the country include Dörvöd, Bayad, Buriat, Dariganga, and Urianhai (CIA 2016).

Spoken by more than 85 percent of the population, Khalkha Mongolian is the official language in Mongolia. Other languages spoken or used in the country include Russian, English, Chinese, Japanese, and Korean (CIA 2016).

All religions were banned from 1921 to 1990, but they revived in postsocialist Mongolia (1990–present). Buddhism, Islam, Christianity, and Shamanism are four major religions in the country, among which Buddhism and Shamanism are traditional religions. More than half of the population is reportedly Buddhist. Islam is primarily practiced among Kazakhs. There has been an increase in the Christian population since 1990. The majority of registered religious organizations are primarily Buddhist and Christian.

Mongolia won independence from China with the help of the former Soviet Union in 1921. It became the second socialist country in the world—the Mongolian People's Republic (1924–1992)—and a Soviet satellite. After the dissolution of the Soviet Union in 1989, Mongolia became the first postsocialist country that held democratic elections in 1990 and started its transition into a democratic country with a market economy. It enacted the new constitution in 1992 and amended it in 1999 and 2001. Under the new constitution, over 20 political parties have competed for presidential elections every four years and competed for the 76 Parliament seats. The Mongolian People's Party (MPP) is the largest political party, followed by the Democratic Party (DP).

Mongolia is divided into 21 *aimags* (provinces) and the capital city, Ulaanbaatar. Ulaanbaatar has 9 districts and 132 subdistricts. The 21 *aimags* are divided into 338 *soums* (second-level administrative subdivisions) that have 1,682 *baghs* (the smallest administrative units).

Since 1990, Mongolia has undergone drastic political, economic, and social changes that have created opportunities and problems for women in the postsocialist era.

Aiming to establish a legal basis to ensure gender equality in all spheres, the Law on Promotion of Gender Equality was passed in 2011. The United Nations launched Sustainable Development Goals (SDG) in Mongolia in 2015. One of its goals is gender equality and empowerment of all women and girls.

Girls and Teens

As of 2016, 44.5 percent of the total Mongolian population is under the age of 25 years old, and the sex ratio is 1.03 male(s)/female for the 15–24 age group. The youth dependency ratio is 41.7 percent (CIA 2016), but many young people live in poverty because of an increased number of female-headed households that are stricken by abject poverty. This is particularly rampant in rural areas that depend so heavily on the herding industry and mining areas that have very limited job opportunities for women and girls.

There is a huge disparity in girls' extracurricular activities and educational opportunities in Mongolia. The low population density in Mongolia affects girls and teens differently, depending on regionally specific economic activities and available resources or educational opportunities. Economic activities in Mongolia depend heavily on herding, agriculture, and mining, which are traditionally and professionally male-dominated. As a result, more male youths join the labor force without earning high school diplomas or college degrees. Girls, on the other hand, participate in less physically demanding economic activities closer to home, and they are more likely to have more years of schooling, including college. Realizing that girls have limited job opportunities because of gender difference and occupational segregation, many parents try to support their daughters through high school or college so that they are more employable.

Girls in rural or nomadic communities usually have limited access to an array of extracurricular activities because of the scarcity of facilities in schools. Some also have family responsibilities after school and have to help take care of family herds or do house chores. Those from nomadic herder families living in remote areas usually attend boarding schools and visit their families during school breaks from June to August every year. While in school, these girls participate in organized school activities, including sports and education-related events. As for girls living in large cities, they have more extracurricular activities, such as Girl Scouts, sports, art, and foreign-language

learning. They are also able to attend private schools if their parents can afford it. By contrast, girls living in poverty in big cities are more vulnerable to homelessness, drugs, and human trafficking.

Education

Mongolia has undergone a series of structural changes and reforms in its education system since 1990. For example, the original 10-year school system was changed to an 11-year school system in 2004 and then to a 12-year school system beginning in 2008, which is to be completed by 2016. School-age children now start primary education at the age of 6 instead of 7. Irrespective of all the changes, the state emphasis on universal and compulsory primary and lower secondary education, which was accomplished in the early 1960s, has remained unchanged. Although socioeconomic status, such as unstable living conditions in remote rural areas, affects school-age children's enrollment, Mongolia has almost achieved near universal primary education for both girls and boys of 15–24 years of age. The overall youth literacy rate is 98.51 percent, with a female literacy rate slightly higher (98.98%) than the male literacy rate (98.05%) (UNESCO 2015a).

The enrollment rate in education for girls and boys is high in Mongolia. Attendance in early childhood education includes approximately 55.9 percent of males and 59.8 percent of females. The net enrollment ratio in primary school participation is 98.5 percent for females and 99.4 percent for males, and the secondary education participation is 78.9 percent for females and 74.1 percent for males. Nevertheless, only 24.5 percent of the poorest 20 percent attend school, as opposed to 80.3 percent of the richest 20 percent. The enrollment ratio in primary school is approximately 99.4 percent for boys and 98.2 percent for girls (UNICEF 2013). The country's school life expectancy for females is approximately 16 years, as opposed to 14 years for males.

Mongolians are required to receive nine years of free basic education, including six years of primary education and three years of lower secondary education. The Mongolian government prioritizes education, which makes Mongolia one of the top countries with a high literacy rate in the world. When compared to global male and female youth literacy rates at 92.6 percent and 88.6 percent (UNESCO 2016), male and female youth literacy rates in Mongolia (15–24 years old) are at 98 percent and 98.9 percent, respectively (UNDATA 2016).

Enrollment in higher education in Mongolia reflects reverse gender disparity. The level of female enrollment in college is higher than the average in developed countries. Some male youths drop out of school in postsocialist Mongolia, primarily because they depend on family support for advanced education, and some parents, especially herders, are unable to pay the costs associated with their education. In the meantime, some male youths choose to attend technical or vocational schools because of the increasing demand for workers in the mining industry, for example, or other male-dominated occupations. For female youths, occupational segregation and a bleak job market in general pose more challenges. Many of them choose to continue with their education for future economic security and employment opportunities.

Even though there are more female students in college, most female science majors are in biology or medicine; they are still outnumbered by male students in STEM fields, including physics, mathematics, computer science, technology and engineering. For example, 73 percent of biology majors are female, whereas only 30 percent of computer science majors and 24 percent of engineering majors are female (UNESCO 2015).

The Mongolian government implemented an explicit policy to support sexuality education for every Mongolian school child. It launched sexual education reform in 1998 and identified 10 priorities for health education, including reproductive health. Sex education courses are available from the 3rd grade through the 10th grade. Each grade focuses on specific topics. For example, 3rd graders study gender roles, anatomy, and physiology. Students in the 10th grade learn about marriage, rearing children, prenatal care and childbirth, STIs, and HIV/AIDS (Population Council 2002).

Employment

The economy in Mongolia relies heavily on agriculture; livestock (herding of horses, cattle, camels, sheep, and goats); and mining (UNESCO 2013). Presently, 40 percent of employed people are in the agriculture and herding industries. The mining industry has expanded rapidly since 1990.

Mongolian women have played an active role in family economic life and economic decisions. After the economy was transformed from a nomadic pastoral economy to a centrally planned urbanized industrial economy in the socialist era (1921–1990), state policies protected women's

participation in all sectors, which enabled women to be actively engaged in a wide range of economic activities in material or nonmaterial production. Most of them were hired in trade, medicine, or education. The employment rate was relatively high. For example, in 1985, 51.3 percent of the employee workforce was composed of women. Mongolian women were successful in all the core indicators (Burn and Oidov 2001).

In the postsocialist era, however, changes in the country's once planned economy adversely affected women. Women experienced a higher rate of unemployment. Many did not have the skills required in the new system and were unable to find jobs once the government gave private enterprises and employers more hiring autonomy. Additionally, unemployment policies changed dramatically in the new economic system. As a result, more women worked in underpaid occupations (e.g., trade, service sectors, and education), and more women, particularly those who head their households and work in agriculture or are self-employed, were likely to live in poverty.

In 1990, women accounted for 45.6 percent of the total labor force (ages 15 and older). There has been a noticeable increase to 45.8 percent or 48 percent, according to different sources (UNESCO 2013). The level of women's participation in the labor force is still lower, considering the sex ratio (50.6% of the population is female) and concentration of working-age groups—there are more women 15–64 years old. Irrespective of the Law on the Promotion of Gender Equality (2011) that clearly prohibits gender discrimination, gender inequalities have become more pronounced. In particular, the workplace is a sector for increasing gender disparities in job opportunities, promotion, fair wages, and benefits. The unchanging fact is that more women continue to work in low-paying sectors, and fewer women are in higher-level managerial positions, which undoubtedly affects labor market outcomes for women (Khan et al. 2013). In 2015, the WEF ranked Mongolia 60th out of 145 countries based on labor force participation.

Girls and women in Mongolia have a higher literacy rate than boys and men, and more women hold college degrees. Women also account for close to half of the Mongolian workforce. This means women are supposedly more hireable, or at least have more opportunities in the workplace. In actuality, Mongolian women, especially educated women, have a higher rate of joining the labor force, and their economic participation rate is higher when compared with other developing countries. Nevertheless, market reforms

and cutbacks on social welfare and child care have forced many women to enter low-paying jobs (BDHRL 2015). Women tend to work in informal or service-oriented sectors, whereas more men work in higher-paying heavy-duty occupations, such as mining, transportation, and energy. On the one hand, gender norms affect the hiring process; employers are less likely to hire women over men for positions in male-dominated occupations. Women are also discouraged from going to vocational schools or entering these occupations. On the other hand, women are prohibited by law from working in certain occupations, especially those requiring heavy labor or exposure to chemicals that are believed to harm women's maternal health. Gender norms and laws combined inevitably limit women's job opportunities.

Women in professional fields in urban areas are more concentrated in health care and legal services. Although more recent data are insufficient, approximately three out of four doctors and three out of five lawyers were females as of 2007 (Morris 2007), which can exemplify women's participation in professional development in Mongolia. Women without formal employment choose to set up informal businesses in the service sector. They are vulnerable to risks in the market economy, which clearly affects their earnings and stability.

More women in rural areas participate in economic activities than their peers in urban areas. The economic transition in postsocialist Mongolia has revitalized the herding lifestyle in rural areas. Animals that were appropriated by the state have been redistributed to the owners, who are usually men. Nevertheless, the rapid growth in the mining and transportation industries has enabled many men in rural areas to enter these industries for better pay. As a result, married women must assume more responsibilities and play a more important role in helping raise family animals and do chores outside the house, but they usually receive minimum or no pay. This leaves them more dependent on their husbands. Some women also work as unpaid herders in small family economic activities. There are also women who are household heads and the primary source of family income. With limited access to job opportunities or better-paying jobs, they are more likely to live in poverty, even if they actively participate in economic activities.

Women are also seen in the artisanal mining activities. Among the 37,000 people working in the mining industry in Mongolia as of 2014, over 25 percent are women. They usually work fewer hours and earn less than men because

of their roles in the household. A survey also shows that close to 17 percent of “all top managers of Mongolia’s mining companies are women,” which is above the global average of 12 percent (WIMM 2016). When it comes to promotion or leadership positions in the workplace, however, fewer women are in higher-level managerial positions (Khan et al. 2013), and the top positions in most fields and occupations are held by men. Many women hold midlevel positions in, for example, trading and manufacturing management (BDHRL 2015), whereas more men are likely to be promoted or given opportunities for professional development, even in female-dominated sectors.

Even though Mongolia is ranked 22nd out of 145 countries based on wage equality for similar work, women are still underrepresented in sectors with higher pay, and they still make less than men at almost all levels (WEF 2016). They reportedly make 87.6 percent of men’s average salaries. Women in managerial positions across all sectors receive 77.2 percent of what men in similar positions earn. Women’s pensions are also lower (BDHRL 2015). Even though men and women doing the same job in some job positions are paid equally, women usually hold low-paying positions where there are more women than men.

Various factors affect a woman’s earnings at different stages of her career. Early-career Mongolian women usually have more years of education or hold higher degrees than their male counterparts, but their median wage is 25 percent lower than that of men, which is 11.7 percent lower than what they should make, even if only educational attainment is considered. Some argue that these young women are more likely to take maternity leave and are less motivated at work, which could be an explaining factor of lower earnings (Pastore 2010). However, other contributing factors of the wage difference include types of education attainment; geographical locations; formal or informal sectors (i.e., with or without contracts); types of occupations; work experience; double burden at work and at home; care obligations; and years of service, to name a few. The most recent report from the National Statistics Office indicated that the average monthly salary for women was roughly 88 percent of that of men (BDHRL 2015).

Women employees enjoy paid maternity leave during pregnancy and after childbirth. The International Labor Organization (ILO) proposes a minimum of 12 weeks, but it recommends a 14-week maternity leave to its member countries in its Maternity Protection Convention (also Convention No. 183). Although Mongolia is among the majority of the member countries that have not ratified

the convention (it did ratify ILO No. 103, which is one of three maternity protection ILO conventions), it gives new mothers 17 weeks of paid leave with 70 percent of their salary. Specifically, women receive 45 days of pregnancy leave and 56 days of birth leave. Women are also allowed to combine maternity leave with their allocated annual leave. If they request a longer leave, they can take an additional six months of unpaid leave and return to work afterward. When they return to work, their employers are required by law to allow longer breaks for child care or feeding younger children. In addition, mothers with younger children are not to be assigned to work night shifts.

Family Life

The legal minimum age for marriage is 18 in Mongolia. The mean age at marriage is 24 for women and 26 for men. The government usually pays 100 percent maternity leave for 120 calendar days. Means and modes of livelihood and economic development have historically shaped the family structure and size in Mongolia. Nuclear and one-breadwinner families are more common in Mongolia, a country that depends heavily on livestock and where 25–40 percent of the population lives as nomadic herders. A traditional family is a married couple and their children. In 2013, the average family size was 3.5 persons. The crude birth rate was 20.88 per 1,000 persons in 2014, and the total fertility rate was approximately 2.13 children per woman in 2016 as compared to 1.87 in the United States (CIA 2016).

A woman usually marries out of her family and starts her new family with her husband instead of living with her in-laws. Traditional Mongolian weddings are usually arranged between two families, which involves transfers of the bride’s wealth from the groom’s family and a dowry from the bride’s family. Marriages are usually among people from similar backgrounds, such as education and occupation. Divorce in the 1980s was relatively rare. The crude divorce rate (CDR) was only 0.3 divorces per 1,000 inhabitants in 1980 and 1985. However, divorce has been on the rise in the postsocialist Mongolia, especially in urban areas in recent years. In 2015, the CDR was 1.8. It is much higher than 30 years ago, but it is still low when compared with other countries, such as the United States (a CDR at 3.6 in 2015). The higher divorce rate is primarily caused by financial challenges because of male unemployment, alcoholism in lower- and middle-class families, domestic violence, or disparities between the educational levels of spouses.

Demographic differences; mobility (e.g., internal and external migration); access to opportunities and resources; and participation in economic activities have impacted women and their family lives differently. Whatever activities in which women partake, the gender division of labor in family life usually aligns with traditional gender roles, and women usually engage in unpaid family labor. For example, women in nomadic families assume very specific gender roles and usually assume responsibilities in the domestic sphere. Whereas men herd, hunt, and kill animals or fix technical problems or manage animal shelters outside the *ger* (traditional portable Mongolian dwelling), women presumably do housework or seasonal family labor, such as collecting water, cooking, cleaning, sewing, milking animals, making dairy products, sewing, spinning wool, and taking care of children. Employed working women, on the other hand, carry a double burden at work and at home. Many of them spend over 20 hours a week doing house chores after work. Many women are also the primary financial supporters in their households if their spouses are unemployed.

Women and children in female-headed households encounter more challenges and financial strains. Many women have divorced their husbands because of male unemployment and related problems, such as alcoholism and domestic violence. Some women get pregnant out of wedlock and become single mothers. There is no penalty if a divorced husband fails to pay child support, leaving more financial strain on women. In addition, a lack of family members to help with livestock or heavy-duty work and shortage of livestock, for instance, adversely affects female-headed households. A higher level of widowhood at ages 60–64, unpredictable climate change and natural disasters, and limited sources of income also pose challenges for female-headed households. As a result, these households are vulnerable and prone to poverty, especially in rural areas and highland regions.

A married woman usually has limited access to family finances, although women are by law entitled to inheritance, land use, and property ownership. The Mongolian tradition favors men; they are given the family herds or the *ger*. Once a woman is married, she depends on her husband for livelihood. As more women work informally, they may simply let their husbands make financial decisions. Family businesses are often registered under the husband's name, and ownership is transferred automatically to the husband once a couple gets divorced. Women seeking a divorce are more likely to encounter legal and financial

barriers. It usually takes a few months to get a divorce, which sometimes comes with restrictions. For example, women who are pregnant or have children under one year old are not legally allowed to file a divorce. A divorce is also expensive. Some women have to wait for years before they have enough money saved to pay divorce fees. Divorced couples usually evenly divide property and assets acquired during their marriage. More women than men retain child custody once granted a divorce.

Health

Mongolia has been ranked first out of the 145 countries in women's health since 2006 (WEF 2016). Health Law (1998) states that all citizens are entitled to free primary health care, maternal care, and child care and are required by law to register for health services and receive annual physical exams. The government pays for services (e.g., preventive care, disease surveillance, and epidemiological monitoring) provided by primary providers. Administrative divisions determine how health service is delivered at three different levels: primary, secondary, and tertiary. For instance, maternal health and child health are among the prioritized free public health services in approximately 530 facilities at the primary level in Mongolia. Services are also provided with copayments in 36 district, regional, or central hospitals at secondary and tertiary levels. Private clinics and hospitals require out-of-pocket payments. Doctors are highly concentrated in larger cities, such as the capital city, which poses challenges to health care for women in rural areas. Health services have continued to deteriorate since the transition to the market economy and privatization of the health care sector started in the 1990s.

Mongolian women's average age at first birth is 21.9, and their median age at first birth is 25–29. The fertility rate is 2.17 children per woman as of 2015, which leaves the country ranked 100th out of 224 countries in the world. The infant mortality rate is 23.15 deaths per 1,000 live births, and male infants have a higher mortality rate (26.4) compared to female infants (19.75). The average maternal mortality ratio (MMR) worldwide was 216 in 2015, whereas it was 44 in Mongolia. This number is lower than the initial Millennium Development Goal of 50 by 2015. It is also much lower than it was in 1990 (186 per 100,000 live births), when many women were unemployed and the health care system was ineffective. Mongolia has undoubtedly made progress in improving women's health in the postsocialist era. Nevertheless, some *aimags* have a

higher MMR due to a shortage of health care providers; a lack of knowledge or skills; or a shortage of drugs, supplies, or blood products (CIA 2016).

By law, Mongolian women are entitled to state-sponsored primary health care (PHC) and preventive services. For instance, pregnant women and infant babies have free medical care at all three levels of health care facilities. Nevertheless, women's access to health care services differs depending on demographics and physical locations, and they may experience higher health risks accordingly. The affordability of health care also varies depending on women's income.

Women living in rural and highland areas, in particular, have to travel long distances to visit doctors because medical facilities are not readily available or do not have basic, functioning diagnostic equipment. As a result, many women may delay their visit or refrain from traveling long distances because the financial strain is high. Some women experiencing complications undoubtedly have higher risks from not receiving timely treatment. For instance, maternal health specialists are usually available in the capital city, which means a two-day trip for many women. With the help of the UN Population Fund (UNFPA), telemedicine is now available in remote Mongolia to connect pregnant women to faraway care (UNFPA 2015).

In the area of reproductive health, more than 50 percent of married women and 35 percent of all women of reproductive age use modern methods of birth control, and more women in rural areas use contraceptives. Methods by popularity are intrauterine devices (IUDs), condoms, birth control pills, injections, female sterilization, and implants. However, fewer married women under age 19 use contraceptives. There has been a decline in contraceptive prevalence.

Women with no or low income and primary or less education have a much higher fertility rate. The teen pregnancy rate has risen in rural areas since the 1990s. The teen birth rate—the number of live births per 1,000 people—was close to 41 in 2013. The lack of reproductive knowledge is reported to be a primary contributing factor. Cohabitation is popular among people of reproductive age in Mongolia. It is common for a couple to cohabit two to three years and even have children before getting married. This may also explain why there is a higher teen pregnancy rate. Other factors include access to birth control, level of education, socioeconomic status, and family background. Teen girls in rural areas have a higher pregnancy rate than their peers in urban areas. Teen pregnancy can

harm girls' health, cause premature birth and low birth weight, and limit girls' opportunities for personal development and well-being. The Mongolian government has actively empowered women and girls with systemic family planning services, including sex and reproductive health education, contraceptives, antenatal care assistance and coverage, full coverage of health care for mothers and children, and medicine and supply subsidies. Specific adolescent reproductive and sexual health education programs have also been established.

HIV prevalence is very low in Mongolia (less than 0.01% in the general population and 0.03% in the reproductive-age population), according to UNAIDS (2015). The cumulative number of reported HIV cases since the first case was reported (1992) is 181 as of 2014 (UNAIDS 2015). The high-risk population is men who have sex with men (MSM), and that group has more reported HIV cases than female sex workers (FSWs). Nonetheless, women engaged in sex work because of unstable financial situations and limited alternate sources of income may experience increased risks for HIV and sexually transmitted infections (STIs) by having unprotected sex. Among the reported HIV cases in women, approximately half occur among sex workers aged 25–44 who live in the capital city.

Cancer screening for women in Mongolia is not as common as it is in many other countries. The breast cancer rate in Mongolia has increased in urban areas in the past decade, but only 25.1 percent were diagnosed in the earlier stages (Angarmurun 2014). Age, menopause, and breast cancer correlate in Mongolia. Mongolia also has one of the highest cervical cancer rates in East Asia. Women are usually not aware of these cancers, know very little about them, and fail to seek diagnosis or treatment.

Politics

In the 2015 *Global Gender Gap Report*, Mongolia is ranked 117th out of 145 countries in women's political empowerment, 102nd in women's representation in the Parliament, and 105th in women in ministerial positions (WEF 2016). Before Mongolia became a Soviet satellite state (1921–1990), Mongolian women were excluded from political participation and influenced by the political system, gender norms, and the nomadic ways of living. In 1924, they were granted the right to vote and be elected in the one-party political system. The Mongolian Women's Federation was also founded to coordinate and facilitate women's political participation.

Mongolian women's rights to free political participation were further protected by legislature in 1926. A quota system was adopted to ensure 25 percent of women's representation in Parliament. At one point, 30 percent of local government positions were taken by women (1931). By the end of the 1980s, 20–24 percent of the Parliament seats were taken by women. Historically, the government also appointed women ministers of state or department heads. For example, the first female acting head of state was appointed in 1953. However, women were still underrepresented in political activities and decision-making processes.

Postsocialist Mongolia has adopted the presidential-parliamentary system of multiparty democracy. It held its first free multiparty elections in 1990, a milestone for Mongolian democracy. The 1992 constitution reiterated that women have equal rights to political activities, but the quota system for women's representation in the government was abandoned. This has inevitably impacted women's share in the Parliament seats. In reality, women have been underrepresented on all political and decision-making levels, even though more women than men hold college degrees in Mongolia. While women accounted for approximately one-quarter of the Parliament in socialist Mongolia, women's representation in the Parliament dropped to 3.9 percent in 1992. It was 10.5 percent in 1996 and 14.9 percent in 2015, which is lower than the world average of 21 percent and the desired 20 percent (WEF 2016).

Very few Mongolian women have taken the top leadership positions since 1990. In 1999, Tuya Nyam-Osoryn was appointed acting prime minister. In 2013, Udval Natsag, the minister of health, became the first woman candidate running for the president in postsocialist Mongolia and the third presidential candidate for the election year. Even though she lost to the two male candidates, her candidacy exemplified an important step in women's political participation in the country.

One barrier to women's participation in politics in postsocialist Mongolia is gender norms. Considered vulnerable and weak, women are not expected to be leaders. In addition, women also internalize gender norms and hesitate to run for leadership positions. It is also important to note that women have limited access to the financial resources needed to be nominated for or to run an election campaign; their male counterparts are prioritized and have more success in fund-raising. The candidate pool is one more factor contributing to lower women's representation in the national government. Reported growing gender disparity

in the junior leadership positions has reduced the number of qualified female candidates for higher positions.

Various measures have been taken to counter or raise awareness of gender stereotypes to enhance women's participation and representation in politics. A new election law also came into effect in 2012. It aims to increase women candidates from 15 percent in a committee draft to 20 percent during final plenary discussion. However, it was revised again in May 2016, reducing the quota for women candidates for each party to 20 percent, a move that reversed the increase passed in 2015. As a result, women took 17.11 percent of the Parliament seats in the 2016 election. Mongolian women still have a long way to go to fully participate in politics and decision making.

Religious and Cultural Roles

Research in women and religions in Mongolia is scarce, but various sources have indicated that the religious environment has changed in the postsocialist era. Mongolians have had more freedom to practice the religion of their preference. Specifically, the 1992 Mongolian Constitution granted freedom of religion, and religions that were oppressed for 70 years have been revived and resumed their roles in people's daily life. They include Lamaist Buddhism (90%), Islam (5%), Christianity (2.1%), Shamanism (2.9%), and other folk religions. Many worship centers were founded, but people living nomadic lifestyles or in rural areas have fewer formal places to worship (WEF 2016).

Historically, Mongolian women participated in religious activities. For example, women in traditionally nomadic cultures performed shamanic rituals and took the most powerful positions as shamans. Even when religions were banned in the socialist Mongolia, some women in rural areas secretly practiced Shamanism (Buyandelger 2013). More women engaged in Shamanism than men at the time, as they were not regarded as doing anything harmful.

The majority of Mongolian women are Buddhists in the postsocialist era. Some of them are ordained after making their vow of ordination—ordination for nuns started in 1993. Many make lay vows (e.g., not to kill, steal, or lie), but they are not required to shave their heads, to wear Buddhist robes, or to stay in the nunneries. They can get married, have children, and live with their families. Since 1990, women Buddhists have been actively engaged in organizing and collaborating with Buddhists at home and abroad. For example, there are Buddhist women's centers in the capital city. The Mongolian Buddhist Women's Conference

was held in 2015 to discuss experiences, prospects, and challenges in local communities, whether or not they are from rural or urban areas.

As a nontraditional religion in Mongolia, Christianity was reportedly introduced to the country during the Chinese Qing Dynasty (1644–1912), but it was banned for almost 70 years (1921–1990). It was revived and expanded rapidly with missionaries' efforts and utilization of various media since 1990. Approximately 2.1 percent of the total population is Christian, and they attend more than 600 registered churches in the country—Evangelical, Protestant, or Roman Catholic. Although pressures against Christianity have been reported by various sources, there has been an increase in the Christian population in Mongolia. Missionaries now aim to convert more Mongolians—women in particular—in rural areas. Many of these women have undergone divorces or witnessed increasing alcohol abuse in their communities and are eager to seek emotional and spiritual support.

Issues

While Mongolia has made progress in achieving gender equality since 1990, persistent poverty, gender-based violence, and discrimination against the LGBT population are major issues that require attention to the well-being of less-privileged groups and more inclusive and equal social, cultural, and political systems.

Persistent Feminization of Poverty

There are more women and children among the poor in the postsocialist Mongolia. Although a market economy undoubtedly provides more opportunities, choices, and mobility, it also facilitates redistribution of wealth, access, and resources. Industries have been privatized, and prior benefits have been halted. The unprecedented change inevitably affects the daily lives of vulnerable social groups, such as women, the elderly, people with disabilities, and children. The percentage of the national population living in poverty was 36.3 percent in 1990, 35.6 percent in 2000, and 21.6 percent in 2014. The country's GDP growth rate from 1991 to 2016 has averaged 5.8 percent, but it slowed down to 1 percent in 2016 (World Bank 2017). The national poverty rate is reported at 21.6 percent as of 2014. Rural areas have a higher rate of poverty (26.4%) when compared with urban areas (18.8%) in the same year (World Bank 2015).

Although poverty has declined when compared to prior years, it is still relatively high. On the one hand, economic

development has enabled more people to migrate to large cities, but it has also caused many of them to live in poverty, particularly those living in the outskirts with limited access to employment, education, and health care. On the other hand, the moderate economic growth fails to keep up with inflation and other cost-related changes and poses imminent danger to push people back into poverty. It is true that many Mongolians have benefited from economic development, but a deceleration of the economy, inflation, or a lack of inclusiveness in economic growth may push them back into poverty again, as they barely stay above the poverty line to begin with (World Bank 2016). The majority of the unemployed are women, and they are more likely to live in poverty if they are unable to find new sources of income.

Under socialism, Mongolian women, like their male peers, enjoyed guaranteed employment, pensions, free education, and health care. In addition, subsidized day care was available to women with children. The government also had policies to reward women who had multiple children; it gave them additional benefits, including an early retirement. With the market economy came changes in livelihood support, access to resources, unprecedented urbanization, benefits in reproductive health, food and housing subsidies, pensions, and health care. All the changes have undoubtedly created inequality at various levels, which adversely affects both men and women. Nevertheless, the gendered nature of impoverishment and its long-lasting impacts on the well-being and livelihood of women and girls are profound.

For example, women in rural areas worked on state collective farms and received structural support for their families and livelihood under socialism. In the postsocialist era, many of them have abandoned herding or migrated to cities after the state discontinued its support for nomads in areas such as means of transportation, clean water, or veterinary health. With limited access to resources, education, employment, and health care, they are more likely to live in poverty. Those remaining in the rural area, in particular those heading households or herding livestock (half of the households headed by women are poor) or having more than four children, are at a higher risk if without helpers to herd livestock or a decent number of livestock to help generate income and support them at the subsistence level.

Irrespective of the state efforts to reduce the poverty rate to 21.6 percent in 2015, as compared to 27.1 percent in 2012, one in five Mongolians still lives in poverty, which means the state government will need to further reduce

poverty through more effective policies and assistance (World Bank 2016).

Gender-Based Violence

The most common forms of gender-based violence Mongolian women experience include domestic violence and sex or human trafficking. Women reportedly account for 88.3 percent of the victims of domestic violence, and close to 40 percent of them are 15–34 years of age. Some victims have lost their lives, while many others have been injured since 2010. Social and cultural norms and victim blaming also discourage victims from reporting these cases.

UNFPA Mongolia (2016) reports that 1,356 domestic violence cases were registered in 2015, and reported domestic violence cases increased by 26 percent from the same period of the prior years. However, the government has not been able to address the problem effectively because of vague laws, the reporting requirement, and a lack of social awareness and transparency in legislative, executive, and judicial processes. For example, no law specifically prohibits intimate partner rape, and only a small number of rape cases have been prosecuted, either because of a lack of evidence or inaccessible postrape medical exams in some areas (BDHRL 2015).

One out of five women in Mongolia is a victim of domestic violence. Children and the elderly are also victims of domestic violence. Eighty people died, and 3,299 people were injured in 2015. Reported cases increased by 26 percent the same year. Violence may continue even after a divorce. Many victims are unable to find a place because of the shortage of shelters and lack of support services.

Human and sex trafficking also remain a serious problem in Mongolia. Living in a source and destination country for forced labor or sex trafficking, women and girls are vulnerable groups targeted by traffickers in the name of employment or education opportunities at home or abroad. Many have been lured, coerced, or forced into involuntary labor, sexual exploitation in local hotels and clubs, or prostitution in foreign countries.

Mongolia is currently ranked as a Tier 2 country in the *Trafficking in Persons Report 2016* released annually by the U.S. Department of State (2015). According to the report, the Mongolian government has made efforts to prosecute trafficking cases or to fund antitrafficking training. Nevertheless, it still needs to fully meet the minimum standards to eliminate trafficking, protect victims more effectively, and implement its national action plan to address the problem of trafficking.

The Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) has expressed a deep concern regarding the prevalence of domestic violence in Mongolia. The Mongolian government has taken initiatives to establish partnerships with various organizations locally and internationally to address violence against women and girls. In 2014, a hotline was enacted to provide emergency assistance to victims of domestic violence. The Mongolian Parliament revised and approved the Law to Combat Domestic Violence (LCDV) in 2016 and criminalized domestic violence (UNFPA Mongolia 2016). The battle against gender-based violence in the country will remain ongoing.

It should be noted that grassroots organizing or international partnership to combat gender-based violence has gained momentum. For example, the Start, Awareness, Support, Action (SASA) program is a nationally known community initiative aiming to address gender inequality and reduce gender-based violence through raising awareness and making changes in culture and individual behaviors. Nongovernmental organizations (NGOs), such as the National Center against Violence (NCAV), have endeavored to help prevent gender-based violence and protect victims. For instance, NCAV, a pioneer NGO in Mongolia combating domestic and sexual violence against women and children, was established in 1994 and has been involved in the prevention of gender-based violence and protection of victims. In addition, the Swiss Agency for Development and Cooperation (SDC) established a partnership with the UNFPA and cosponsored and launched the Combating Gender-Based Violence in Mongolia project in September 2016.

Challenges for the LGBT Population

The challenges for the LGBT population in Mongolia are culturally specific but also exist within the larger global anti-gay context. Words to describe sexual orientation and nontraditional sexual relationships were nonexistent in the Mongolian language and public life in socialist Mongolia; scarce documented studies or literature could be found about gays and lesbians. The term *LGBT* is relatively new to the general public (UNDP 2014). While the younger generation is more open to LGBT topics and individuals, the older generation tends to be more resistant.

The first LGBT center was established in 2007 and held the first gay pride parade in 2013. Its activities have been curtailed by cultural and traditional biases against the LGBT population. Social stigmas, fear of retaliation, and absence of pertinent legal protection discourage LGBT

people from coming out, resorting to law enforcement, or seeking health care assistance, for example, for depression or sexually transmitted diseases. Nationwide, there is only one gay bar located in the capital city. The exact number of the LGBT population is unknown, and few studies have been done on the status of the population, including employment, access to health care, poverty, and violence.

NGOs and LGBT people in Mongolia have reported discrimination based on sexual orientation and gender identity. For example, LGBT employees tend to experience more discrimination or unfair treatment after revealing their sexual orientation or gender identity in the workplace; however, there are no specific legal ramifications for employers or discriminatory practices because there is no law prohibiting discrimination on the basis of sexual orientation or gender identity as such. Violence against LGBT individuals in public and private spaces is not uncommon. LGBT youths tend to encounter violence from family members. Some law enforcement officers reportedly harass LGBT individuals who report alleged crimes. Social media also reinforce stereotypes of LGBT individuals, including HIV/AIDS (BDHRL 2015). Given the challenges on social, cultural, and institutional levels, it is incumbent on local and international communities to jointly create a healthier social, cultural, and legal environment for the LGBT population in Mongolia.

Myanmar

Overview of Country

Myanmar is a tropical country bordered by Bangladesh, India, China, Laos, and Thailand. It is a complicated country, starting with the name. The term *Myanmar* derives from the literary form of the language, while *Burma* comes from the spoken form (Dittmer 2008), in the language of the dominant ethnic group, the Barmars. An election in the early 2000s allowed a new government to be created in March 2016. The largest population is the Burman, or Bamar, people who have dominated or attempted control over the Karen, Shan, Rakhine, Mon, Rohingya, Chin, Kachin, and other minorities, leading to ethnic tension, intermittent protests, and separatist rebellions (BBC 2015).

The history of Burma goes back to the Mon people who settled in 1500 BCE. The Mon introduced Buddhism to those living there. Conquered by the Burman leader U Aungzeya in 1757, the Mon have since been in conflict with the rulers of Burma. The Mon and the military agreed to a cease-fire in 1995, but there is still active conflict. The Shan people ruled from 1287 until 1604, when the Burman king Anaukpetlun rose to power. Conflict resulted in a British invasion in 1885. "Under colonial rule the Shan states were administered under a separate system as protectorates, and the British recognized the authority of the Saophas, who enjoyed a high status. But the rule of Ne Win and the dreaded State Law and Order Restoration Council (SLORC) brought ethnic cleansing and economic collapse to the Shan, who number approximately 6 million. Many of them now live across the border in Thailand" (Rigg 2006).

An important people in the history of Burma are the Karen. The British fought with them in World War II against the Japanese, but they revolted in 1948. The Karen National Union (KNU) is a large insurgency against the military dictatorship. Approximately 20,000 KNU members fought during the 1980s, but by 2006, there were less than 4,000 opposing a much larger Burmese army (Rigg 2006). Currently, Myanmar is divided into 7 states and 14 divisions, representing demographic concentrations of the 7 main ethnic groups: Burman (majority), Kachin, Karen (and subset Karenni), Mon, Shan, Chin, and Arakan. As several authors point out, "Demands for federalism are as old as independence, and armed struggles for

self-determination started as early as the 1950s” (Betkerur and Palkar 2013, 1).

Burma is one of the least-developed economies in the world, one of the poorest countries in Asia, with approximately 26 percent of the country’s 51 million people live in poverty (CIA 2017), and has the highest number of stateless people of any nation. It is also one of the most corrupt, receiving a 22 out of 100 transparency score and a 147th ranking of 168 countries for corruption from the Transparency International organization (Transparency International 2015). There are 135 national groups: the Barmars (58%), the San (9%), and the Karen (7%) are the majority, and around 1 million Muslim Rohingya live beleaguered in a country that is 89 percent Buddhist.

A former British colony, Burma won independence in 1948 and has been rife with violently changing political landscapes ever since—coups and counter-coups in 1958, 1962, 1988, to name but a few. Results of a 1990 election were ignored, and the 2010 elections were boycotted by the National League of Democracy because it was clear they would not be free. In November 2015, the National League for Democracy (NLD) under Aung San Suu Kyi won in what some thought were flawed elections that did not improve human rights, as more citizens were incarcerated, more laws were used to silence dissent, and the oppression of the Muslim Rohingya increased.

Burma’s history is sadly a record of the government killing, arresting, and relocating its own people. For example, in 1988, thousands of unarmed demonstrators, students, and monks protesting the authoritative government—known as the 8888 Uprising—were attacked. In 1989, tens of thousands were “forcibly evicted” from cities where they were active in antigovernment protests. In May 2003, the Depayin Massacre occurred when the government attacked a National League for Democracy convoy, killing 80. And in 2007, in response to mass demonstrations, live fire was used on the civilians gathered, resulting in 200 people being killed. Muslims have been the targets of official violence in 1978, 1997, and 2001, and in June 2012, 5,000 Rohingya houses were destroyed by security forces, many lost their lives, and 30,000 Rohingyas became homeless. Between June 2013 and March 2014, more than 200 Muslim Rohingyas were killed and another 140,000 lost their homes (Brooten, Ashraf, and Akinro 2015, 719). Death also comes often to Burma through natural disasters. Burma is the “most at risk” country in Asia, as it is

subject to floods, cyclones, earthquakes, landslides, and tsunamis. Between 2002 and 2012, three cyclones affected more than 2.6 million people, floods affected 500,000 people, and two major earthquakes affected more than 20,000 people (UNOCHA 2012).

The most recent UN *Human Development Report* describes Burma’s statistical place in the world. “Myanmar’s HDI value for 2015 is 0.556—which put the country in the medium human development category—positioning it at 145 out of 188 countries and territories. Between 1990 and 2015, Myanmar’s HDI value increased from 0.353 to 0.556, an increase of 57.4 percent. Between 1990 and 2015, Myanmar’s life expectancy at birth increased by 7.4 years, mean years of schooling increased by 2.3 years and expected years of schooling increased by 3.2 years. Myanmar’s GNI per capita increased by about 563.5 percent between 1990 and 2015.” (UNDP 2016).

LGBT people are outlawed. “The legacy of British law means that same-sex sexual relations are illegal, a corrupt police force is able to harry them in their everyday lives; and LGBT people cannot respond legally for discrimination and abuse inflicted by family members, employers, teachers, and others in their social circles” (Chua and Gilbert 2015, 2). The first gay pride celebrations were held in May 2012. Instead of a parade, about 400 people attended an evening of music in a hotel in Rangoon. According to a member of the LGBT community in Burma, “In the past we didn’t dare do this. We’ve been preparing to hold this event for a long time . . . and today, finally it happened” (BBC 2012).

Girls and Teens

In this male-dominated world, adolescents are expected to be seen and not heard, and young women are expected to obey their fathers (MacGregor 2015). Class determines access to education: only 29 percent of children from households in the poorest quintile were enrolled in secondary school, compared with 80 percent of those from the richest quintile. Furthermore, 33 percent of children from households in the poorest wealth quintile were underweight compared to 14 percent of children from the richest quintile (Pyne 2015, 1).

Rape

Violence is a prevalent weapon of war. In six months alone, 81 cases of rape were documented in one state in 2011, but

the perpetrators are immune from prosecution (Burma Campaign 2014). The United Nations has described the situation as “particularly alarming” for both women and young girls. “Women are systematically raped on a daily basis when they are used as forced labor, when taken as guides for the military, when carrying out daily chores such as collecting vegetables for cooking, when looking after cattle in their fields, gathering firewood or bamboo shoots outside their village, or walking to markets and nearby villages” (Women’s League of Burma 2008, 75). Because it is a crime to “disgrace the army,” head chiefs of villages are reluctant to report the assaults, even if they are known to them. A pilot study to try to address the needs of victims of sexual violence found many barriers: shyness; fear of others’ opinions, such as the scolding of parents or being looked down upon by community members; shame; and concerns that they may not receive help. A frequent remark was, “They are not telling . . . other people because they are shy, afraid other people look down [on] them, afraid [that] other people don’t care [about] them or help them.” Others reiterated: “Some are feeling afraid so much” (Tanabe et al. 2013, 8).

Child Labor

Twenty-four percent of children ages 10–17 were reported to be in the labor force, according to a 2014 census. “The government concedes that at least half a million children are working and out of school, but campaigners reckon that number could be much higher” (Lewis 2015). Too often, employers regard employing children as a benefit to the life of the child and their family and believe working in a tea room or factory is better than being exploited in the sex trade. One project, MyMe, is trying to make a difference and has equipped buses around Myanmar to educate children being exploited in the tea room trade. Currently, about 750 children are being educated through these mobile schools (MyMe Project 2014).

Forced Marriages, Human Trafficking, and Underage Sex Work

China’s one-child policy of has resulted in a need for wives. Forced marriages, where Burmese girls and women are sold to be wives to men in China, sometimes by family members, is just one form of human trafficking that young women in Burma might fall victim to. “There were 306 trafficking victims in 2010; 265 in 2011; 261 in 2012; 256 in 2013; and 309 in 2014. Forced marriage was the top cause

of human trafficking, with 72 cases, while there were 29 forced labor cases and 22 cases of women being forced into prostitution” (AP, Forced Labour Net 2015). Superstition makes virginity a premium, as it is thought that having sex with a virgin leads to long lives and curing AIDS. Because parents are sometimes involved and girls are stigmatized, there is often no way out. “Some 0.45 percent of Burma’s women between 15 to 49 years of age—an estimated 40,000 to 80,000—are engaged in paid sex work, according to government and United Nations figures released in 2013” (BurmaNet News 2015).

Education

The Curriculum Project, which is a nonprofit organization that supports educational efforts with freely available texts and other resources, reports there is an undervaluation of education when 25 percent of government spending goes to the military and only 1.3 percent to education. Three of ten children are not in school, almost 75 percent do not complete primary school, and half are unable to continue to secondary education. The military controls the curriculum and has closed the universities for much of the last 25 years. Teachers have to work second jobs or ask their students’ parents for more money. Female literacy is estimated at 91 percent, despite the obstacles facing them (Curriculum Project 2012). In Myanmar, 22.9 percent of adult women have reached at least a secondary level of education compared to 15.3 percent of their male counterparts (UNDP 2015).

Primary Education

Burma’s children are relentlessly hopeful, despite the challenges. As part of a project studying the attitudes toward education of the refugees fleeing Burma between 2013 and 2015, one student said, “It depends on me. If I try hard, if I trust myself, I don’t waste my time for useless reasons, if I focus on my education, the dream will become true one day, I hope. The chance will come, it just depends on me trying” (Carpeño and Feldman 2015, 420). The educational systems are a hodgepodge of government schools, monastic schools, and schools run by opposition groups, including the Mon and Karen people, with many students falling between the large cracks in these makeshift systems. This is often due to lack of native-language education, poverty that drives many children to work, sexism that does not prioritize girls’ educational attainment, and an ongoing war between factions.

The tension between educating in the student's language and developing ethnic pride and preparing them to be able to earn a living as a governmental functionary, for one example, results in disconnects. In the example of Karen schools, a distinctly Karen educational system and curriculum, while instilling ethnic pride and sense of identity, does not prepare students to integrate with the government system or to attend university within "a militarized state bent on forced assimilation" (Lall 2014, 312). The Mon, conversely, "follow the government curriculum, with extra classes in Mon language and history-culture, graduates are able to matriculate and enter the nationwide tertiary education system" (298).

A recent article reported that while there are officially 41,000 schools and about 276,000 school teachers, as well as 23 education colleges and two schools that produce 10,000 teachers annually, most students are learning from teachers with multiple grades in poor buildings with thin walls. "It is claimed that 81 percent of children complete the full cycle of primary education that ends at the fourth grade. However, it is acknowledged that there are disparities in access to education between states and divisions. For example, the net enrollment for primary schools in Kachin State is 94.8 percent compared to 61.2 percent in Shan State East, and 59 percent in Chin State" (Hardman et al. 2014, 1).

Hardman's group found that teaching methods are purely rote, with the teacher reading a paragraph and making the students repeat it. Teaching behaviors rarely observed in a recent study include peer tutoring, encouraging questions, identifying special needs, group work, teacher's use of open-ended questions, equal feedback to girls and boys, and the teacher moving around to interact with pupils (12). Teacher training is inadequate, and most students drop out long before the end of primary school. One problem is that the language of instruction is too often not the language of the pupils, and there are extremely large class sizes with entrenched rote learning. "Most monastic schools try to follow the national curriculum but hardly have any resources such as books or even enough tables, chairs, and blackboards" (Lall 2011, 219).

Secondary Education

According to UNESCO, only 50 percent of Burma's children are enrolled in secondary education. Even primary schools would require the sacrifice of half of a middle-class salary per month, and transportation to the schools is also an issue. "While both genders are negatively affected by these

costs, girls often pay a heavier price. As Lway Aye Nang, the secretary-general of Women's League of Burma (WLB), told IPS News, "In both the cities and in rural areas, there is a greater likelihood that parents may keep their boys in school and take the girls out. Family members do not support daughters going to school if there is limited funding."

Children of ethnic minorities are also discriminated against in terms of access and also, as noted earlier, because the language of instruction is unlikely to be the language of the pupil: "Some of the ethnic minorities find it difficult to preserve their cultures and retain their languages." School-aged children are often working to support family members. In Burma, child labor, as a recent report stated, "Is a pillar of the economy. And at this unique moment in the nation's history, that economy is set to explode. In international rankings, Myanmar is often cast alongside nations mired in anarchy or tyranny. Maplecroft, the U.K. risk analysis firm, ranks Myanmar's child labor problem as the worst on the planet, worse even than in North Korea or Somalia" (Curriculum Project 2012).

Special Needs Education

The first Disability Survey (2008–2009) found that the prevalence of those with a disability is about 2.3 percent and that only 50 percent of people with a disability have gone to school. In 2011–2012, there were 9,738 students with disabilities in basic education primary schools, 11,536 in basic education middle schools, and 47 in basic education high schools. "For many of Myanmar's disabled, lack of access to schooling causes enormous difficulty in adult life, further disadvantaging already marginalized people" (Solomon 2015). While some educational reformers are pushing for inclusive education, disabled children are often not allowed to attend government schools and are offered few alternatives. Myanmar only has about 15 special education schools for the deaf, blind, and physically and intellectually disabled. Only about 0.5 percent of the country's school-aged children living with a disability are enrolled in government-run schools (Solomon 2015).

Tertiary Education and Job Training

Students have often protested governmental actions, and the government has repeatedly and frequently closed down higher education. Universities have been perceived as dangerous by the government, which has repeatedly reacted by closing universities and relocating them away from urban areas (Lall 2011, 222).

Health

The Health Information System Working Group's *The Long Road to Recovery* (2015) describes the difficult conditions in Eastern Burma. Burma ranks the lowest of any country for health care for their citizens. A *Lancet* study outlined their health indicators—the worst in the world—with only a 56-year life expectancy, a 40 percent rate of stunted children, and 50 percent of all malaria deaths in Southeast Asia. Rural Burma is almost wholly without health care services, and these lack supplies, while urban health care centers are corrupt, with patients having to give bribes to staff and pay for food and cleaning themselves, even at public facilities. Leading causes of death are AIDS, septicemia, general injuries, fetal disorders, liver disorders, respiratory disorders, intrauterine hypoxia, health failure, and tuberculosis (9). To summarize some of the results reported in a *PLOS One* article, about 10 percent of the respondents felt they were in poor health, 5 percent were depressed, 3 percent had malaria, 11 percent of the children were malnourished, and 37 percent of the parents gave their children vitamin A supplements and deworming medications. Eleven percent of women in their childbearing years were malnourished, and 52 percent reported no postnatal care. Polled about human rights violations (HRV), “one in nine households experienced at least one HRV in the past year and four percent reported two or more HRVs (Parmar et al. 2015, 11), including forced labor, confiscation of food, gunshot wounds, and landmine injuries.

Access to Health Care

Access to health care is limited in Myanmar, particularly in rural or contested areas. In Myanmar, charity hospitals serve the poor. There are private nonprofit clinics run by community-based organizations and religion-based societies, which also provide care but “the information on private facilities both for the rich and the poor is limited” (Latt, Cho, Htun, Saw, Myint, Aung, Aoki, Reyer, Yamamoto, Yoshida, and Hamajima 2016, 126).

Maternal Health

“Complications arising from unsafe terminations are the third leading cause of maternal deaths after post-partum hemorrhage and eclampsia,” according to the government's 2006–2011 National Health Plan. The latest survey by UNICEF and the Department of Health in 2005 shows that Myanmar's maternal mortality ratio (MMR) is

persistently high at 316 per 100,000 live births. Nearly 10 percent of all maternal deaths are abortion-related. Pansy Tun Thein, the assistant representative of the UN Population Fund (UNFPA) in Myanmar, said the government recognized that abortion-related deaths are one of the leading causes of maternal mortality. “The government is currently promoting the reduction of maternal mortality. It's high on their agenda and abortion is one of the issues being addressed through improved quality services for maternal health,” she told IRIN (Women on Waves 2016). “More than half, or about 54 percent of women have an unmet need for contraception” (HISWG 2015, 29). The key challenge facing many mothers and their children is limited access to qualified antenatal and postnatal assistance. Figures differ, with the British Red Cross saying that almost half are not attended by a skilled health worker, but another resource stating that three-quarters of new mothers had an attendant. “About 60% of women surveyed reported attending at least one antenatal care visit and almost 80 percent of new mothers breastfeed for six months” (HISWG 2015, 6). In 2013, about 17 percent of children under five years old suffer from acute malnutrition (HISWG 2015, 6).

Diseases and Disorders

Health issues abound, and AIDS rates are high. HIV in Myanmar is concentrated among men who have sex with men, people who inject drugs, and female sex workers. HIV prevalence in the adult population aged 15 years and older was estimated at 0.54 percent in 2014, and 9,000 new cases were reported (Ministry of Health 2014). There is a very high occurrence of food- or waterborne diseases, such as bacterial and protozoal diarrhea, hepatitis A, and typhoid fever; vector-borne diseases, such as dengue fever, malaria, and Japanese encephalitis; water contact diseases, such as leptospirosis; and animal contact diseases, such as rabies. The World Health Organization (WHO) reports the top 10 causes of death as follows: stroke (12%), lower respiratory infections (9%), ischemic heart disease (7%), tuberculosis (6%), chronic obstructive pulmonary disease (4%), cirrhosis of the liver (4%), diabetes (3%), asthma (3%), diarrheal diseases (3%), and HIV/AIDS 2.6% (WHO 2015, 2).

Employment

In Myanmar, female participation in the labor market is 75.2 percent, and it is 82.3 for men (UNDP 2015). Women often work in agriculture, unpaid on their own farms, or as

laborers on plantations and farms. They also process agricultural products, fish, or gather from the forests. Women encounter multiple barriers and forms of discrimination, including barriers to accessing or owning land, participating in decision-making processes regarding land, and accessing resources for resolving disputes. Reports indicate that limited education; the lack of resources, time, and money; internalized gender roles; and social and cultural inequities all exacerbate these barriers for women's employment in Myanmar (Transnational Institute 2015, 6). A recent article described some of the barriers for women in employment: males dominate local government, and women are made to feel dismissed in village discussions and decisions as well as within the agricultural instruction that might be available. Land and land rights are connected to women's employment in Myanmar and often to other rural inequalities, including lower wages. As Faxon et al. point out, widows are particularly vulnerable to losing their land; titles rarely include the names of wives, so in-laws may take ownership of land rights (440).

Furthermore, a 2011 Gender Development Index survey found that women and girls frequently perform unremunerated tasks, including cooking, cleaning houses, washing clothes, caring for children, caring for the sick and elderly, fetching water, collecting firewood, purchasing food and supplies at the market, and delivering food to those working the fields. As Minoletti writes,

The types of work that women typically perform to raise income and/or produce food for family consumption are those that tend to be located closer to their house than the types performed by men. Also, self-employed women typically have smaller start-up capital than self-employed men. . . . In Myanmar, in 71.9 percent of households that do not have a source of drinking water on their own premises a female aged 15 or over was found to be the person usually responsible for collecting water. (17)

Family Life

One of the few quotidian studies of Burma provided some stories to shed light on the everyday negotiations of the people of Burma. One narrative, for example, describes how the most common method for families to supplement their income is to establish a home-based food stall or small shop. Such home-based businesses allow for greater flexibility, as owners can simultaneously care for children

and perform household chores, while also avoiding government regulations and taxes. For instance, one woman “whose husband was employed as a night guard at a construction site temporarily camped out at the site where she sold snacks and betel nuts to the construction workers while breastfeeding her infant and taking care of her other children” (Thawngmung 2011).

The author described how, even if these shops do not make a profit, the leftover food can be used to feed the family. Families often have gardens, raise pigs, and do everything they can to be self-sufficient and outside the influence of governmental policies and interference. Three generations often live together to share living space and contribute to the common good. Thawngmung gives many examples of creative resourcefulness (650).

Politics

An election in 2010 started Burma down the road to democracy. Decades of military rule, an abundance of factors, including poverty; a plethora of stateless ethnicities; environmental, climate, and political turmoil; a tradition of corruption; educational deficits; and religious conflicts, have all contributed to a chaotic political climate. The election in November 2015, however imperfect, means that this is an unfolding story, and anything true today may change dramatically tomorrow.

While the new government elected in 2015 is a move in the right direction, *The Economist* reports, “The army controls defense, frontier and home-affairs ministries. That will not change after April 1st” (2016). In Myanmar, 4.7 percent of parliamentary seats are held by women (UNDP 2015). The Asia Foundation reported on the most recent election, saying that the number of women has increased 14.5 percent in all elected members of Parliament, mostly members of Aung San Suu Kyi's National League for Democracy. These 145 women, compared to the incoming male parliamentarians, are younger, more highly educated, and from every career—business leaders, farmers, doctors, lawyers, and educators. One study of previous female parliamentarians reported various barriers to success: “82 percent of respondents saying that lack of support from other women ‘very much’ discouraged them from entering politics.” The study found that “three-quarters of women respondents felt that men make better political leaders than women” (Ninh 2016). At the subnational level, women are underrepresented. There are “no women township administrators anywhere, and women account

Women's Voices

Aung San Suu Kyi

Aung San Suu Kyi is an activist from Myanmar (Burma) and is the winner of the 1991 Nobel Peace Prize. Starting in 1988, she began to speak out against human rights violations in her home country. In 1989, she was placed under house arrest by the government and spent 15 of the next 21 years in custody. She was finally released in 2010. Her political party, the National League for Democracy, is currently in power in Myanmar. As the new leader of Myanmar, San Suu Kyi says her priorities will be “the rule of law, internal peace and the amending of the Constitution” (Mydans 2015). She believes her aspirations reflect those of her people. She says, “I’m confident the great majority of the people want peace. . . . [T]hey do not want to live on a diet of hate and fear” (Keane 2015).

for only 19 of the 16,743 ward/village tract administrators in government-controlled areas of Myanmar” (Minoletti 2014, 10–11). The incoming women will be fighting an uphill battle in a culture in which women’s voices are not impacting daily life and where there is an omnipresent military that is more interested in its continued power than benefits to the citizens of the country.

Women’s Nongovernmental Agencies

Interestingly, an Internet search of “nongovernmental agencies/Myanmar” mostly retrieves organizations based in Thailand, Australia, and other countries focused on helping refugees. There are, however, more than 30 women’s

groups under the umbrella of Women’s Organizations Network of Myanmar (WON) that advocate for women, organize events to highlight violence against women in Myanmar, and do capacity building for women’s groups. The Alliance for Gender Inclusion in the Peace Process (AGIPP), for example, advocates for increased representation of women in peace-related decision-making roles in Myanmar (Snaing 2016).

The Karen Women’s Organisation, in existence since 1949, has more than 49,000 women. There is a Gender Equality Network, which works for greater gender equality through research, networking, and training women. The Women’s League of Burma (WLB) organizes workshops for women and men on negotiation and peace building. There is also the Mon Women’s Organization (MWO), which especially works for the education and skills needed by women around Mon villages inside and on the Thai-Burma border, based on Buddhist teachings. The organization also teaches ancient Mon history to make it more accessible. Another women’s group is the Rainfall Gender Study Group, which was created to promote women’s rights and women’s roles and to increase gender awareness.

Religious and Cultural Roles

Muslims constitute a religious minority in Burma and are violently oppressed by certain elements of the Buddhist peoples. The majority of people in Burma are Buddhist, but Buddhism is not necessarily one coherent religion. There are nine official sects in the monastic community (*sangha*) of Burma, and there are individual opinions and interpretations (Gravers 2012, 2). Women become nuns for many reasons, but some suggest that this can be one way for a girl from a poor family to access an education (Sinclair-McCartney 2016). Women who become nuns cut their hair in a ceremony, which is often a source of dismay for their relatives. Nuns practice obedience and discipline, fasting, and serving the monks, and they preside at ceremonies such as funerals and pagoda consecrations. They hold traditional roles, often walking behind and eating after the men (Kawanami 2013, 100).

The monks provide religious education and have been in stalwart opposition to the military rule in Burma. “The monk-led protests, known as the Saffron Revolution, were turning points in Burma’s modern history. Unlike the 1988 uprising, during which hundreds if not thousands of peaceful demonstrators were gunned down, the uprising in 2007 was rather short-lived but also had a lasting

impact.” However, the 300,000–400,000 monks are divided into those that hurt the regime, who are sanctioned, and those “who appear to take a neutral stance or promote nationalism and narrow-minded religious hatred [who] are allowed to operate freely” (Zaw 2015).

Astrologers, palm readers, and portents are the norm. Thawngghmung, who offered up a recent study of daily life in Burma gave this example from one woman:

She consults a number of astrologists two or three times a month on issues ranging from whom to choose for a spouse, her continued job prospects, to choosing names for her new-born relatives and picking appropriate dates for special events. She recalled that she was once told by a palm reader to make an offering of 23 ears of corn (she was 23 years old back then) at the pagoda in order to ward off an impending danger predicted to befall upon her. She was living in Pegu city, a two-hour bus ride from Yangon, and, because there was no corn in Pegu, had to catch transport early in the morning to search for the corn at vegetable markets in Yangon. She had to find ears of just the right size—small enough that they could be held in a single bunch for her offering.

Because she had to visit a number of different markets in different locations, it was already getting dark by the time she arrived back to her home in Pegu with the appropriate offering, which she brought directly to the pagoda. She nonetheless went to bed happy after her long day, content in the knowledge that danger had been averted. (653)

Thawngghmung claims that “the decisions taken by many people, from senior military officials to poor farmers, are often heavily influenced by advice offered by astrologers” (653). Mikael Gravers, who has written many articles and books on Burma, in studying how both the military and Aung San Suu Kyi explain their goals in terms of Buddhist principles, discusses how the military used numerology, astrology, and prophecy to determine the timing of the constitution, the move to the new capital, and the sentencing of a prisoner (12). The struggle between the military rulers and the opposition are both articulated in religious terms: “The monks and Daw Aung San Suu Kyi have used Buddhist concepts in order to translate and transmit ideas of democracy, human rights and human security into a Burmese cultural context. The opposition thus uses Buddhism as a medium for critique of the regime, while the generals use Buddhism as a means to legitimize their power and rule” (2).

Issues

Violence against Women

A study released in 2015, which involved in-depth interviews with 38 women, found that domestic violence victims “experienced mental, physical, and sexual health consequences, including blurred vision, broken bones, stress, depression, and social isolation. . . . [N]one of the participants received medical assistance for . . . problems that resulted from violence. Similarly, no participants were able to negotiate successfully for condom use, sometimes resulting in STI or HIV transmittal from a husband’s extra-marital relations” (Faxon, Furlong, and Phyu 2015, 467). Many women are victims of sex trafficking. They are sent to China and become involuntary sex workers or Chinese wives. The stateless ethnic minorities are particularly vulnerable. Human Rights Watch (HRW) claims “widespread sexual violence perpetrated by Burmese soldiers has been a hallmark of the culture of abuse and impunity in Burma’s decades-long civil wars with its ethnic groups. . . . [T]he army continues to shield its soldiers from prosecution for crimes committed throughout war zones in the country’s north and east” (2016). Victims are told by the soldiers not to reveal the rapes, and “the rapes have taken place in different parts of the country, involve many different battalions, are often gang-rapes, and are connected to conflict areas, suggesting that the practice is widespread and part of military tactics” (Burma Campaign 2014, 2). “Recent cases of women and girls being raped by soldiers from the government’s forces include the rape of a 12-year-old girl in front of her mother and of a disabled woman. Many of the victims were gang-raped, and many were killed afterward” (Burma Campaign 2014, 1).

Child Soldiers

Burma has the highest number of child soldiers in the world, according to HRW. Photojournalist Spike Johnson, under the aegis of the Pulitzer Center on Crisis Reporting, produced a slideshow of these child soldiers. The accompanying report states,

Boys are kidnapped in their early teens, or convinced to join the Tatmadaw (Myanmar army) and armies of pseudo independent states, with the lure of a small but steady income. Military men or corrupt civilian administrators faced with filling quotas will often forge the paperwork of minors, allowing them to be admitted

into official recruitment centers. They're forced to fight frontline battles in Myanmar's civil wars to act as porters for heavy equipment, and to walk remote fields acting as human mine detectors. (2015)

HRW describes the pressures brought to bear to try to force the government to release these children to their families, but it is impossible to know how many children still serve.

Role of Technology

Phandeeyar, a civil society organization focused on technology, estimated there were approximately 6 million Facebook users in Myanmar in 2015, which is partially a result of the low cost of smartphones and SIM cards (BurmaNet News 2015). In the most recent election, this translated into deaths from unwarranted but shared Facebook accusations of murder and rape, with the government cracking down on some but not others. On the other hand, smartphones and social media have frequently resulted in better educational opportunities and health care. One report stated that, "in 2014, Myanmar had the lowest revenues for mobile learning in the region; by 2019, it will be outspending six other countries" (Adkins 2015, 9). And *National Geographic* reported on a new tool, Koe Koe Tech, a health care systems provider for health institutions and the greater public of Myanmar. "In a nation of 4 doctors per 10,000 citizens, mobile phones represent a powerful instrument to overcome state capacity by providing healthcare information, advice, and feedback in rural and urban areas." For example, people can access technology like Koe Koe Tech to find doctors, medications, and health information (Bosler 2015).

N

Nepal

Overview of Country

Nepal is a landlocked nation in South Asia bordered by India to the south and China to the north. Nepal is a geographically and ethnically diverse country, with archeological evidence showing humans have lived in the Kathmandu Valley for more than 10,000 years. It has a total surface area of about 56,000 square miles (147,181 sq. km) and is home to 8 of the world's 10 tallest mountain peaks, including the tallest peak—Mount Everest at 29,035 feet (8,850 m). Nepal is broadly divided in three geographic areas with multiple climate zones extended in bands across the country as altitudes increase. In the south, the Tarai region consists of low flat river plains and subtropical and tropical climates. The hill region has multiple mountain ranges and a temperate climate. The mountain region is composed of the Himalayas in northern Nepal and experiences subalpine and alpine climates.

The modern era of Nepali history is marked by the beginning of a unified state under the Shah monarchy in 1768 by Gorkha ruler Prithvi Narayan Shah. Following the Anglo-Nepalese War (1814–1816), Nepal maintained independence, and treaties with Great Britain established the country's boundaries. The Nepali government was ruled by hereditary prime ministers, called Ranas, until 1951, when a cabinet system with political parties was brought into the

governmental system. Then, in 1960, during the Panchayat period, the cabinet was dismissed until 1990, when a democratic system as part of a constitutional monarchy was established (CIA 2017).

The last decade of the 20th century and the beginning of the new millennium were marked by political instability and conflict in Nepal. Political tensions and volatility culminated in a decade-long civil war known as the Maoist People's War (1996–2006). During this period, the Nepali government had several different prime ministers, and in June 2001, 10 members of the royal family, including King Birendra and Queen Aishwarya, were killed by Crown Prince Dipendra before he shot himself. Over the next few years, there was an increase in violence until a temporary cease-fire in 2003 which was followed by another uptick in violence. In 2005, King Gyanendra reinstated a total monarchy and then reinstated the Parliament in 2006. In November 2006, the Maoists and the government signed the Comprehensive Peace Agreement, formally ending the war (BBC 2016). An interim constitution was adopted in 2007, and in 2008, the Constituent Assembly formally declared Nepal to be a democratic republic, abolished the monarchy, and elected the first president, Ram Baran Yadav. Eventually, in 2015, the Parliament passed a new constitution that Nepal currently operates under. Nepal's state structure consists of 7 provinces and 75 districts.

Nepal is among the poorest countries in the world. Approximately one-fourth of the population lives below

the poverty level, but the number of people living below the poverty line has decreased from 42 percent of the population in 1996 (UN Women 2017). Agriculture is the core of Nepal's economy, comprising nearly 30 percent of the country's gross domestic product (GDP) and providing a living for 70 percent of the population. Services make up 50 percent of Nepal's GDP, and industry comprises 13 percent. The most common industries in Nepal are tourism, carpet textile production, rice, jute, sugar, oilseed mills, and cigarette, cement, and brick production. Remittances are another significant component of Nepal's economy, accounting for as much as 29 percent of the GDP (CIA 2017). In 2014, Nepal and India entered trade agreements to work to increase Nepal's hydropower potential, a potential economic area to grow. In the spring of 2015, Nepal was struck by a massive 7.8 magnitude earthquake that resulted in more than 8,000 deaths and an estimated economic impact of USD\$7 billion (Kumar 2017).

As of 2016, the population of Nepal is 29,033,914 (CIA 2017). In the 2011 national census, there were 125 different ethnic groups and 123 languages reported. The largest ethnic group in Nepal is the Chhettri people at almost 17 percent of the population. This is followed by the Brahman-Hill people (12%), Magar (7%), Tharu (6.6%), Tamang (5.8%), Newar (5%), Kami (4.8%), Muslim (4.4%), Tadva (4%), Rai (2.3%), Gurung (2%), Damai/Dholi (1.8%), Thaku (1.6%), Limbu (1.5%), Sarki and Teli (1.4%), Chamar/Harijan/Ram (1.3%), Koiri/Kushwaha (1.2%), and other ethnicities totaling 19 percent of the population (CIA 2017). The official language of Nepal is Nepali, which is spoken by almost 45 percent of the country. Other significant spoken languages include Maithali, Bhojपुरi, Tharu, Tamang, Newar, Magar, Bajjika, Urdu, Avadhi, Limbu, and Gurung. Hinduism is the prominent religion of Nepal, being practiced by 81 percent of the population. Buddhism (9%) is the next most commonly practiced religion, followed by Islam (4.4%), Kirant (3%), Christianity (1.4%), and other (0.5%) (CIA 2017).

Broadly speaking, Nepali culture is influenced by a strong patriarchal culture, with women having unequal status in many areas, including literacy and education, employment, health, and law, as well as in the prevalence of sexual and domestic violence. The lives of women and girls in Nepal are shaped by a variety of factors, including ethnicity, class, religion, and location, which result in different cultures and customs as well as different levels of vulnerability. Anthropologists have distinguished two main areas that ethnic groups fall under, Tibeto-Burmans and

Indo-Aryans. While discrimination based on caste is illegal in Nepal, it is still in practice, and women and children's caste status, particularly being a member of the Dalit, or untouchable caste, can impede access to education, health care, and economic opportunities (UNICEF 2006).

Women in urban areas have greater access to basic resources than those in rural communities, with women from the mid and far western regions facing the most barriers. Since the 1970s and the rise of a global focus on development programs to support women, Nepal has seen an influx of funding and organizations, such as the UN Women program and UNICEF, as well as the growth of national nongovernmental organizations (NGOs) and local organizations working on issues ranging from education, to health care, to property rights.

Over the past several decades there have been positive indicators for women's status in Nepal, such as a reduction in infant and maternal mortality rates; however, much work remains. Women and children were greatly impacted by the Maoist insurgency. The war resulted in more than 15,000 deaths, of which 8 percent were women and 3 percent were children (Malla 2011, 58). In 2014, the UN Development Programme (UNDP) ranked Nepal 145th out of 188 nations based on the Gender Inequality Index (GII; 0.548) (UNDP 2017).

Girls and Teens

Girls' everyday life in Nepal is shaped by ethnicity, class, and location. Girls across Nepal have higher mortality rates than boys for children aged 1–4, have less access to education, and have household responsibilities, such as cleaning, cooking, and helping to care for siblings (UNICEF 2006). In rural areas, girls are additionally expected to gather water and firewood or fodder and to participate in agriculture. The literacy rate of women in Nepal is 53 percent, while for men it is 76 percent, and the school life expectancy for girls is 13 years. Child labor is common in Nepal; in 2008, 34 percent of children ages 5–14 were engaged in child labor. A 2006 estimate stated that more than 127,000 children perform labor as domestic workers, factory workers, bonded laborers, and rag pickers (UNICEF 2006). It is the societal expectation that girls will marry and have children. Child marriage is still practiced in Nepal, despite the law stating the minimum age for marriage is 18 with the permission of a guardian and 20 without. Thirty-seven percent of girls marry before the age of 18, and 10 percent marry before the age of 15 (HRW 2016).

Health

The 2016 estimated infant mortality rate in Nepal was 28 deaths for every 1,000 live births, and 30 percent of children under the age of 5 years are underweight (CIA 2017). Common health threats to Nepali children are malnutrition, diarrhea, and acute respiratory infection. As girls age, an additional health barrier they face is around menstruation. Across Nepal the practice of *chhaupadi* continues to varying degrees, despite it being outlawed in 2005. *Chhaupadi* are centuries-old customs linked to the Hindu religion that dictate the mobility and interactions women and girls can have while on their periods. In the most extreme instances, girls and women are sent to live in cowsheds during the times they are menstruating, with limited access to food and water. Other forms of this practice include restrictions on what women can eat, where they can go, and whom they can interact with or touch while menstruating (Hodal 2016). This practice is most prevalent in the mid and far west, but in subtle forms, it exists throughout the country. Some studies show changing attitudes toward menstruation among younger generations of Nepali youth and a belief that these restrictions should no longer practiced (Acharya 2003, 72).

Sex Education

At the secondary education level, students in Nepal are supposed to learn sex education through a health course. A 2006 study found that sex education was unevenly implemented in the eight schools sampled. Issues contributing to the poor implementation included inadequate teacher preparation, lack of teaching materials, and lack of school and community support (Pokharel, Kulczycki, and Shakya 2006, 159). However, other groups are working to provide sex education outside of school. The Youth Activists Leadership Council, composed of 10 youth activists ages 16–24, advocates at the national and international level for comprehensive sex education and health policies that support reproductive health and family planning services (Youth Activists Leadership Council 2012).

Education

The Ministry of Education and Sports, established in 1951, oversees education in Nepal. Prior to 1951, education was reserved for the royal family and members of upper castes. Nepal has more than 34,000 primary and secondary schools, 9 universities, and more than 1,000 colleges

(World Education News and Reviews 2017). In 2009, Nepal implemented a School Sector Reform Program with two levels, basic education consisting of grades 1–8 and secondary education consisting of grades 9–12. In Nepal, there are both public and private schools. Community and government-run schools are typically used for primary school, whereas private schools are offered at the secondary level. Access to private schools is influenced by class and location, with middle-class families in urban areas being more likely to afford and be located near a higher-quality private school.

Enrollment at all levels of education is increasing, with more than 90 percent of primary school-aged children enrolled in school. At the secondary level, enrollment grew for grades 9–10, from 40 percent in 2004 to 52 percent in

Women's Voices

Kumari: The Living Goddess of Nepal

My name is Sanju Gharti. When people hear me say that I am a woman from Nepal who is pursuing a degree in women, gender, and sexuality studies here in the United States, the first thing that crosses their minds is that women in Nepal must be oppressed and marginalized, because they assume that Nepal is far removed from civilization. They are quick to assume that we are culturally backward in terms of assigning equal status and opportunities to both men and women.

But what they might not know is that we have traditions that uphold women to the status of goddesses. Not only does Nepal have female deities, avatars that are worshipped and revered as statues, images, and symbols, but we also have a real living goddess known as Kumari. Kumari is the tradition of worshipping young, prepubescent girls believed to be manifestations of the divine female energy, or *devi*, in Hindu-Buddhist religious tradition. The word *Kumari* derives from the Sanskrit word *kau-marya*, meaning virgin; hence, Kumari is believed to be the living virgin goddess. As unlikely as it might seem, this strong persona of a female god in an essentially male-dominated orthodox society validates the existence of matriarchal societies in the ancient times within Nepal, and it empowers women today.

2011, and from 6.8 percent to 9.4 percent for grades 11–12 (World Education News and Reviews 2017). A large number of Nepali students who move on to attend college or university travel abroad for their studies; in 2010, there were over 24,000 Nepali students studying abroad (World Education News and Reviews 2017). While enrollment in school is increasing, there are many challenges for girls seeking education, particularly girls from minority ethnicities and in poor and rural communities who are more likely to not attend or to leave school early (Maslak 2003, 11). If a family has to choose which children they send to school, they will typically prioritize the boys' education. The need for girls' labor at home and early marriages are also reasons why girls do not attend school or leave school early.

Health

In Nepal, health care access is varied across location and ethnic, class, and gender markers, with wealthier citizens being able to afford private care or travel to neighboring countries for specialized treatments and poorer citizens not having access to basic or quality care. Since 1991, with the adoption of the National Health Policy, there have been multiple plans to address the lack of access to quality health care in Nepal in the public and private sectors. Health care services are provided at the district level through health posts, subhealth posts, primary health care centers, and district hospitals. There are also regional hospitals and facilities that provide specialized care (WHO Country Office for Nepal 2007, 20). Challenges facing the health care system in Nepal include finances, rural health care facilities lacking resources, clean facilities, and staff and strengthening the health care workforce with better training, resources, and greater numbers as well as improving the availability of health information.

In 2016, the life expectancy for women in Nepal was 71, while the male life expectancy was the age of 70. Infant mortality rates in Nepal have been decreasing since the 1970s, when 250 infants died for every 1,000 live births. In 2016, the infant mortality rate was 30 deaths per every 1,000 live births. Nepal has also worked to decrease the number of children who die before the age of 5. In 2010, 34,000 children out of 730,000 died before the age of 5; this is a decrease from prior years. The common causes of death before the age of 5 are premature birth, acute respiratory infections, birth asphyxia, neonatal sepsis, injuries, and diarrhea (WHO 2015). In Nepal, tobacco use among youth is at 16 percent for girls and 24 percent for

boys. Among adults, 13 percent of women smoke tobacco and 38 percent of men (WHO 2015).

Reproductive and Maternal Health

Women's access to health care, particularly reproductive and maternal health care, is influenced by ethnicity and location. Studies have shown Brahmin, Chhetri, and Newar women are more likely to have access to health care, while women in the lower class and rural locations have less access to care (UNFPA 2007). Addressing maternal health care and decreasing maternal mortality rates have been an area of focus for health organizations working in Nepal. In 1999, Nepal's maternal mortality rate was 901 deaths per 100,000 live births, and that decreased to 258 deaths per 100,000 live births in 2015 (Liu et al. 2016, 58). Factors that affect maternal health include malnutrition and anemia, along with age. Younger women not yet being fully developed can increase complications during delivery. Older women who have multiple or closely spaced births are more likely to have low birth weight babies (UNICEF 2006). In 2007, 50 percent of women in Nepal received antenatal care—health care visits during their pregnancy. Only 36 percent of births were attended by a skilled health professional (WHO 2015). Organizations and health care workers are working to increase the number of rural women who visit health care centers for delivery.

The government of Nepal only allows women employees to take maternity leave twice in their lifetime (ILO 1998). The government has a policy that allows women to take 52 days of maternity leave; however, many employers do not follow the policy. Women working in informal sectors, such as agriculture and domestic service, are paid daily, so women return to work as quickly as possible following childbirth, which can result in problems with prolapsed uteruses, a health issue that is not uncommon for Nepali women in rural communities. As of 2016, the fertility rate for women in Nepal was 2.1, and the use of contraceptives has been steadily increasing. Contraceptive prevalence among women in Nepal was 29 percent in 1996, and in 2007, it was up to 50 percent (WHO 2015). In 2002, Nepal legalized abortion for women in the first 12 weeks of pregnancy and up to 18 weeks of pregnancy in the case of rape or incest.

Diseases and Disorders

In Nepal, the leading cause of death is chronic obstructive pulmonary disease, accounting for 9.2 percent of deaths in

2012. This is followed by ischemic heart disease at 9.2 percent, stroke at 8.2 percent, and lower respiratory infections at 7 percent (WHO 2015). Both outdoor and indoor pollution contribute to the respiratory and heart health-related illnesses and deaths in Nepal. In rural areas, 91 percent of the population uses solid fuels, such as biomass or coal, for cooking, and in urban areas, 29 percent of the population cooks with solid fuels. Due to their roles in the family and community, women and children are at greater risk for diseases caused by air pollution (WHO and UN on Climate Change 2015). Other causes of death in Nepal are diarrheal diseases, accounting for 3.3 percent of deaths in 2012, followed by self-harm and tuberculosis (TB), each causing 3 percent of deaths. Diabetes mellitus caused 2.8 percent of deaths, followed by road injuries at 2.7 percent. The next most common cause of death in 2012 was from preterm birth complications, at 2.5 percent.

In 2015, it was estimated that 39,000 adults over the age of 15 in Nepal live with HIV (UNAIDS 2017). Of those, an estimated 14,000 cases are women and an additional 1,600 cases are children, up to the age of 14. Among women and men ages 15–49, 28 percent say they have experienced discriminatory attitudes toward their HIV-positive status. Health workers are working to prevent mother-to-child transmission of HIV, and per the World Health Organization (WHO), the number of pregnant women receiving antiretroviral therapy (ART) was at 35 percent in 2015 (UNAIDS 2017).

Employment

Women and girls in Nepal participate in both formal and informal labor. While many differences emerge because of location, ethnicity, education, and skills, women's labor can be divided into five broad categories: woman who partly work and hire labor for household work; women who fully work in their households; women who work in their households, agriculture and microenterprises; women who do wage-earning work and household work; and women who work fully outside the home as wage earners (Shrestha 2008, 2). Household work involves caring for children, the production of goods and services for the consumption of the household, as well as agricultural production for the consumption of the household and to sell to others. Most of the Nepali population lives in rural areas, and women are actively involved in farming, household production, and microenterprises. Rural women are involved in the daily collection of water and fuel for kitchen fires, raising

animals, farming, and food preservation activities, and they may participate in forestry collections and other cooperatives, in addition to caring for children (Shrestha 2008, 3). Women in urban areas are more often solely serving their households and raising their children or are employed in formal labor industries, but they also maintain households and perform domestic labor at home.

In waged employment, in industries such as carpet and garment production, women are concentrated in low-paying, less productive, and capital-intensive jobs (Acharya 2003, 45). Women in the agricultural and nonagricultural sectors are paid three-quarters of what men are paid (UNFPA 2007, 19). In a 2008 study of women employed in the organized sector of Kathmandu Valley, researchers found the main motivational drive behind their employment for low-level employees was independence. For the mid- and high-level women employees, who typically had more education or skill training, their motivation was based on career advancement. In both the public and private sectors, women accounted for less than 12 percent of the workforce (Shrestha 2008, 30).

Migrant labor is another source of employment for the Nepalese people. Historically, this has been an option predominantly available for men, but women are increasingly leaving Nepal for work in India and other countries, with some studies suggesting that women are as much as 10 percent of the migrant Nepali workers in India (UN Country Team in Nepal 2011, 70). Many of the migrant workers from Nepal are from lower-caste communities and are often illiterate, leaving them vulnerable to exploitation. This is particularly true for girls and women who are vulnerable to being trafficked and who are often employed in domestic services while abroad, which leaves them vulnerable to abusive and exploitative practices. Migrant labor also affects the families who remain at home in Nepal when workers leave, including the disruption of family relationships and additional burdens for caregiving for the women, children, and elderly who remain. Some women who migrate for work return home to find their husbands living with another woman (UN Country Team in Nepal 2011, 71).

Family Life

Due to Nepal's multiethnic, regionally diverse population and the former caste system, women from different backgrounds and locations have different gender role expectations. Bahun-Chhetris people experience some of

the more severe forms of gender discrimination. Comparatively, Tiebto-Burman women have a higher status, and evidence suggests that some ethnic groups from the hill region have more equitable inheritance traditions (Malla 2011, 97). However, the strong influence of patriarchy and a legacy of Hinduism influence laws and cultural practices that generally have resulted in the societal expectation for girls and women to marry, have children, and take care of the household. Women and girls collect water, prepare food, care for children, and clean, with additional or variant tasks influenced by class and location. Sexuality expectations vary by class, ethnicity, religion, and location. In the 2015 constitution, Nepal recognized the rights of lesbian, gay, bisexual, and transgender people to be free from discrimination and to have state identification that aligns with a person's gender identity, but it does not address same-sex marriage (Panthi 2016).

Marriage

Marriage is an expected component of life in Nepal. In 2001, 94 percent of women and 81 percent of men were married before the age of 30 (UNFPA 2007, 22). Marriage traditions vary among regions, ethnicities, and religions, but it is common practice in Nepal for families to provide *daijo*—a form of dowry that often includes clothing and cooking utensils, and more items depending on the economic status of the family (Galvin 2005, 7). While it is not legal for girls to marry before the age of 18, the median age of women for their first marriage is 16.6 years (UNICEF 2006). Child marriage at early ages is most common in the rural and Tarai regions of the country and among Dalit girls. In Nepal 37 percent of girls marry before the age of 18, and 10 percent marry before the age of 15 (HRW 2016).

For women, along with social pressures for marriage, there is also the understanding that marriage is a means of livelihood. Once married, women typically move to the husband's household, and marriage is the most common reason for women to migrate within the county. While polygamy is illegal in Nepal, there are still polygamous marriages practiced among some hill people and among members of the Dalit caste. Additionally, in some Tibetan communities in the high mountain region, small numbers of women participate in polyandry (UNFPA 2007, 23).

In Nepal, women face barriers in the case of divorce or becoming a widow. Historically for women, the legal

grounds for divorce include a husband taking another wife, if a husband abandons her more than three years, or if the family does not provide the wife with food or clothes. Additionally, divorced women are not granted custody of their children (UN Development Fund for Women 2002, 6). However, now women can file for divorce with common consent with their husbands. Widows face both physical and psychological violence, being viewed in many cultures as a symbol of bad luck or cursed, and the level of discrimination faced by widows is greater than married women (Mānava Adhikārako lāgi Mahilā 2010, 27). While remarriage is allowed, is not a common practice in many Nepali communities. A report in 2000 found that 48 percent of the widow population in Nepal was over the age of 60. In a 2005 study, research found that young widows benefited from moving away from traditional norms by separating themselves from extended family who could be abusive once the husband died, whereas elderly widows benefited from more traditional structures and living with extended family. The study also found that widows are increasingly using different tactics for survival, depending on economic trends, education, and age (Galvin 2005, 148).

Politics

Throughout Nepal's history, women have been involved in different political movements, from the Anglo-Nepalese War (1814–1816) to the Nepal civil war (1996–2006). Women in Nepal were granted suffrage in 1947. The first formal women's organization, the Women's Committee, was formed in 1917 in the Siraha District. Then, in 1947, women actively involved in the movement against the Ranas formed the Nepal Women's Association, and in subsequent years, different women's political organizations emerged (Malla 2011, 47). Women were active participants during the Panchayat period (1960–1990) of Nepali history, and they worked at the local and national levels. The National Assembly used a quota system for women's participation, reserving three seats for women (Malla 2011, 50). Women were also involved in the efforts to end the Panchayat system and institute a democracy in Nepal in the early 1990s.

Women were greatly impacted by, and active participants in, the Maoist insurgency, also known as the Maoist People's War. Women who participated in the People's War were predominantly from poor rural communities and marginalized ethnicities. Throughout the war, women were active in all levels of the insurgency, from being

Women's Voices

Shyam Kumari Sah

Shyam Kumari Sah is an activist from Nepal who focuses on women's rights. Sah helped found Mukti Nepal, an organization that "was established with the aim of ending all kinds of inequalities and violence against women" (Pokhrel 2013). Mukti means liberation, a fitting word for her organization. Sah works on issues of domestic violence, accusations of witchcraft, rape and sexual assault, and dowry. In 2011, the French embassy of Nepal recognized her with a human rights award for her work with Mukti Nepal.

Sah travels to remote villages to educate women on their rights, often putting her safety on the line. In one village, nearly 50 villagers encircled her, ready to kill her, until a human rights defender arrived on the scene and stopped the potential violence. She is committed to women's access to justice, an end to violence against women, and peace.

members of village defender groups to guerilla combatants (Manchanda 2001, 236). Maoists actively recruited women and spoke to issues important to them, such as domestic violence. In the 2008 election that followed the peace agreement, women representatives made up almost 33 percent of representatives in the Constituent Assembly (Malla 2011, 72). In 2015, President Bidhya Devi Bhandari became the first female head of state of Nepal. While women in Nepal have been politically engaged throughout time, barriers remain to having an equitable number of women in government. These barriers include illiteracy, poverty, social barriers, and lack of support from family members.

In 2015, the Parliament passed a new constitution that Nepal currently operates under. The constitution includes broad language about equal rights for women, but legal barriers for women still exist in Nepal, particularly surrounding citizenship, property, and inheritance rights. The constitution states that men can pass their citizenship to their children, but this same right does not extend to women. Women married to foreign nationals cannot pass on their citizenship, and children born to single Nepalese women will only be able to apply for citizenship if the whereabouts of their fathers are known. There is no citizenship provision for children born to single mothers outside of the country (Dulal 2017).

Since the 1990s, laws have attempted to address some of the discriminatory statutes in Nepal; however, challenges still exist. While daughters and sons are equally entitled to inherit property from their parents, girls can only claim their share of the property if they remain unmarried until the age of 35, and if they marry, women must return the property to their natal household. Work is being done to increase women's and girls' access to resources, but legal policies still largely revolve around marriage in determining women's access to and control of property (UNFPA 2007, 60). In the 2001 census, 11 percent of households in Nepal had female landownership, 5.5 percent of households were in a woman's name, and only 7.2 percent of women owned livestock (Acharya 2003, 47). Women and feminist organizers in Nepal have worked to increase women's and girls' status in society and to address issues such as unequal laws and social practices as well as such issues as sexual and domestic violence.

Religious and Cultural Roles

Hinduism is the predominant religion in Nepal, followed by Buddhism; the country has deep connections for both faiths. The Himalayas are considered sacred in the Hindu faith, and Nepal is the birthplace of the Buddha. Women keep devoted religious practice in Nepal. The two largest

festivals in Nepal are Dashain, a 15-day national celebration, and Tihar, a 5-day celebration known as the “festival of lights.” Each day of the festivals carries specific meaning and worshipping rituals (UN Development Fund for Women 2002, 51). The ethnic and religious diversity in Nepal results in varied cultural practices for women. Some cultural practices, such as *chhaupadi*, the belief based in Hinduism that women are unclean during menstruation and after the delivery of a child, still have negative impacts on women in Nepal today.

Issues

Community Forestry

Nepal has a vast amount of forest resources and a broad range of biodiversity. Since 1978, community forestry has been an important development project in Nepal. Community forests are part of the national forests given to community user groups for development and use based on a work plan. User groups set the price of forest products for sale and distribution among the members for the group’s collective benefit. The objectives of community forestry are to support sustainability, improve forest conditions, and supplement local needs (Agarwal 2010, 88). The benefits of community forestry include the protection and maintenance of forests by community members, a participatory democratic form of management, and increasing self-reliance for communities through income-generating activities. In Nepal, the community forests are managed by an executive committee consisting of 9–15 members elected by the general body. Women play a significant role in community forestry in many ways. They contribute their indigenous knowledge of forest resources in community forestry group meetings and are active workers in promoting wood-saving stoves. Women participate in the daily management of forests and soil conservation efforts and skills trainings. As of 2008, there were 560 all-women forest user groups in Nepal (Shrestha 2008, 39).

Violence against Women

Violence against women in Nepal manifests at the family, community, and state levels and takes many forms, including domestic violence, sexual assault, sexual harassment, and trafficking. At the state level, violence manifests in the policies or lack of policies toward women. At the family and community levels, women and girls experience violence and harassment from family members and in the

workplace, with some populations of girls and women being particularly vulnerable to trafficking.

Sexual Harassment

Sexual harassment is prominent in Nepali workplaces. A study of workplaces, including the carpet and garment industry, hotels, airlines, hospitals, restaurants, and government offices, found that 48 percent of women employees experience sexual harassment (Shrestha et al. 2010, 6). Women working as low- and mid-level employees are among the most prone to harassment. Barriers to addressing sexual harassment include a lack of awareness that sexual harassment is an issue worth addressing and few repercussions for harassers because women who face sexual harassment are often from lower classes. However, women from all classes experience harassment, including women politicians.

Domestic Violence

Domestic violence in Nepal happens in all communities. Domestic violence includes physical abuse, sexual abuse, psychological and emotional abuse, and economic abuse. The patriarchal structure and cultural, religious, and social norms in Nepal contribute to household violence against women and girls. Perpetrators of domestic violence are usually the women’s husband or male partner, her in-laws, or other family members. The type of violence experienced can include beatings and verbal abuse, including while women and girls are pregnant. Reported causes of violence vary from arguments over money, perceived failure to properly perform household tasks, or disrespect (UNFPA 2007, 32). Women remain in violent household for various reasons, including an inability to support themselves and their children, fear of losing respect in family and community, threats from the perpetrators, hope of change, and for their children.

Sexual Violence

A 2014 study of the national prevalence of intimate partner violence against women in Nepal found that almost 15 percent of women ages 15–49 experienced sexual violence. During the People’s War, sexual violence was used by both the Maoists as well by the state security forces through coerced sex work around army barracks (Rajbhandari 2006, 17). Young girls experience sexual violence through child marriage as well as trafficking. Children and young women are the most vulnerable to sexual exploitation and abuse in Nepal. In 2006, the Ministry of Women, Children,

and Social Welfare estimated that 40,000 women aged 12–30 were working in cabin and dance restaurants and massage parlors in the Kathmandu Valley and are forced to engage in sexual activities. A 2001 study found that every year 12,000 children are trafficked outside of the country, and of those children, more than 50 percent were under the age of 16; 25 percent were under the age of 14 (UN Country Team in Nepal 2011, 35). A 2005 study found that there were 25,000 Nepali sex workers in India (UNFPA 2007, 31).

New Zealand

Overview of Country

Aotearoa New Zealand is located in the southwestern Pacific Ocean. It consists of three main islands: the North Island, the South Island, and Stewart Island. New Zealand is approximately 600 miles south of the Pacific islands of Fiji and Tonga and 900 miles east of Australia. The country is roughly 103,483 square miles. On December 1, 2014, the population of New Zealand was estimated at about 4.5 million (Statistics New Zealand 2014). About one-third of the population is aged 15–39 years old. The official languages are Māori, English, and New Zealand Sign Language. Europeans are the largest group in New Zealand, with approximately 74 percent of the population identifying as such. Māori comprise 15 percent, and Pasifika comprise 12 percent of the population. A majority of the people live on the North Island, with Auckland housing 1.4 million people. New Zealand is a popular place for travel; 2.64 million individuals visited the country in 2013. Those tourists mostly came from Australia, the People's Republic of China, the United States, and the United Kingdom.

The issues women and girls in New Zealand face are similar to other Western countries: pay inequity, domestic violence, rape culture, and reproductive justice. In 2014, the UN Development Programme (UNDP) ranked New Zealand 7th out of 187 nations based on the Gender inequality index (0.185).

Māori are the indigenous population of New Zealand. Their ancestors discovered the islands around 1,300 CE, naming the new land Aotearoa (the "land of the long white cloud"). Dutch explorer Abel Tasman came to New Zealand in 1642, but it was not until English explorer James Cook arrived in 1769 that the country became a priority for British colonization. Representatives of the Crown negotiated with Māori chiefs and signed Te Tiriti o Waitangi on February 6, 1840, making New Zealand a colony of Great Britain.

Girls and Teens

Girls in New Zealand attend school, engage with their friends, and play important roles in their families. Many begin babysitting at the legal age of 14. They may play sports, and they enjoy being creative and excel in academics. Girls in New Zealand are a diverse group, coming from different ethnic, religious, and class backgrounds. In 2013, the most popular girl names in New Zealand were Charlotte, Emily, and Ruby (Department of Internal Affairs 2015). Well-known young women from New Zealand include professional golfer Lydia Ko, Man Brooker Prize-winning author Eleanor Catton, and the musician Lorde.

Recreation

Many young girls and teens of all ethnic backgrounds participate in kapa haka. Kapa haka is a Māori performance containing chanting, singing, and movement. Performers wear traditional clothing and adopt specific facial expressions (such as wide eyes and jutted chins) throughout the

Lorde

Lorde is best known for her 2013 hit song "Royals." Born in Takapuna in 1996, Lorde grew up singing in Auckland. She writes much of her music, and many of her songs criticize popular and consumer culture. Lorde identifies herself as a sex-positive feminist and has participated in political activism by filming a video that encouraged young people to vote in a New Zealand election. She has been recognized by both *Time* and *Forbes* as one of the world's most influential youth.

—Cat Pausé

performance. Many schools offer opportunities for girls to participate in kapa haka. Most kapa haka consist of several songs (including warm-up, action, challenge, and closing) and rely solely on vocal intonations.

GirlGuiding Nga Kohine Wakamahiri o Aotearoa was founded in 1908 to provide opportunities for girls and young women to develop confidence, self-esteem, and skills. Its mission is to “enable girls and young women to reach their potential and make a difference in the world” (GirlGuiding 2016). GirlGuiding is part of the World Association of Girl Guides and Girl Scouts. More than 12,000 girls participate in GirlGuiding, including selling their Guide Biscuits each year to raise money for the organization.

Sports

Sports are an important part of New Zealand culture. Popular sports include rugby, rowing, and cricket. Young girls believe sport to be a fun activity to engage in; it allows for interacting with friends and developing personal skills, both physical and social (Burrows and McCormack 2011). Netball is the most popular sport girls play. It is played with teams of seven who work to score goals by passing a ball down a court and shooting it through a goal ring at the end. Netball has a very high profile in the country; the women’s professional team, the Silver Ferns, is at the forefront of the sport internationally. The Black Ferns, the women’s professional rugby team, won the Rugby World Cup three times in the early 2000s.

Education

Primary Education

Early childhood education is strongly valued in New Zealand, with providers being either teacher led, like kindergartens, or parent led, like play centers and *kohanga reo* (centers that operate in the indigenous language). Most children begin formal schooling on their 5th birthday. In New Zealand, education is compulsory from ages 6–16. Schools in New Zealand conform on their school terms, with four terms splitting up the year. A six-week holiday break is taken during the summer Christmas season, and three two-week breaks are scheduled throughout the year. Schools teach the New Zealand Curriculum, which consists of eight learning areas: English, science, social sciences, arts, languages, technology, statistics, and health and physical education.

Sex Education

Sex hygiene was included in the curriculum in New Zealand from the advent of formal schooling. It focused on preparation for marriage and stressed the importance of sexual purity beforehand. Current sex education in New Zealand is a required subject in primary school. But each school may determine how to teach the material, and parents may opt their children out of participating. Sex education often takes a holistic approach to sexuality, considering physical aspects as well as psychosocial and social aspects (Allen and Elliot 2008). Following an increase in discussions around rape culture, calls have been made to have greater attention focus on the importance of active consent (Davison 2014).

Secondary Education

From year 11 (approximately 15 years of age), students choose the subjects they wish to study to achieve their National Certificates of Educational Achievement (NCEA). Young women are more likely than young men to select the subjects of English, biology, and classical studies (Statistics New Zealand 2005). NCEA is the primary secondary school qualification and may be achieved at three levels (level 1 in year 11, level 2 in year 12, and level 3 in year 13). Ninety-five percent of young women complete some secondary education in New Zealand, with many leaving after year 12 (United Nations 2014). Young Māori women are the least likely to leave secondary school without a NCEA qualification (Focusing on women 2005).

Tertiary Education

In New Zealand, tertiary education is provided by universities, polytechnics, Wānangas, and private training establishments. Universities focus on advanced learning, while polytechnics focus on vocational and professional programs. Wānangas also focus on advanced learning, with a special emphasis on indigenous knowledge (*kaupapa*) and ways of being and acting (*tikanga*). Most bachelor’s degrees take three years to complete, although many students complete a fourth honors year.

Health

Life expectancy for white women in New Zealand is 83 years old (OECD Better Life Index 2015). Of those living in New Zealand, 85 percent report more positive experiences

Sandra Grey

Sandra Grey is the national president of the Tertiary Education Union (TEU). The TEU provides support for more than 10,000 workers in the postsecondary sector in New Zealand. As an academic whose work focuses on social movements and politics, Dr. Grey has studied women's political representations and the role of women in community and voluntary groups. In 2013, the TEU produced *Te Kaupapa Whaioranga*, its policy document outlining a vision for tertiary education in New Zealand (see *Te Kaupapa Whaioranga*). This document pays special attention to the needs of Māori, Pasifika, and of women in the sector in particular. Dr. Grey previously served as the National Women's vice president of TEU and the spokesperson for the campaign for the mixed-member proportional representation voting system.

—Cat Pausé

daily than negative experiences, compared to the Organisation for Economic Co-Operation and Development (OECD) average of 76 percent. According to the New Zealand General Social Survey (2013), 60 percent of New Zealanders described their current health status as good or excellent, 52 percent stated they earned a living wage, and more than 90 percent identified a sense of belonging to New Zealand.

Health Care Access

Health care in New Zealand is provided by both the public and private sectors. Since 1935, all New Zealand residents and citizens have been provided affordable access to the publicly funded system. Visiting a general practitioner costs a small fee, which is often reduced based on need, and specialist and hospital care are provided free of charge. Medications are also subsidized, resulting in little cost to the individual. The Accident Compensation Corporation (ACC) covers the treatment for accidents within the country for all individuals, including tourists. District health boards manage the public health system across the country. Some individuals choose to purchase private health insurance to guarantee quality service quickly. New Zealand spends less than 10 percent of its gross domestic product (GDP) on health care, with excellent health

outcomes for most citizens (Ministry of Health 2016b). Barriers to accessing health care include social class, ethnicity, and body size (with overweight women less likely to access health care than leaner women, due to stigma).

Child Health

All aspects of health care are free to children from birth to 5 years of age, but children living in poverty (one in five) have poorer health care access and outcomes than those out of poverty. These include health checks and programs designed to support new parents. Children aged 5–18 have most of their health needs covered by the public system, including immunizations, eye and hearing checks, and general practitioner visits. The most common health concern in children in New Zealand is asthma, especially among Māori and Pasifika youth. And an increase in diagnosed behavioral problems, such as ADHD/ADD, has health officials concerned (Ministry of Health 2012).

Diseases

The Ministry of Health establishes health targets for New Zealand to improve health care performance and ensure that appropriate funding priorities are set. Current health targets include increasing immunizations, reducing smoking, and improving cancer treatments. The health issues most common for women include cancer, heart disease, and respiratory diseases. Breast cancer is the most common cancer diagnosed in women in New Zealand. Unfortunately, Māori women are more likely to have a delayed diagnosis of breast cancer due to delayed access of care; therefore, they are also more likely to die from it. Māori women experience many barriers to health care, including discrimination, access, and cost (Ellison-Loschmann and Pearce 2005).

Te Ropu Wahine Māori Toko i te Ora

Te Ropu Wahine Māori Toko i te Ora (Māori Women's Welfare League) was established by the government in the 1950s to improve the health and well-being of Māori women in New Zealand. In its early days, the focus was on immunization, family planning, and tuberculosis (TB). As the league grew through the latter part of the 20th century, there were other issues, such as family violence and sexually transmitted infections. The Māori Women's Welfare League was central in the establishment of Te Waka Hauora (the National Māori Health Authority).

The Cartwright Inquiry

The Cartwright Inquiry was held in the late 1980s to investigate unethical practices in the treatment of women with abnormal cervical smears at the National Women's Hospital. The attending physician under review was found to have withheld treatment from women with abnormal smears. The inquiry's results changed the laws around health consumers' rights in New Zealand and enshrined informed consent within all research practices. It resulted in New Zealand being the first country to guarantee patients' rights by law, and it helped promote patient-centered health care around the world.

—Cat Pause

Childbirth and Maternal Health Care

Maternal health is robust in New Zealand; the maternal mortality rate is 15 deaths in every 100,000 live births (Ministry of Health 2016a). Pregnant women in New Zealand select a lead maternity carer (LMC) to oversee their pregnancy. This may be a general practitioner, a midwife, or an obstetrician. Most women chose a midwife to be their LMC. Women may select to give birth at home or in a hospital. Home birth is regarded as a viable and even preferable birthing option for many women in New Zealand; approximately 3–5 percent of all births take place within the home.

Reproductive Justice

The Contraception Sterilisation and Abortion Act of 1977 allows for women to have access to an abortion for fear of physical or mental harm (saving the life of the women, preserving the physical health of the women, preserving the mental health of the women, fetal impairment, and in cases of incest). Two doctors must sign off on the need for an abortion. There are no parental notification restrictions on access for young women (Abortion Services in New Zealand. 2016). The Abortion Law Reform Association of New Zealand continues to work toward the complete decriminalization of abortion within the country.

Employment

Most women in New Zealand engage in paid employment. Almost half of the women who work in New Zealand

are in female-dominated occupations. Women are more likely than men to work part-time and to be in temporary positions. White women earn 85 percent of men's average hourly pay (CEVEP 2016) with an average gross income of USD\$19.125 (United Nations 2014); women of color earn even less.

Typical Jobs and Careers

Women may be found in a wide variety of careers in New Zealand. Professional, community, and personal service workers are overwhelmingly women. Female-dominated occupations also include nurses, teachers, and midwives. Half of the young doctors in the country are women, although they are poorly represented in the specialties of surgeon and anesthesiologists (Callister and Didham 2013).

Labor Regulations

The Employment Relations Act outlines the minimum employment rights guaranteed to all individuals working in New Zealand. These include a 37.5-hour full-time work week, 4 weeks of paid holiday per year, 14 weeks parental leave, and bereavement leave. The current minimum wage is USD\$10.48 an hour (see Ministry of Business, Innovation & Employment). Since March 6, 2015, the Employment Relations Amendment Act has been enacted. This removes several protections that workers currently have in New Zealand, including collective agreement coverage for the first 30 days of employment and tea and lunch break entitlements. This amendment will also allow employers to opt out of multiemployer collective agreements and to deduct partial pay from workers' pay for partial strikes.

Pay Equity

The Equal Pay Act of 1972 made it illegal for women to earn less than men for doing work that requires the same, or similar, skill, responsibility, and working conditions in both the public and the private sectors (equal pay was protected for the public sector in the 1960 Government Service Equal Pay Act). Unfortunately, pay equity has not been achieved in New Zealand, with the hourly gender wage gap sitting around 9.9 percent (Ministry of Women 2014). According to a recent document from the Ministry of Education, within five years of graduation from tertiary education, men earn more than women at all qualification levels (Ministry of Education 2014).

Before 2009, a Pay and Employment Equity Unit worked within the Department of Labour to provide support for employers to conduct pay and employment equity reviews. These reviews were often partnerships between employers and unions. The PaEE Unit developed the Equitable Job Evaluation System and the New Zealand Gender-Inclusive Job Evaluation Standard. This unit was dissolved, and its work ceased when the conservative government took office in 2009.

Many sectors in New Zealand have undergone job sizing: assessing the skills, knowledge, responsibility, demands, and effort in positions. This allows comparisons to be made across sectors, such as the similar job sizing between police officers and nurses. A recent court case has explored this further, with a residential aged-care provider, Kristine Bartlette, arguing that the pay in her sector is low because care work is seen as women's work. The employment court agreed with her, and the appeals court dismissed an appeal brought by her employer. The employer may now decide to appeal this to the Supreme Court. Bartlett's wins in employment and appeals courts are victories for pay equity in New Zealand.

Sexual Harassment

The Human Rights Act 1993 protects individuals from sexual harassment in the workplace (along with educational settings, and access to goods, public places, accommodation, etc.). Sexual harassment claims may also be filed under the Employment Relations Act 2000. Sexual harassment is divided into two types of possible complaints: complaints about requests for sexual activity for preferential treatment or the avoidance of detrimental treatment and complaints about behaviors of a sexual nature that are unwelcome or offensive. Behaviors of a sexual nature that may be considered harassment include sexual jokes, offensive body gestures, provocative posters, and repeated comments about a person's sex life or sexual activities. Sexual harassment has been on the front page of New Zealand news, as the chief executive of the Canterbury Earthquake Recovery Authority resigned his position after being found to have engaged in serious misconduct during a sexual harassment investigation (Edwards 2014).

Sex Work

Sex work is legal in New Zealand. The Prostitution Reform Act of 2003 decriminalized brothels, escort agencies, and soliciting; it is suggested that the laws around sex work

New Zealand Prostitutes Collective

From 1987, the New Zealand Prostitutes Collective (NZPC) has been supporting the rights of sex workers in New Zealand. NZPC works to have sex work acknowledged as work, and sex workers acknowledged as workers who deserve the same protections and conditions as those in other sectors. Operating free sexual health clinics in the major cities in New Zealand allows the organization to provide bias-free, anonymous, sexual health care to its members. NZPC liaises with government agencies on issues relating to sex work, educates sex workers on important topics, and works to ensure occupational health and safety for sex workers. NZPC also organizes conferences and facilitates research into sex work.

—Cat Pausé

in New Zealand are among the most liberal in the world. Before the Reform Act, sex work was allowed to operate indoors under disguise (see, e.g., the Massage Parlours Act of 1978). Legalization has allowed for sex work to be legislated, monitored, and regulated, like other industry sectors in the country. It has also allowed sex workers to unionize, capitalizing on the power of collective bargaining and employment negotiations (see the New Zealand Prostitutes Collective).

Maternity Leave

Paid parental leave in New Zealand is among the lowest in the OECD. Parental leave is available to women having a baby or parents who adopt. In an employed married couple, the mother is entitled to 10 days of special leave before the birth for necessary appointments, 14 weeks of paid parental leave, and an additional 52 weeks of unpaid leave. The mother is able to transfer the 14 weeks of paid parental leave to the other parent; the other parent may also split the 52 weeks of unpaid leave. These conditions are the minimum provisions guaranteed by law. An individual's employment agreement may extend these entitlements beyond what is required by law (Ministry of Business, Innovation & Employment 2015). In a parliamentary session in 2012, Sue Moroney, a Labour member of parliament (MP), presented a bill to expand paid parental leave to 26 weeks. The bill had the support of the New Zealand

26 Weeks for Babies

In 2012, Labour Party MP Sue Moroney introduced a bill to Parliament that would extend paid parental leave in New Zealand from 14 weeks to 26 weeks. Extending paid parental leave to 26 weeks was argued to support families, recommendations from the World Health Organization (WHO) on the importance of exclusive breastfeeding, and the economy (by providing employment opportunities for those replacing staff on parental leave). The bill passed its first vote a few months later with support from Labour, NZ First, Maori Party, Mana Party, United Future, and the Greens. The national government threatened to veto the bill, claiming costs were too high. In its 2014 budget, the government increased paid parental leave to 16 weeks on April 1, 2015, and then 18 weeks on April 1, 2016.

—Cat Pausé

populous (see the 26 weeks for babies campaign), but it failed to get the support of the government. The government did agree to increase parental leave to 16 weeks from 2015 and 18 weeks in 2016; the amount of the parental tax credit was also increased.

Family Life

Family life is important, especially for the Māori. Families are the main organizing structure in society. It is projected that couples without children will be the largest-growing family type in the 2020s. This is partly because of the aging baby-boomer generation, whose children no longer live at home. The number of single-parent families is also expected to increase (Statistics New Zealand 2010a). For the Māori, *whanau* (family) is multigenerational, and there is little distinction between the nuclear family and extended family. Whanau provides structure, history, and support for its members. Within the *whanau*, particular importance is placed on the *tamariki* (children) and *koroua* (elders).

Marriage

Marriage is important to people in New Zealand, and most young women marry during early adulthood. The median

age of marriage is 30 (Statistics New Zealand 2013). Many young people work to have equal-partner relationships in their marriages, where both individuals share responsibilities inside and outside the home. This balance is often upset with the introduction of children, as women take on significantly more responsibilities within the home, even when continuing to work full-time outside the home. The Civil Unions Act of 2005 allowed for the legal recognition of same-sex couples in a union but not a marriage. That changed in 2013, when the Marriage Amendment Bill made New Zealand the first country in Asia-Pacific (and the 13th country in the world) to recognize same-sex marriages. The first same-sex marriage took place on August 19, 2013.

Fertility

The median age of women having their first baby in New Zealand is 30. As is true in most Western cultures, women are having fewer babies in New Zealand as compared to several decades ago. The crude birth rate in New Zealand is 15.1 live births per 1,000 people. The total fertility rate in New Zealand is 2.2 births per woman. The median age of a woman giving birth in New Zealand is 29.8. Access to quality health care in New Zealand means that the maternal and infant mortality rates are both low (15 deaths/100,000 live births, and 4.59/1,000 live births, respectively) (Statistics New Zealand 2009).

Migrants

Many individuals migrate to New Zealand each year from countries around the world. India, China, Germany, the United Kingdom, and the Philippines are the countries of origin for most migrants. There are many types of entry for migrants, including the skilled migrant category (for workers with skills, qualifications, or experience that New Zealand has identified as “high need”). Migrants applying for this category must be under 55 years of age and pass health tests and character and English-language requirements (New Zealand Now 2016). More adult women migrate into New Zealand now than adult men, especially of Asian ethnicity (in direct contrast to 19th-century patterns of young men migrating to New Zealand), following the international trend for women to migrate independently or for work purposes. Groups such as the Women’s International Newcomers Group Social provide support for newly immigrated women.

Shakti

Shakti is a nonprofit organization that provides support for migrant and refugee women from Asia, Africa, and the Middle East. Shakti's services include family violence support, prevention, and awareness. Shakti has member organizations across New Zealand. It was founded in 1995 by Farida Sultana, who wanted to create a safe space for Asian women who were experiencing family violence. Her original group expanded later to the national nonprofit that operates today across seven locations. Many locations provide programs that assist women in empowerment, building life skills, and education. Shakti also assists migrant and refugee women in accessing available government support.

—Cat Pausé

Refugees

New Zealand accepts refugees for many reasons, including women at risk in their home country. Refugee women may struggle to settle within New Zealand for many reasons, including ongoing trauma, lack of familial support, and nonrecognition of tertiary qualifications (New Zealand Red Cross 2016). There are many organizations within New Zealand that provide support for refugee women, including the Women's Network of ChangeMakers Refugee Forum. Depending on culture, refugee women may also struggle with oppression stemming from honor-based violence, forced marriage, underage marriage, and dowry abuse (De Souza 2013).

Politics

New Zealand was the first country where women won the right to vote. Since that culture shift, New Zealand has had women as prime minister, governor-general, head of state, and chief justice. While women remain underrepresented in politics at both the local and national levels, the introduction of the mixed-member proportional representation voting system has seen an increase in women MPs.

Government Structure and Participation

The government of New Zealand is an elected House of Representatives (composed of MPs). The government

advises the head of state, Queen Elizabeth II. The queen has a representative in New Zealand called the governor-general. Except in rare circumstances, the queen acts on the advice of the government. This form of government is called a constitutional monarchy.

There are three branches of government in New Zealand: Parliament, the executive, and the judiciary. Parliament makes the laws, which are enacted by the executive and may be interpreted by the judiciary. There is no written constitution in New Zealand. There are 120 MPs that are elected for terms of three years. MPs are elected under a mixed-member proportional representation (MMP) voting system. Each individual has two votes, a party vote and a vote for a local member to represent their area in Parliament. The parties in Parliament are represented in proportion to the share of party votes they achieve. MMP has seen an increase in women's representation in Parliament as well as an increase in representation for the Māori (Grey 2006).

Suffrage

In 1893, New Zealand became the first country where women won the right to vote (New Zealand History 2015). Suffragettes who campaigned for this right included Kate Sheppard (who is on the \$10 note), and Meri Te Tai Mangakāhia; the camellia flower became synonymous with the movement. On September 19 of every year, women across New Zealand celebrate suffrage with breakfasts, rallies, and by wearing camellias on their clothing. Even with the right to vote, women were excluded from running for Parliament until 1919, and the first woman MP was not elected until 1933 (New Zealand History 2015). After the introduction of the mixed-member proportional system, women often held 30 percent of parliamentary seats. In 1997, Jenny Shipley became the first female prime minister. From March 2005 to August 2006, New Zealand was the only country in the world where the highest constitutional officials were all women: prime minister, head of state, governor-general, Speaker, and chief justice (Collins 2005).

LGBT Rights

In 1986, the Homosexual Law Reform Act was passed, decriminalizing same-sex relationships between men in New Zealand (same-sex relationships between women were never illegal). The public support of the act was varied; members of the LGBTIAQ community faced the same kinds of bias, oppression, and hatred as others in their

Georgina Beyer

Georgina Beyer was born in 1957 and became the world's first openly transgender member of parliament (MP) in 1999. Before becoming an MP, Beyer was the world's first openly transgender mayor. In a member bill in 2004, Beyer proposed to add *gender identity* to the Human Rights Act, prohibiting discrimination against individuals based on their gender identity. The bill was withdrawn after the solicitor-general clarified that gender identity was already protected under the Human Rights Act. She served as a list MP for Labour from 2005 to 2007 before retiring from politics and working in the public sector on issues related to gender equity and domestic violence. She returned in 2014, for an unsuccessful run for a seat as a member of the Mana Party. A film about her life, *Georgie Girl*, has screened at more than 30 international film festivals.

—Cat Pauseé

community living elsewhere in the Western world. A few years later, the Human Rights Act made it illegal to discriminate on the grounds of sexual orientation. In 1993, Labour MP Te Atatu Chris Carter was New Zealand's first openly gay member of Parliament. The 1996 census recognized same-sex couples. Labour MP Georgina Beyer was New Zealand's first openly transsexual member of Parliament in 1999 (New Zealand History 2015).

Feminist Movements

Suffrage, while an important part of feminist history in New Zealand, was not the only activist movement within New Zealand. Female-dominated unions, such as the Dunedin Tailoresses' Union, the Christchurch Tailoresses' Union, and the Auckland Tailoresses' Union, worked to improve conditions for women working in factories in the late 19th and early 20th centuries. Other women-dominated occupations—teaching and nursing—unionized as well to collectively organize. The Family Planning Association worked to ensure reproductive justice and health for all women. The Society for the Protection of Women and Children works to improve domestic conditions for women and children. And the Women's Studies Association works to improve gender equity within education and

to promote the availability of women's and gender studies courses within tertiary education.

Wellington Young Feminists' Collective

The Wellington Young Feminists' Collective is a social group of feminists in the capital city of Wellington. The group has three primary functions: social, education, and activism. The group is open to anyone who identifies as a feminist, including men and trans individuals. Despite the name, feminists of all ages are welcome to participate in the group (Wellington Young Feminists' Collective 2016).

National Council of Women

The National Council of Women was formed in 1896 with the aim to “unite all organised Societies of Women for mutual counsel and co-operation, and in the attainment of justice and freedom for women, and for all that makes for the good of humanity” (New Zealand History 2015). In its early days, the National Council of Women worked for legal equality for women and men in employment settings, stricter enforcement of liquor laws, universal pensions for those in old age, and prison reform. It continues to work on issues such as barriers for women in the workplace and pay equity.

Cultural Roles

Women play important roles throughout New Zealand culture. They are active in the arts and utilize new social media to engage with each other and the larger world. Women are especially engaged in activism in New Zealand, from the 1980s anti-apartheid protests to more modern movements promoting fat rights. Community groups provide ways for women to network, build skills, and share interests. Most community groups are organized around religious affiliations, family life, service, and identity.

In the Arts

New Zealand women have long been involved in the arts. *Spiral*, a journal of women's arts, began publishing in the 1970s, and there are women's galleries and art festivals across the country. Women found that organizing allowed for support and collective-bargaining opportunities. The Women's Professional Playwrights Association (WOPPA) was established in the early 1990s to support women playwrights, and the Equity Women's Caucus supports women

Broadsheet

From 1972 to 1997, a feminist magazine called *Broadsheet* was produced monthly in New Zealand. Founded by Anne Else and Sandra Coney, it was New Zealand's first feminist magazine. Consisting of 12 foolscap pages (8.5 × 13.5 inches), *Broadsheet* covered a range of issues, including politics, sexuality, health, and art. The magazine often focused on Māori issues, which resulted in heated conversations as subscribers responded through submitting letters to the magazine. Subscribing to the magazine itself was often seen as controversial, which one library in Nelson, on the South Island, discovered when male city councillors objected based on the magazine's content. When *Broadsheet* ended publishing in 1997, it had been the longest-running second-wave feminism magazine in the world.

—Cat Pausé

actors. Mediawomen provides support for women writers, producers, and directors. Some forms of media stand out for their inclusion of women. TV3's nightly news show *Nightline*, for example, was hosted by a woman for its 15-year run. And the popular TV show *Outrageous Fortune* allowed Cheryl West's matriarch into New Zealand homes each week.

Feminist Bloggers

New Zealand has a wide range of feminists who are active with blogs. *The Hand Mirror*, for example, is a popular New Zealand feminist blog. Dating back to 2008, the blog has posted more than 2,500 pieces. The blog itself seeks to promote female bloggers in New Zealand, and most posts deal directly with gender oppression within the country (*The Hand Mirror* 2016). Many writers for *The Hand Mirror* maintain their own feminist blogs as well, such as *A Bee of a Certain Age* and *Kiwi Stargazer*. Other popular feminist blogs include *He Hōaka* and *Not Afraid of Ruins*.

Māori Activism

Māori women have long been active in social justice and shaping New Zealand culture; 13 of them signed the Te Tiriti o Waitangi. Māori women, such as Dame Whina Cooper, were central to the establishment of the Waitangi Tribunal,

Waitangi Tribunal

The Waitangi Tribunal was established in 1975 to investigate failures of the British Crown to fulfill the promises made in Te Tiriti o Waitangi to the indigenous peoples of Aotearoa New Zealand. Various claims have been made to the tribunal, including claims relating to traditional fishing rights, Māori language (*Te Reo*), geothermal rights, and land rights. The tribunal itself does not have the power to change laws or negotiate claims, but it does make recommendations to the government on how to proceed in addressing breaches of Te Tiriti. For example, the tribunal made a recommendation that *te reo* be established as an official language of New Zealand. This recommendation was enacted in 1987.

—Cat Pausé

a commission of inquiry charged with investigating failed promises by the Crown to the indigenous peoples of New Zealand (Mikaere 1994). Important issues for Māori activists include education, domestic violence, prison reform, and the health and well-being of the Māori people. For example, Māori women worked to establish *kohanga reo* across the country. These early education settings focused on providing instruction in *tikanga* and the native language. One of New Zealand's most notable organizations of social justice is the Te Rōpu Wahine Māori Toko i te Ora (Māori Women's Welfare League).

Fat Activism

New Zealand and Australia have both seen a rise in fat activism. In Australia, groups such as Aquaporko (a fat-synchronized swimming group) and Va Va Boom-bah (a fat burlesque troupe) are challenging cultural ideas around obesity. Within New Zealand, fatshion blogger Meagan Kerr has recently received media attention for her work promoting fashion tips and style advice for overweight women (O'Neill 2014). *Friend of Marilyn*, a fat-positive radio show, celebrated its 100th episode in 2014, making it the longest-running fat-positive radio show (Kirk 2011). Fat activists in New Zealand work to ensure that fat people have the same rights and dignity as nonfat people. The Human Rights Commission does not currently include size as a protected category within New Zealand.

Religious and Cultural Roles

Sixty percent of the New Zealand population declares a religious affiliation, with a little more than half of those affiliated with Christianity. Of those with an affiliation, approximately 15 percent regularly attend services. Missionaries who arrived during colonization worked to convert the indigenous population, with Catholicism becoming one of the most common among the converted due to their establishment of schools. Catholicism is the most common affiliation today, with about 11 percent of the population identifying as Catholic (Statistics New Zealand 2014). Syncretic faiths, such as Pai Marire, Ringatu, and Ratana, arose as Māori developed new belief systems that integrated traditional beliefs with common tenets of Christianity. Immigration from Asia and the Middle East has seen the rise of the Eastern religions of Hindu, Islam,

and Buddhism. Many religious buildings have become icons in New Zealand, such as the Holy Trinity Cathedral in Auckland, the Futuna Chapel in Wellington, and the Christchurch Cathedral in Christchurch (which was destroyed in the 2011 earthquakes). As with most Western cultures, religion plays a somewhat small role in politics. In 2016, the prime minister, John Key, and the former prime minister, Helen Clark, are both agnostic. Women's roles in their religious communities vary among the denominations.

Community Groups

For women in New Zealand before the mid-20th century, most of their lives were spent within the home. Women fostered relationships with one another and their community through normed social outings, such as church and inviting others over for morning or afternoon tea. In the early 20th century, organizations such as the Women's Division of the Farmers' Union provided communal opportunities for women in isolated rural areas. Community groups today often center on self-improvement, service, identity, and the family. The largest women's community group in New Zealand is the New Zealand Federation of Women's Institutes. Groups such as Plunket and the Salvation Army Home League provided women opportunities for fellowship and skill building. Other groups, such as Zonta and Business and Professional Women New Zealand, provide opportunities for professional networking and leadership roles. Most community groups have an aging membership and are struggling to recruit young members.

Women's Voices

Helen Clark

In 1999, Helen Clark became the first woman to be elected prime minister of New Zealand. She served three terms (of three years each), and she is now head of the UN Development Programme (UNDP). There are talks of her leading the United Nations when the current leader steps down. If she does, she will be the first woman in that position.

Clark's tenure in the UNDP has led the organization to respond to the Syrian refugee crisis, help South Sudan's efforts toward reconciliation, and help Sierra Leone's Ebola crisis. When asked about her legacy, Clark responded, "I don't necessarily want to be remembered as the most popular girl on the block. I want to be remembered as the girl who made a difference" (McKenzie 2013).

Plunket

The Royal New Zealand Plunket Society has been providing health and education services to young children in New Zealand since 1907. Plunket is a commonly accessed service, providing home or clinic visits for children under five and their families. These visits include developmental assessments and an opportunity for the parents to express concerns about issues such as breastfeeding, sleep, nutrition, and the like. Plunket also provides car seats, toy libraries, parent groups, play groups, and early childhood education (Plunket).

Zonta

The New Zealand District of Zonta provides professional women with leadership and networking opportunities.

Similar to Rotary clubs or the Lions Club, Zonta is a service organization that works to advance the status of women around the world. Zonta provides scholarships, promotes projects, and gives awards for improving the economic, educational, and political lives of women. Zonta in New Zealand supports the work of the international organization and projects of its own. Current projects include the Sophie Elliot Foundation, which works to educate young people about violence prevention and intervention. Zonta New Zealand also hosts women's breakfasts on International Women's Day (March 8) across the country (Zonta International 2016).

Issues

Women in New Zealand are a diverse group, leading lives as individual as they are. But there are issues that many of them face living in the male-dominated patriarchal society. These include the rising levels of student debt many women incur, bullying (both on the playground and in the workplace), domestic violence, and rape culture.

Student Loan Debt

Tertiary students in New Zealand who are under 65 years old, meet residency requirements, and are enrolled in full-time study of a qualification are eligible for a student allowance from the government. This allowance is designed to help support a student's living expenses during study, although there are limitations (being able to access it for only 120 weeks if you are over 40). Many tertiary students in New Zealand take out a student loan to help finance their education. Student loans may pay for course fees, course-related costs such as texts and course materials, and costs related to living expenses. Residents of New Zealand under the age of 55 enrolled in full-time study are eligible for student loans. Loans are only available for up to 7 years. Those who have completed, or ended, their schooling, pay their student loan through automatic deduction based on an equation that considers income level and pay period. Repayment holidays are available to individuals who are overseas for up to one year (down from three years previously), and those who default on their loans while overseas may be arrested when they return to New Zealand (StudyLink 2016). In 2010, the average student loan debt upon leaving tertiary study was USD\$16,227, and the median yearly income was USD\$20,234 (Statistics New Zealand 2010b). In 2003, the New Zealand Union of

Students' Associations filed a claim with the Human Rights Commission that the student loan scheme discriminated against women because women usually took twice as long as men to repay their student loans due to the gender wage gap, resulting in higher interest paid (New Zealand Union Students' Associations 2016).

Bullying

Women of all ages may experience bullying within New Zealand. Bullying occurs on the playground and in the boardroom. Within the last decade, bullying has received more attention in New Zealand as new mediums, such as the Internet, have changed the nature of unsafe environments. Cyberbullying received a great deal of attention after a teenage girl committed suicide following being bullied in text messages (O'Rourke 2006). The organization NetSafe works to support responsible and safe online environments, including through their task force, National Cyber Bullying Taskforce. Bullying is also being considered more within workplaces, with many focusing on promoting positive working environments. In 2014, WorkSafe New Zealand released guidelines for how to manage bullying in the workplace (WorkSafe New Zealand 2014).

Domestic Violence

It is estimated that half of all violent crime, including homicides, kidnapping, and assaults, are incidents of family violence in New Zealand. The majority of family violence is perpetrated against women, with women being 91 percent of those admitted to hospitals because of family violence and 78 percent of partner homicides. The reasons behind family violence vary greatly, although key indicators such as poverty are common. The highest numbers of family violence in New Zealand are found among young couples with low levels of education living in low-income homes, especially ones with children (Ministry of Social Development, Wellington 2007). This often results in an intergenerational cycle of violence. Another strong association has been found with sporting events. In the year before New Zealand hosted the Rugby World Cup, groups across the country worked to acquire additional funding to help keep women safe from the increased levels of physical and sexual abuse expected due to the increase in hyper-masculinity and alcohol consumption associated with the event (Hager and Neville 2011). The nationwide campaign It's not OK began in 2007 to promote awareness around

family violence and decrease occurrences across the country (It's not OK 2016).

Rape Culture

Sexual violence is the fifth most common offense in New Zealand. It is estimated that one in five women in New Zealand are sexually assaulted and that 90 percent of sexual offenses go unreported (Morris 2003). Recent events have forced a dialogue about rape culture in the wider culture. Slutwalks organized by feminist groups in 2011 received heavy media attention. A recent example is a group of young men in Auckland who supported each other as they targeted girls, got them inebriated, pressured them into sex, and then bragged about it online on their Facebook page, Roast Busters (Russell 2014). No charges were brought against the young men, but the story propelled the conversation about rape culture to the fore again. On June 12, 2014, the Are You That Some1 campaign was launched by the government. This campaign aimed to reduce sexual assault in New Zealand.

North Korea

Overview of Country

North Korea, formally known as the Democratic People's Republic of Korea, is located in East Asia on the northern section of the Korean Peninsula. The country is bordered by China and Russia to the north and northwest. The

Korean Demilitarized Zone (DMZ), an established border dividing the Korean Peninsula, separates North Korea from its southern neighbor, South Korea. The Yellow Sea and Korea Bay border North Korea to the west, and the Sea of Japan borders it to the east. The country is approximately 46,528 square miles (120,540 sq. km) in area. Much of North Korea consists of mountains and highlands. However, most of the country's population lives closer to the coasts, where the geography is mostly plains and lowlands (Caraway 2016). During the summer season, the weather is hot, humid, and rainy, whereas during the winter season, the country receives frequent snowfall because of cold winds from Siberia. The country experiences four distinct seasons. Spring and fall are usually mild transition seasons between summer and winter (UNEP 2003).

As of 2015, the population in North Korea was 25,155,000 (WHO 2016). More than 60 percent of the population lives in urban areas. The largest urban area, Pyongyang, has a population of 2.863 million people and is the capital of the country. North Korea contains minimal racial and ethnic diversity. Small Chinese and Japanese communities exist within the country. The majority of the population identifies as Korean and speaks Korean, the national language (CIA 2016).

People have inhabited the Korean Peninsula since prehistoric times. Up until Japan seized the peninsula in 1910, Korea was an independent empire. After World War II, the Korean Peninsula was liberated from Japan and split into North Korea and South Korea, with North Korea controlled by the communist Soviet Union. North Korea failed during the Korean War to conquer South Korea, which was controlled by the United States. After suffering failure during the Korean War, the country turned against outside influence and became self-reliant. Three generations of Kim family leaders, including Kim Il-sung, Kim Jong-il, and Kim Jong-un, have all ruled the country in a similar manner, maintaining North Korea's limited exposure to the outside world. North Korea joined the United Nations in 1991, which has increased its financial support from outside organizations. In fact, because of widespread famine during the last few decades, the country has opened its doors to international nutritional aid (CIA 2016; Spoorenberg and Schwekendiek 2012). Though the country considers itself a socialist state today, leaders outside the country view North Korea as a totalitarian dictatorship.

Today, information from inside North Korea is limited. North Korea is not included in the UN Development

Programme's (UNDP) Gender Inequality Index. Yet, the UNDP continues to work with the country to improve the quality of human development and degree of gender equality. North Korean women still face a variety of challenges pertaining to equality, and all citizens are still deprived of warranted human rights. North Korea, with the help from the UNDP and other organizations, continues to work to improve living standards, access to health care, and life expectancy of North Korean women (UNDP 2012).

Girls and Teens

Compared to North Korea's total population, children ages 14 and under make up 21.2 percent of the population. Girls make up less than half of this age group, which is equal to 10.4 percent of the total North Korean population. Comparatively, boys in this age group make up 10.7 percent of the total North Korean population (CIA 2016). The mortality rate for North Korean children under 5 years of age has decreased over the last 20 years. Girls in the country have lower mortality rates than boys. However, 29 out of 1,000 girls under the age of 5 still die today (UNICEF 2013a). Many of these deaths are attributed to acute respiratory infections and diarrheal diseases (UNICEF DPRK 2003). Additionally, UNICEF reports a 100 percent literacy rate for both boys and girls in the country (UNICEF 2013a).

Nutrition

Though North Korea has seen advances in the status of childhood nutrition, many children in the country are still malnourished. Specifically, the amount and availability of food, unsanitary water, inadequate care by caregivers, and nutritional status of women all impact the nutrition of both girls and boys in the country. Food served to children in North Korea is typically watery and consists of only vegetables. Children receive limited amounts of meat, eggs, and other sources of protein, which makes them vulnerable to malnutrition. No gender differences exist in the nutritional status of children. UNICEF and other humanitarian organizations outside the country have made financial contributions to improve the nutritional status of North Korean children (UNICEF DPRK 2006).

Labor

Girls and boys are expected to perform certain roles according to their gender. Girls learn at a young age that their job is to take care of the home and nurture family

Women's Voices

Sunyoung Kim

I would like to share my mom's story, which has inspired me in so many ways.

She was growing up with a family of nine. Yes, she has six siblings. As the oldest daughter, she had to be responsible for house chores to help her mom, who lost her hearing during the Korean War. Due to poverty and the aftermath of the war, it seemed almost impossible to pursue her education. Most of girls stayed at home to help family—or rather, to support their male siblings to pursue their education. As the first child, she had to work at the factory at the age of 11 to support her family and pay for her tuition to go to school. She even had to clean the toilets as a penalty for not being able make tuition on time.

My grandfather saw my mom's talents and her persistence in education; he sold his last inheritance, a piece of land, to pay her first college tuition to be a pharmacist, which seemed nonsense to neighbors. Since then, she has taken care of all her siblings to keep her promise with her father. She recently retired at the age of 70.

Growing up as a girl carried a big burden. She had to count every penny to save and cut down her expenses. She still hates to use a laundry machine rather than do her wash by hand; she thinks it wastes too much water and electricity. She is still nagging me about how wasteful I am in using toilet paper whenever I visit Korea. I had to make sure to cut down my shower time too. It wasn't just for saving money, but to think of people left behind, suffering from poverty and a shortage of clean water and resources, as she experienced. Now she is supporting many students in mission schools and missionaries who work for people in need.

After growing up as a girl with my mom, going to school is my first priority. Believe it or not, I have a record with no absence throughout K–12. I'm thankful that she was there to support me as a girl, a mom, and an educator.

members, particularly family members who are younger. Boys have less of a role performing household duties. North Korea emphasizes boys' involvement with labor and political participation outside the home (UNICEF DPRK 2006).

Even though North Korea forbids children under the age of 16 from working, many school-aged children still work outside the home when particular jobs arise. For instance, many children work in fields or factories when production targets need to be met. Children also tend to help with snow removal on main roads. Reportedly, thousands of children in the country are imprisoned in labor camps with their parents and are required to perform strenuous physical labor (U.S. Department of State 2011).

Sexual Health

Inconsistent with other countries, North Korea reports no sexual abuse, teen pregnancies, sexually transmitted diseases, or abortions among girls. It is unclear if prevalence rates for these issues are, indeed, zero or if they are merely not reported. The country's economic challenges make it likely that young children are at risk for exploitation in exchange for money. Therefore, experts suggest

that education regarding sexual health is needed in North Korea (UNICEF DPRK 2006). A mere 7.9 percent of young people in the country have comprehensive knowledge of HIV (UNICEF 2013a). Girls in rural North Korea have lower rates of comprehensive knowledge of HIV, with only 3.8 percent having this knowledge compared to 10.8 percent of girls in urban areas (UNICEF 2013a).

Education

The North Korean government heavily controls education at all levels as well as citizens' access to sources of information. Information from outside the country is illegal, and people who are caught smuggling in foreign sources of influence, such as videotapes, DVDs, CDs, and sources of media, are often imprisoned in detention facilities. Citizens are also denied access to the Internet, as Internet access is typically only granted to high-ranking individuals (U.S. Department of State 2011).

The North Korean government emphasizes ideological education over academic education within the country's schools. The majority of books, performances, plays, and other sources of media that North Korean citizens are exposed to center around the Kim family (U.S. Department

of State 2011). Thus, the education North Koreans receive is highly censored, and their ability to access information other than what is regulated by the government, without consequences, is unlikely.

North Korea's national 12-year required education policy guarantees that all children in the country finish secondary education. The government reports that this education is free to citizens (North Korean Economy Watch 2014; UNICEF 2012). Even though the country requires education for all children, many children are still denied the opportunity to attend school. For instance, many orphans and children living on the streets do not receive an education. Children of adults who have disobeyed the government and children who are in labor camps with their parents are also often denied education. Many children are also unable to gain an education because of hidden costs associated with schooling (U.S. Department of State 2011). Furthermore, for financial reasons, many North Korean children drop out of school to work and help support their families financially (Korea Institute for National Unification 2013). These obstacles tend to impact girls more than boys (UNICEF DPRK 2006).

Early Childhood Education

The quality of early childhood education continues to improve within the country. It is estimated that more than 2 million children are enrolled in early childhood education in North Korea. Early childhood education includes nurseries and kindergarten. Children between the ages of three months and four years can attend nurseries. Nursery attendance is not required. Kindergarten is two years in length for children between the ages of five and six. The first year is optional. The second year of kindergarten is the first year of the required education. Nurseries and kindergartens are connected to factories, farms, and other places of employment. These organizations financially support the nurseries and kindergartens. It is unknown how these organizations have adapted to the economic hardships within the country and continue to ensure that the children in their early childhood centers are still receiving adequate resources (UNICEF DPRK 2006).

Compulsory Education

As of 2012, North Korea increased the number of required schooling years from 11 to 12. Today, after completing kindergarten, children are enrolled in primary school, which takes 5 years to complete (North Korean Economy Watch

2014). It is estimated that 99.2 percent of males and 99.1 percent of females participate in primary school (UNICEF 2013a). Of the country's primary school teachers, 86 percent are women (Korea Institute for National Unification 2013). Following 5 years of primary school, children enroll in secondary school, which takes 6 years to complete (North Korean Economy Watch 2014). An estimated 97.5 percent of males and 97.9 percent of females participate in secondary school (UNICEF 2013a). Of the country's secondary school teachers, 58 percent are women (Korea Institute for National Unification 2013). Children in rural areas of the country have lower school attendance rates compared to children in urban areas (UNICEF 2013b).

Education in North Korea promotes the socialist philosophy and includes experiential learning, where students receive hands-on experiences while participating in production and public life. Children participate in different tasks, which ultimately affects the type of employment they are assigned to after receiving their education. The goal of this education is to prepare children for life after schooling. Like many countries, children complete learning assessments in school to determine whether they have learned the objectives included in the curriculum. Results from learning assessments are also used to determine whether teachers are successfully teaching students what they are required to learn (UNICEF DPRK 2006).

Several concerns have been raised pertaining to schools in North Korea. As a result of natural disasters and economic hardships, the condition of North Korea's schools has significantly decreased. Thousands of schools and hundreds of thousands of books have been destroyed by floods within the last two decades. Even schools that survived these disasters still face significant damage to infrastructure. As the economy collapsed, the amount of money the government allocated to schools also decreased. Within the last decade, the government has committed to devoting more finances to improve the quality of schools. Additionally, experts have expressed concern that the school curriculum emphasizes gender stereotypes, limiting the quality of education for all students. For example, boys are exposed to more physical education, and girls are exposed to more home economics education (UNICEF DPRK 2006).

Higher Education

Higher education in North Korea includes either specialized colleges that last between two to three years or regular

colleges and universities that last between four and six years (UNICEF DPRK 2006). There are more than 300 institutions of higher education in the country. Institutions of higher education in North Korea are unlike those outside the country. Much of the instruction in North Korea pertains to political propaganda. Up to 50 percent of the classes offered for academic degrees pertain to political propaganda. It is estimated that two-thirds of college students are women, as most college-aged men are in the military (Library of Congress 2008).

Health

North Korea has experienced public health challenges in recent years. Economic hardship and natural disasters have contributed to insufficiencies within the country's quality of health care compared to many other countries in the world (CBS UNICEF 2010). Between 1990 and 2010, the life expectancy for North Koreans decreased two years, from 71 to 69 (UNICEF 2012). North Korea mandates regular annual checkups for all citizens and monthly checkups for citizens who have minor illnesses, such as the common cold (Library of Congress 2008). Maternal and early childhood malnourishment continue to be a challenge within the country (UNICEF 2013b). Additionally, citizens within the country, including those with health care training, reportedly lack information regarding health care, diseases, and healthy behaviors (Noh et al. 2015; UNICEF 2013b). Medical research within North Korea is said to be 15–20 years behind the rest of the world (Library of Congress 2008).

Access to Health Care

A lack of health care providers and facilities is not an issue within North Korea. Each district includes health care facilities, with many of these facilities attached to factories and other places of work (UNICEF DPRK 2006). It has been reported that for every 700 people in the country, there is one doctor. However, North Koreans are not able to choose which health care provider they visit for services. They are required to seek services from the provider to which they are assigned, and that is usually determined by the citizen's location (Library of Congress 2008). The quality of health care providers is unclear. Health care providers within the country receive minimal supervision, and their access to new knowledge and technology is limited. The training for health care providers stresses textbook knowledge instead

of hands-on experience (Grundy and Moodie 2008). The quality of medical facilities is also lacking because of the economic difficulties in the country. Currently, North Korea faces a shortage of medical supplies and medicine as well as a neglected infrastructure (UNICEF DPRK 2006). Medicines that do exist within the country are said to be extremely expensive, making it hard for North Koreans to access the medication they may need to live a healthy life (Library of Congress 2008).

Health care is reportedly accessible and free for all North Koreans, regardless of gender. However, the extent to which health care is actually accessible and free is in question. Outside health care providers who have worked with North Korean providers claim that health care is only offered to citizens who are able to pay for it. Those who cannot pay for services are often turned away (World Opinion 2010).

Maternal Health

Maternal malnutrition continues to be a challenge in North Korea and is linked to low birth weight and stunting (growth failure) in a child's early years. To facilitate better antenatal care, North Korean women are legally required to register pregnancies with the government (UNICEF DPRK 2006). Registering pregnancies allows the government to regulate the antenatal care women receive. In fact, more than 330,000 pregnant and lactating women received multiple micronutrient supplements in 2015 (UNICEF 2016). Additionally, 100 percent of women report at least one antenatal care visit, and more than 93 percent report at least four antenatal care visits. Similarly, 100 percent of women have at least one skilled attendant during their birthing process, whether this is a doctor, nurse, or midwife (UNICEF 2013b).

Though improvements have been made in the quality of care pregnant women receive, the country has seen a decline in the number of infants less than six months of age who are exclusively breastfed. Many North Korean women lack knowledge regarding the importance of exclusively breastfeeding their newborns. The lack of breastfeeding in the country contributes to the overall health and nutrition of the country's children (UNICEF DPRK 2006). Maternity leave in the country is substantial compared to other countries, consisting of two months prior to delivery and a mandatory three months after delivery with full pay (CBS 2013; Park 2011). The mandatory termination of maternity leave at three months may disrupt breastfeeding, which

may impact the exclusive breastfeeding rates (UNICEF 2003). Overall, a need exists for the country to promote early initiation breastfeeding and exclusive breastfeeding for at least six months (CBS 2013).

Compared to many other countries in Asia, the rate of contraceptive use in North Korea is relatively high. An estimated 69 percent of women in the country report using contraceptives (UNICEF 2013a). Nevertheless, of women in the country who report undergoing an abortion, many do so because of failed contraceptive use. Other North Korean women choose to receive an abortion because of an unwanted pregnancy. The abortion rate of 121 out of 1,000 births suggests a need for family planning information to be dispersed in the country (UNICEF DPRK 2006; WHO 2009).

Diseases and Disorders

Compared to other countries in Asia, North Korea has higher rates of premature deaths due to cerebrovascular disease; cancers (lung, liver, and stomach); and road injuries (Global Burden of Disease 2016). Tuberculosis (TB) is also a major health concern for North Koreans. TB causes 2,300 deaths every year within the country. Treatment for TB continues to improve and decrease mortality rates. However, as the need for treatment persists, access to the treatment may become an issue (UNICEF DPRK 2006). Additionally, the country has seen a reemergence of vivax malaria, likely due to the increased breeding of mosquitoes from less pesticide use and new irrigation methods. Even though vivax malaria is typically nonfatal, pregnant women and their unborn children are at high risk for dangerous consequences, such as anemia, low birth weight, and maternal or fetal mortality (UNICEF DPRK 2006).

It is estimated that few, if any, North Koreans are infected with HIV/AIDS. The neighboring countries of China and South Korea have small but growing rates of HIV/AIDS (0.11% and 0.1%, respectively), suggesting the need for the North Korean government to develop a strategic plan and promote education toward the issue. Even today, citizens in the country, including health professionals, have minimal knowledge on the issue of HIV/AIDS (UNICEF DPRK 2006).

Though North Korea still faces high rates of certain diseases, immunizations have aided in disease prevention. The country has started to emphasize the importance of preventing diseases through immunizations, and international support has helped the country afford this form

of prevention (Grundy, Biggs, and Hipgrave 2015). For instance, the government reports a 97.2 percent vaccination rate against hepatitis B. However, it is unclear whether vaccination coverage rates are as extensive as the government reports (UNICEF DPRK 2006). The country's lack of refrigerators with thermometers, reliable vehicles, and inaccessible roads contribute to the difficulty distributing immunizations throughout the country (Grundy, Biggs, and Hipgrave 2015).

Compared to physical illnesses, mental health issues are discussed less within North Korea. Few North Koreans, including doctors, have knowledge regarding many mental health issues. Schizophrenia, which includes delusions and hallucinations, has been reported as the mental health issue with the highest prevalence rate in the country. Depression is said to be increasing significantly among North Koreans, but few doctors in the country report learning about or using the term *depression*. The lack of knowledge and discussion about mental health in North Korea suggests that many citizens may be suffering but are not receiving adequate, if any, treatment (Cheung 1991; Noh et al. 2015).

Finally, illegal drug use and addiction is on the rise within North Korea. Methamphetamine has the highest usage and addiction rate of the drugs used in the country. The lack of knowledge about the dangers of drug use contributes to this significant public health issue. Additionally, the drug production business within the country contributes to the problem. North Korea has been known to produce and distribute amphetamine stimulants and narcotics. Most of their drugs are smuggled over the Chinese border, where China repackages and distributes the drugs to the rest of the world (HRNK 2014).

Employment

North Korea has experienced labor shortages due to the war and the country building up the labor force to maintain its status as a socialist economy. These events have contributed to North Korean women being equally represented in the labor force compared to men. However, few women are assigned to high-level jobs or manager positions (Korea Institute for National Unification 2013; U.S. Department of State 2011). Compared to men, women face employment discrimination, as they are typically assigned to lower-paying, simpler, and lower-status jobs (Korea Institute for National Unification 2013). Women are also the first to be laid off from jobs when economic challenges occur because men's ability to work is valued

more than women's (Park 2011). Additionally, there is a gendered nature to the jobs men and women are assigned to perform in the country. Specifically, for jobs with the government, men are prioritized over women. Women are typically assigned to work in such fields as health, education, and communications. In fact, a reported 100 percent of nurses within the country are women. To obtain higher-paying and respected jobs, many women reportedly offer sexual favors or monetary bribes.

Women in rural areas face more discrimination compared to women in urban areas. Unless a rural woman joins the military or progresses to college, she is expected to work as a farmer (Korea Institute for National Unification 2013). Despite these challenges in the workforce, North Korea does guarantee privileges for women who are expecting a baby or have recently given birth. The country requires paid breaks during the work day for women to be able to breastfeed, encourages companies to transfer pregnant women to less strenuous work, and bans companies from forcing pregnant and breastfeeding women to work overtime or at night (Park 2011). The age of retirement for women in North Korea is 55 years old, whereas for men it is 60 years old (Explore North Korea 2016).

Family Life

In 1946, North Korea passed the Law on Sexual Equality, which warranted women's rights in family matters. The law guaranteed women's rights to child support, alimony, and other issues related to marriage and divorce. This law also prohibits polygamy, prostitution, and concubinage (when an unwed woman lives with a man to perform household work and sexual favors). Despite this law, North Korea is still highly influenced by Confucian tradition, which promotes the practice of patriarchy. Therefore, barriers still exist for women, as men are viewed with higher status compared to women (Park 2011).

The Kim family has traditionally encouraged North Koreans to love their children and to respect the elderly. Children are taught manners at a young age and to love and obey both their parents and the North Korean government. Children can often be seen bowing to their parents and other individuals of authority as a way to express their respect (Library of Congress 2008). The Kim family has also encouraged North Koreans to live frugally. Due to the economic challenges within the country, the size of families has decreased in recent decades. The typical family in North Korea consists of four or five people, with women

having an average of two children. Today, only two generations tend to live in one house together, compared to traditional Korean families that oftentimes included three or more generations living together. Despite changing views toward women in the country, sons are still more desired than daughters for financial purposes and carrying on the family name (Library of Congress 2008).

Marriage

Compared to years past, women in North Korea tend to marry later in life. North Korean women are legally allowed to marry at age 17, whereas men cannot legally marry until age 18. Despite these legal ages for marriage, most women today do not marry until they are between the ages of 24 and 26, and men do not marry until they are between the ages of 26 and 28 (UNICEF DPRK 2006). Many women even view marriage as optional, as opposed to required, with many viewing being single as preferable. This shift in women's views toward marriage can be attributed to the changing gender roles and opportunities for women outside the home (Park 2011). Furthermore, sexual relationships prior to marriage are prohibited. Couples who engage in a sexual relationship prior to marriage risk condemnation from their families (Library of Congress 2008).

North Koreans who do choose to get married have an engagement ceremony with both of their families prior to the wedding. This ceremony is viewed as an appreciation to the bride's family for giving their daughter away. During the ceremony, the groom's family gifts the bride with makeup and clothing for the wedding day. The wedding date is set by elders from the two families. Most weddings occur during the fall season, as summer and winter weather are too extreme. Weddings in North Korea are typically formal and traditional. The bride wears the *hanbok*, or the traditional Korean dress, and the groom dresses in Western-style suits. The weddings are usually held in large spaces, such as community centers, restaurants, or places of work. For wedding gifts, the bride and groom usually receive currency or food from guests, usually corn or rice (Grant 2014). During the last few decades, "love marriages," when the couple decides to wed because they have fallen in love, have become more popular among North Koreans. The rate of marriages arranged by families has been on the decrease. Yet, children still typically seek their parents' approval before getting married (Grant 2014). The marriage between a rural female and urban male is

typically opposed, as this is a way to limit relocation to the city (Library of Congress 2008).

Many people who have escaped North Korea report a high rate of unhappy marriages within the country. This unhappiness is often due to the stress and high demands of balancing work obligations both outside and inside the home. Couples rarely have time for leisure activities and spend minimal time alone together (Library of Congress 2008).

Divorce

Divorce rates have increased within the country due to marital conflict, domestic violence, and women's involvement in business. Though divorce is legal within North Korea, the process does not come without corruption. The process for a divorce is long, challenging, and requires financial means. Judges and lawyers often have to be bribed with large sums of money for the divorce case to continue moving forward. Even with bribery, the divorce process usually takes at least three years (Korea Institute for National Unification 2015). It has also been reported that divorce can prevent a person from advancing in their career, and it oftentimes results in a demotion at work. Additionally, many people choose not to pursue a divorce for fear that they will lose their children. Even though divorce rates have increased, divorce is still viewed negatively within the country (Library of Congress 2008).

Lesbian, Gay, Bisexual, and Transgender Rights

Limited information is available regarding the rights of lesbian, gay, bisexual, and transgender (LGBT) individuals in North Korea. North Korea does not have laws against LGBT individuals; however, there are no laws ensuring the rights of LGBT individuals either (U.S. Department of State 2011). Even for North Korean individuals who identify as LGBT, most will still marry a person of the opposite sex and have children due to traditional gender roles. For the most part, LGBT individuals in North Korea do not publicly identify themselves as such (Hotham 2013).

Child-Rearing

Women have typically held the role of raising and caring for the children in the home. However, with the increasing economic opportunities for women outside the home, roles within the home are changing as well. With increased empowerment, women are now insisting that

their husbands assist with child-rearing when the family is together at home (Park 2011). For most of the day, children are in child care while their parents are at work (Library of Congress 2008). Moreover, corporal punishment is a legal form of discipline within North Korea, as it is not considered violence or child abuse (Global Initiative to End All Corporal Punishment of Children 2016).

Gender Roles and Family Structure

Because of economic hardship, North Korean women are forced to work outside the home in addition to performing the household work. Women working outside the home challenge the typical patriarchal family structure, where men have the responsibility of working outside the home and women are assigned to work in the home, performing household duties. This change in family structure has resulted in women enduring harsh conditions both outside and within the home, as they try and balance their work duties and the peace with male family members. However, more women have begun to take on work outside the home, making this shift in gender roles more accepted among families. These changes have also led to the gradual improvement of women's status in the country (Korea Institute for National Unification 2013). However, most North Korean women still seem to accept that men are the head of the household (Park 2011).

Politics

Participation in Government

Women hold approximately 20 percent of the positions in the North Korean legislature. Even though women are represented in the legislature, the amount of power and responsibility they have is said to be limited. The United Nations has conveyed concern regarding the number of North Korean women in political positions as well as the level of authority actually held by the women in government (Korea Institute for National Unification 2013).

Laws

Historically, North Korea has successfully passed laws intended to ensure women's equality. In addition to the previously discussed Law on Sexual Equality, which protects women's rights and independence in family matters, additional laws have been passed to promote women's health, safety, and independence. For example, the Socialist Labour

Law of 1978 protects pregnant women from having to perform strenuous work and women of infants from having to work late hours. Additionally, North Korea's joining with the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) in 2001 confirmed the country's commitment to work toward attaining women's equality (UNICEF DPRK 2006). Although these laws exist to guarantee women's rights and equality, the extent to which these laws are enforced is unknown, with many experts claiming that the status of women in the country is not consistent with these laws (Korea Institute for National Unification 2013; U.S. Department of State 2011).

Women's Associations

It is unknown whether feminist organizations exist within the country today. Given the severe regulations against nongovernmental organizations (NGOs), feminist organizations in North Korea may not openly proclaim their existence. However, one women's association that does exist in the country is the Women's League. If North Korean women between the ages of 31 and 60 are not members of other government groups, they are required to join the Women's League. Despite the title, this organization does not promote women's empowerment and rights. This strict organization serves as a way to spread the country's ideology and assemble women to help build the country's socialist economy (Korea Institute for National Unification 2013).

Religious and Cultural Roles

North Korea restricts religious freedom among its citizens, as it believes religion poses a threat to the country's socialist ideology. North Koreans who are found guilty of religious activity are subject to punishment, such as torture, imprisonment, or execution, depending on the case. Religious activity includes any praying, singing of hymns, owning religious items, participating in religious events, or associating with other religious individuals. Christians in particular are under persecution in the country and oftentimes receive the most severe punishments. Tens of thousands of Christians are imprisoned in North Korea and face intense labor or execution. It is difficult to confirm the number of followers of religious faiths, as people tend to practice privately. However, it is estimated that between 200,000 and 400,000 people in the country are Christian. In addition, there is said to be Buddhist and Russian Orthodox Church followers in the country

as well, but estimates of followers are unknown. Though punishment is severe if caught, some radio stations from China and South Korea are able to transmit religious programming into North Korea for those who possess a radio. Despite accounts of punishment for religious activity, the North Korean government still claims that they do not violate religious freedom or punish citizens for religious involvement (U.S. Commission on International Religious Freedom 2016).

Celebrations

Most of the holidays celebrated in the country relate to the North Korean government or their leader. The most important celebration is Day of the Sun, which occurs every year on April 15. This day honors the birthday of Kim Il-sung, the founder of North Korea. This celebration involves dancing in the streets, where many women wear the traditional Korean dress. Consistent with other Asian countries, North Korea also celebrates Lunar New Year during January. During this celebration, food is shared with family members, and traditional folk games are played (Explore North Korea 2016).

Issues

Travel Restrictions

Travel abroad is severely limited for most North Koreans. Those who are permitted a passport to travel outside the country are typically those who have been inspected for political loyalty to the country. Of the North Koreans who have left the country, most have left without permission and face substantial penalties, such as forced labor, prison, or the death penalty, depending on the nature of the case. North Korea has become increasingly strict about its citizens not crossing the border and has even begun to threaten harsher penalties for those who do leave (HRW 2015). North Koreans who leave the country without permission are treated as refugees by the United Nations. The majority of North Koreans living outside the country are women (South Korean Ministry of Unification 2005). Many of these women cross the border to China and enter into cohabiting relationships with Chinese men (HRW 2015).

Detention Facility Conditions

Severe human rights violations occur within North Korean detention centers. Inmates, who are often imprisoned for

speaking or acting out against the government, face torture, forced labor, lack of medical care, and poor nutrition (Korea Institute for National Unification 2013). Imprisoned women are also at risk for rape by prison guards. Because of the extreme conditions in some detention facilities, it is not likely that many prisoners survive (U.S. Department of State 2011). Though the exact number of imprisoned North Koreans is unknown, satellite images lead experts to estimate 80,000–120,000 people are detained. The proportion of those detained who are women is also unknown (Korea Institute for National Unification 2013). Women are separated from men in certain facilities (U.S. Department of State 2011).

Many of the women in detention facilities were caught trying to cross the border to China. These women face harsh punishment in the facilities, where they are often beaten and forced to undergo uterine inspections. Pregnant women are often subject to forced abortion (Korea Institute for National Unification 2013).

Human Trafficking

North Korea is a source country for human trafficking victims of sexual exploitation and forced labor. A large portion of North Korean trafficking victims cross the Chinese border voluntarily. Many of these women are abducted or lured by traffickers and forced into prostitution, sold as brides to Chinese men, or forced into slave labor. Other North Korean victims of trafficking are lured across the Chinese border with the promise of employment in a factory or restaurant. However, when many of these women reach China, they become victims of sexual violence in their new places of employment. Many North Korean women who are victims of sex trafficking in China become pregnant. If the child is born in China, the North Korean mother has minimal rights over her child, even if the father is Chinese. Children born in China to North Korean women are also denied rights to education (Park 2011).

Violence

Violence against women is a problem both within homes and outside homes in North Korea. Even though the country has laws that condemn violence against women, such as the Law on Sexual Equality, violence still occurs because of the patriarchal influence in the country. As women's economic opportunities have increased within recent years, domestic violence has increased as well. Women have become more independent, lessening the degree to

which they rely on their husbands. As men's traditional role as the breadwinner lessens, this can cause tension within the home, which often gets taken out on women in the form of violence (Park 2011). It is unknown how North Korea enforces laws against violence, or if they do. Similarly, North Korean women who have escaped the country report that few options and services exist for women who have been subject to this violence (U.S. Department of State 2011).

P

Pakistan

Overview of Country

The Islamic Republic of Pakistan encompasses about 307,000 square miles (796,095 sq. km) of land area and had a population of 188.9 million in 2015 (the U.S. Census Bureau put this figure at 202 million in July 2016). It lies at the intersection of four roughly coherent economic groups: the Indian subcontinent, China, Central Asia and Russia, and the Middle East. About 600 miles (1,050 km) of Pakistan's southern boundary consists of Arabian Sea coastline; the country borders the Islamic Republics of Iran and Afghanistan, the Russian Federation, the People's Republic of China, and the Republic of India. Approximately 80–85 percent of Pakistanis are Sunni Muslims, and 10–15 percent are Shia; Hindus, Sikhs, and Christians make up 3.6 percent of the population. Major languages include variations of Punjabi, Pashto, Sindhi, Saraiki, Urdu, and Balochi; Urdu has been widely adopted as a second language, but English remains the primary language of instruction in urban centers. It is also the official language for government communication.

One-third of Pakistan consists of the northern mountain ranges (Karakorum, Hindukush, and Himalayan) and is home to the largest mass of glaciated ice in the world, barring the earth's poles. The country's central-eastern fertile plains are drained primarily by the Indus, Jhelum,

Chenab, Ravi, and Sutlej Rivers—in accordance with the 1960 Indus Waters Treaty. Pakistan controls flow of the Indus, Chenab, and Jhelum, while India controls the Beas, Ravi, and Sutlej. The Balochistan Plateau extends from Pakistan's midwest border through the southeast. The Thar and Kharan Deserts extend east and west, respectively.

Pakistan came into being as a sovereign nation-state in 1947, with the end of British imperial rule over the Indian subcontinent. The country took shape under the leadership of Mohammad Ali Jinnah (1876–1948) and the All-India Muslim League, a political party that originated in the literary and social reformist Aligarh movement initiated by philosopher and activist Syed Ahmad bin Muttaqi Khan (1817–1898) and his contemporaries circa 1875.

The Muslim League campaigned for the partition of British colonial territories to secure representation for and to safeguard the rights and interests of the Islamic minority throughout South Asia. The state of Pakistan originally consisted of a western arm, including Khyber Pakhtunkhwa (formerly the North-West Frontier Province), part of the Punjab, Sindh, and Balochistan, as well as an eastern, Bengali-speaking region separated from the rest by nearly 1,200 miles of Indian territory. The linguistic and cultural differences, chronic underrepresentation of East Pakistani concerns in central government policy making, and chronic underdevelopment led to the birth of a disillusioned, nationalist movement that resulted in Bangladesh's secession in 1971.

The accompanying “war of independence” was bitter and brutal. Pakistan’s parliamentary democracy had experienced numerous upheavals between 1947 and 1958, enduring widespread Hindu-Muslim communal violence during Partition and the accompanying exchange of populations, two wars with India over Kashmir (in 1948 and in 1965), the abortive institution of two separate constitutions, and several forcible changes of governments’ attempting to manage the demands of an ethnically and geographically diverse population. Yahya Khan became the second president of Pakistan to declare martial law in 1969 and launched Operations Blitz and Searchlight following the divisive and inconclusive 1970 elections to eliminate intellectuals, dissidents, and nationalists in East Pakistan.

In addition to perpetrating extrajudicial killings and causing the displacement of several million people, Khan’s army is widely accused of having engaged in systematic, genocidal rape. Significantly, this tactic was supported and facilitated by military as well as religious leaders’ representations of the Bangla “race” as inherently treasonous and inferior as well as of Bangla women as objects or war booty (Jahan 2008, 250). South Asian sectarian ire (in Pakistan directed against the Ahmadi population, Hazara refugees from Afghanistan, or in some instances against non-Muslim citizens) has often followed this rhetorical pattern, leading to the weaponization of violence against women and disproportionately affecting them.

Conflicting reports on the number of people who lost their lives during the 1971 conflict range from 26,000 to 3 million. Sarmila Bose’s *Dead Reckoning* (2011) has challenged the nationalist and ostensibly humanitarian narratives perpetuated by the Bangladeshi and Indian establishments, respectively, claiming that the inflation of numbers and relentless focus on Pakistani atrocities is disrespectful to the real (though fewer) victims and makes impossible any objective consideration of corresponding violence perpetrated against Bihari Muslims or nonnationalist factions in East Pakistan by the rebels, universally and unequivocally celebrated as heroes. Despite receiving positive academic attention, however, her research and presentation remains controversial, and the prevailing political narratives in South Asia decisively condemn the actions of the Pakistani army through *The Longest August*.

Zulfikar Ali Bhutto’s civilian government attempted cultural and constitutional reforms following the war, but his leftist Pakistan People’s Party (PPP) was overthrown by Zia-ul-Haq in 1977, who executed Bhutto and replaced the legislative assembly with a consultative Majlis-e-Shoora.

Eleven years of economic deregulation, rapid industrial development, curtailment of civil liberties and secular law, and increased armament and militarization followed, including a long and active U.S.-funded involvement with Afghan mujahideen fighting the Soviet-backed communist regime.

Perhaps the most pervasively pernicious aspect of Zia’s approach, at least for women in Pakistan, was the promulgation of the Hudood Ordinances (1979), which replaced parts of the secular penal code with sharia law. In addition to instituting inhumane punishment (such as stoning, flogging, and whipping) for offenses such as theft, alcohol consumption, and bearing false witness, Hudood’s Zina Ordinance criminalized extramarital sex, required the evidence of four male witnesses to penetrative rape (and penalized women victims who failed to produce them), disregarded both statutory and marital rape as offenses, and facilitated the notion of personal physical retribution—including honor killing. The Qanun-e-Shahadat (Law of Evidence, passed in 1984) subordinated evidence given by women to that presented by men. Between 2005 and 2006, Pervez Musharraf—the architect of Pakistan’s fourth military coup (ousting Nawaz Sharif as Prime Minister in 1999)—announced his intention to repeal (later, to amend) the provisions of Hudood. The Women’s Protection Bill of 2006 replaced rape under the penal code but failed to address the problems of accusation and witness. It also legitimized DNA evidence, but again failed to factor in the inadequacies of Pakistan’s single DNA testing lab for the purpose of processing evidence relating to all sexual assault cases. During his term as President, Musharraf did, however, increase reservation for women in the National Assembly to 60 seats and in the provincial assemblies to 128 seats.

Zulfikar’s daughter, Benazir Bhutto, became the first female prime minister of Pakistan after Zia’s death in 1988. Though her rise to political office owed much to popular perceptions of her and her family’s sufferings in custody, and later in exile, Bhutto established herself on the international stage as a highly accomplished, progressive, and authoritative (but not authoritarian) diplomatic force. Like Zia, Bhutto embarked on a sustained project to foster alliances with America and Europe. However, her adherence to the Western capitalist model of modernization stopped short of continuing Zia’s proxy war on behalf of the United States. Bhutto made serious attempts to broker a peaceful partnership with Indian prime minister Rajiva Gandhi (like Bhutto, the scion of a political dynasty) and

developed the Pakistani space and nuclear energy programs. However, Bhutto's years in power (interrupted by a Nawaz Sharif term) were mired in charges of corruption against her husband. Her outlook toward trade unions was hostile, and her relationship with women's organizations was marked by neglect and unease, alternating with "bonhomie and the spirit of mutual accommodation" (Saigol 2016, 23). Her commitment to Pakistan's nuclear weapons program proved expensive, both in political and financial terms, and her continuation of Sharif's Operation Blue Fox to "cleanse" Karachi of "anti-social elements" left thousands dead or disappeared.

It is possible to argue that Bhutto made a far more effective leader of the opposition than she did a premier. Her critique of Zia-ul-Haq's and Pervez Musharraf's undemocratic regimes added force and provided increased visibility to resistance movements and protest against abuses within as well as outside Pakistan. And her careful cultivation of her image as a female, secular rationalist, pragmatic, formidably well-informed, articulate, and urbane actor in the Global South resonates powerfully at the intersections of ethnicity/race, religion, sex/gender, and political agency. On the other hand, despite her symbolic significance as a member of the Council of Women World Leaders, Bhutto's predominantly neoliberal policies, diplomatic sufferance of and forbearance toward the Taliban in neighboring Afghanistan, and frequent social conservatism (exemplified by her antiabortion stance and hardline approach toward trade unions) benefited the privileged, wealthy, male elite far more than the majority of her country's populace.

Moreover, through the 1990s, vocal and stringently liberal women's organizations lost many of their platforms. The spirit of solidarity that had sustained them and their painstakingly assembled authority waned with the proliferation of nongovernmental organizations (NGOs) that depoliticized sex, women's issues, violence, and the polarization of power and powerlessness; conflated equality with equity and rights with statistic-heavy and GDP-based definitions of development; and facilitated the global, neoliberal move toward "privatizing state functions" (Saigol 2016, 21).

The Clinton and Bush administrations' acceptance, encouragement, and perpetuation of Musharraf's self-representation as a liberal constituted a multilayered, multi-lateral political strategy that furthered both the control and the racially fraught and divisive narrative of the troubled and radically Islamist regions through the Middle East and

South and Southeast Asia. The geographic location of Pakistan, its need for international aid, and its volatile history of negotiable, shifting allegiances and priorities made it a valuable ally to the United States, particularly after September 11, 2001. The Global War on Terror resulted in rapid polarization of world powers. Musharraf's aim through his final six years in power was demonstrably to navigate and balance his alliances with (and prove his indispensability to) the warring West and the domestically influential religious right. While he managed to do so more or less successfully until 2007, his handling of the Lal Masjid crisis sparked a series of suicide bombings and set spurs into autocratic, dogma-inspired patterns of social conduct that manifest repeatedly, and increasingly, as violence against women.

Girls and Teens

Initiatives have chronicled stories of young women who struggle against societal odds or institutional obstacles to receive an education. These international groups consist of Girl Rising, Women in Development (WID), and the UN's Education for All program. National groups are the Pakistan Girls' Education Initiative (launched in 2010), various projects run by the Ministries of Education and Women's Development, and such groups as Khwendo Kor, the Mukhtar Mai Women's Organization, and the All Pakistan Women's Association.

The prevailing rhetoric of girls' emancipation through formal schooling alone has been critiqued as apolitical and ahistorical by Khoja-Moolji (2015), Dogra (2011), and grassroots women's movements. The Women's Action Forum and the Aurat Foundation are two such groups. Scholars include Chakravarti (2008) and Purewal (2015), writing for the Institute of Development Studies, and Zia (2003), Rose (2015), and Channa (2016), writing for UNESCO's *Prospects* series. Fieldwork and research by organizations such as Shirkat Gah through the 1970s, 1980s, and 1990s demonstrated that without a concerted effort to address cultural taboos associated with women's sexuality, the enrollment of girls and young women in schools does not necessarily result in the advancement of their individual freedom within communities. Alcott and Rose (2015) examine the intersectional nature of these disparities, for instance, by querying not only which subsections of communities in rural areas of Pakistan are able to access formal curricula but also how cross-sectional privilege, or the range of teaching resources and facilities available to students, corresponds with what the curricula contain.

Furthermore, discussions about “modern” empowerment for women keep in place the systemic deprioritization of allowing women control of their bodies and equal wages.

Nevertheless, the long-term benefits of cultural and educational frameworks include increased visibility of problems that relate to social welfare, maternal care, disability rights, media representation of violence against women, and access to information about health care (Casanova and Jafar 2013; Jafar and Casanova 2013). However, providing Pakistani women with access to education has shown to improve women’s earning power and self-identification as agents of national growth and positive change (Joseph 2003–2007; Jafar 2016).

Education

While 38 percent of out-of-school boys’ parents report that their son was not willing to be enrolled, 34 percent of out-of-school girls’ parents did not allow them to attend school in Pakistan. While 51 percent of boys who drop out of school report that they did not wish to continue, only 28 percent of girls had the same reason: 29 percent had to drop out to help with work, and 27 percent were not permitted to continue their schooling.

In Pakistan, 57 percent of the poorest families are unable or unwilling to send their children to school; among the wealthiest, this figure is 10 percent and largely consists of girls. While enrollment to higher secondary schools in the public sector is 1.298 million, 0.366 million higher secondary school students are enrolled in private schools. Similarly, private universities cater only to 14 percent of a total 1.144 million students enrolled in degree colleges. And finally, while only 44 percent of enrolled students are girls, 58 percent of teachers are women.

Literacy

Pakistan has an average literacy rate of 58–70 percent for men, and 47 percent of women can read and write. The 2014–2015 National Education Management Information System (NEMIS) Pakistan Education Statistics report released by the Ministry of Federal Education and Professional Training and the Academy of Education Planning and Management highlighted that more than 24 million children 5–16 years old are out of school in the country. (Data collected by the nongovernmental Alif Ailaan indicates this number may be as high as 25.2 million as of 2015.) UNESCO reports that, as of 2010, Pakistan was spending 2.3 percent of its gross national product (GNP)

on education, which amounts to one-seventh of its defense budget.

In addition to the gender imbalance in education, there is a great deal of disparity by region as well. In Balochistan, 66 percent of school-age children are out of school; the figure drops to 47 percent in Punjab (though 52% of Pakistan’s out-of-school children live in the populous province). The Federally Administered Tribal Areas have the highest figures for girls out of school: 75.2 percent. Similarly, two-thirds of the girls from Swat Valley (home to Malala Yousafzai) have never been to school.

Health

Pakistan ranks 146th on the Human Development Index (HDI). About 2.2 percent of the gross domestic product (GDP) is spent on health care. According to the World Health Organization (WHO), life expectancy for women in Pakistan is 67.5 years (in comparison with 65.5 years for men).

Pakistan’s average score for 13 core international health capacity indicators is 43 (Mexico, for instance, scores 97). About 91 percent of the population has access to drinking water, and 64 percent has access to adequate sanitation. Natural disasters, such as the 2005 earthquake that killed 83,000 people; periodic floods in Sindh province; and militancy in the north and west make health care access problematic.

While the government ostensibly offers a vast range of services and facilities for its population’s health care and has launched or instituted a wide array of projects for improving delivery systems and disseminating knowledge about prevention, risk, and available resources, these interventions are sporadic, overlap as competing organizations disregard work done and progress made by others, and are fragmented.

Diseases and Disorders

Pakistan is one of three countries with remaining cases of endemic polio and has high rates of tubercular and acute respiratory infections, malaria, and other vaccine-preventable diseases; diarrhea; and malnutrition. In 2012, 231 cases of tuberculosis (TB) were reported per 100,000 persons.

Maternal mortality is 178 per 100,000 live births. Skilled health personnel attend to 52 percent of births, and in 2014, Pakistan averaged 0.2 new HIV infections per 100 uninfected population. About 47 percent of Pakistani

women (in comparison with 76% globally) have their family planning needs met through modern methods of contraception.

Employment

Throughout the country, 52 percent of the population live near what the *Human Development Report* for 2015 defines as multidimensional poverty; 15 percent live in severe poverty. According to the Food and Agricultural Organisation, 30.47 hectares of land in Pakistan are arable, though per capita figures have declined steadily since 1961, from 0.665 hectares per person to 0.168 in 2013. Agriculture accounts for about 21 percent of Pakistan's GDP, and wheat, sugarcane, cotton, and rice make up more than 75 percent of crop production.

Major urban centers include Karachi, Lahore, Faisalabad, Rawalpindi, Multan, Hyderabad, Gujranwala, Peshawar, Quetta, and the capital, Islamabad. Sialkot, Jhelum, and Larkana are also culturally significant; in Gwadar—an underutilized port—the China Overseas Port Holding Company began construction of a USD\$2 million special economic zone in June 2016. Approximately 40 percent of Pakistan's population lives in cities, and about 44 percent of the labor force is employed in the agricultural sector. The country's GDP is valued at USD\$270 billion and makes up less than 2.5 percent of the global economy.

The civilian labor force consists of 45.45 percent of Pakistanis; 42.74 percent are employed in some capacity, including part-time and flextime workers.

Job and Career Opportunities

In theory, Pakistani women enjoy equal employment rights to men. In practice, though, women are disproportionately employed in care work, occupy administrative and low middle-management positions, and have only recently begun to participate in specialized law enforcement, military, and peace-keeping sectors.

Only 22 percent of the female population of working age are participants in the country's formal economic activities; over the past 15 years, the percentage of women identifying as self-employed has risen from 15.7 percent to 33.6 percent, and those categorized as unpaid domestic assistants has risen from 47 percent to 61 percent. Women employers constitute 0.1 percent of the potential female labor force in Pakistan; professionals constitute 6.4 percent, and 0.9 percent do work requiring technical expertise.

The *Global Gender Gap Report* for 2015 indicates that Pakistani women on average earn 23 percent less than their male counterparts. Their estimated income averages PKR 9,760 per month (USD\$94), and though Pakistan has ratified the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW), employers, particularly of undocumented, unskilled, migrant, and agricultural workers, are able to exploit them with impunity. Both male and female workers are liable to be discriminated against based on ethnicity and religion; manual laborers, indentured farm workers, and domestic staff are paid a pittance, in goods, or forced to work for sustenance and shelter. Women receive no formalized benefit for emotional labor or domestic care.

Maternity Leave

While Section 37(e) of the Pakistani Constitution as well as four separate laws (referring to the rights of workers in mines, civil servants, industrial and commercial organizations, and agricultural and domestic workers) nominally safeguard the rights of new mothers. Maternity leave, paid or unpaid, varies widely across regions, sectors, and with reference to the dynamics of employee-employer relations.

The 2011 Eighteenth Amendment to the Constitution, meant to roll back some of the excessive powers assumed by Zia-ul-Haq and Pervez Musharraf, repealed these provisions and left it up to each province to institutionalize workers' welfare. With the exception of civil servants, entitled by law in each province to 90 days (up to 6 weeks before and after delivery), employees must negotiate suffering of their pregnancy at work as best as they are individually able.

Day Care

Employers are required by law to provide or pay for day care, but they are notoriously lax in doing so. Organizations concerned about their reputations occasionally make provisions for mothers of young children. However, the concept of maternal care is narrowly defined: within Pakistani society as a whole, as well as within the highly competitive corporate culture, a worker's dependents are viewed as a liability, and they are the working mom's responsibility. Women (as well as men) are likelier to depend on (usually female) family members to care for children during the work day than on employer-provided day care.

Family Life

Familial bonds are highly regarded in Pakistan, but they are subject to both hierarchical, patriarchal norms and religious codes. According to the Pew Research Center's 2013 report, Pakistan ranks below Turkey, Malaysia, and Kenya on issues surrounding LGBTQ rights. Homosexuality is illegal both under penal and sharia law (and is punishable by death in Balochistan); it is legal to change one's gender (except in the Federally Administered Tribal Areas), but the issuance of state-recognized proof of a gender identity other than that assigned at birth requires surgery and comprehensive medical documentation.

Gender Roles

Gender roles are strictly enforced. Transgender people and identities are recognized and permitted, as is gender play for sexual pleasure, which is even expected from sex workers. Sex work and prostitution is not, however, a respected profession. Nonbinary, nonheteronormative sexuality is considered an invitation to abuse; difference is ostracized and often penalized severely.

In urban centers, particularly in Karachi and Lahore, the gay rights movement has found expression through online activity, such as through the Pakistan Forum for Gender and Sexual Minorities. Women's rights and feminist organizations and grassroots movements have a sustained history of engaging with and occasionally supporting multiple and diverse sexes and sexualities.

Marriage

In Pakistan, 50.71 percent of the population is male, and 24.48 percent have never been married. Likewise, 49.29 percent of the population is female, and 18.88 percent have never been married.

Polygamy is permitted by Islamic law and widely practiced. Divorce laws are theoretically equal and free, but women tend not to work (at least not in a formalized, wage-earning capacity) after marriage, as they are expected to devote themselves to domestic duties. They are frequently financially dependent on their husbands, making it difficult to leave an unpleasant or abusive situation.

Notions of honor, shame, and pride also play a part: stories collected by women's organizations, editors, and activists from Balochistan, Sindh, KPK, as well as urban centers such as Lahore and Karachi, demonstrate that the "respectability" of a family often depends on the silent endurance of their daughter. Adultery, even disobedience

or assertions of individuality, are considered provocative, even immoral, by communities that adhere to dogmatic, traditionalist interpretations of Islamic doctrine; punishments vary from sexual neglect, to physical abuse, to whipping and acid burning.

Reproduction

A woman in Pakistan, on average, has 4.9 children. Because polygamy is common practice in accordance with Islamic law, households often consist of 10 or more children. Urban women are more likely to have fewer children and better access to prenatal and postnatal care. However, women's control over motherhood is limited by social structures that prioritize their domestic functions over professional ones.

Historical ideological shifts have tended to focus on women's bodies as sites of contention and control, and less-secular policies have tended to reject birth control as immoral. Girl children, however, are subject to sex-selective abortion: in 2014, 105.7 boys were born per 100 girls, and 116,384 female fetuses were aborted based on their gender. According to statistics provided by the Edhi Foundation, Pakistan's largest nongovernmental welfare agency, female infanticide (propelled by a growing population of urban poor) has been on the rise in Pakistan since 2011.

Sex Education, Contraception, and Abortion

Access to sex education, contraception, and abortion varies widely with region, class, and economic and financial circumstances. Programs such as the one launched by Shadabad Elementary School for Girls in Pir Mashaikh, Johi (Sindh province)—which has begun conducting classes for girls to explain puberty, gynecological biological functions, and "preventative measures" to protect them from sexual abuse or harassment—are rare. Information about sex and reproduction, as well as abuse, rights, and legal recourse, overwhelmingly comes from female relatives in rural areas (particularly Khyber Pakhtunkhwa, Punjab, and Baluchistan); television serials in urban areas (particularly Sindh, Punjab, and Baluchistan); and television news in urban Sindh. Statistics collected by the Shirkat Gah Women's Resource Centre are striking, in part because interviewed women report that they also acquire information from newspapers and magazines, male relatives, and radio broadcasts.

Abortion to protect the life of a pregnant woman is legal in Pakistan, but regulations regarding termination of

unwanted pregnancies vary. According to the Guttmacher Institute, 200,000 women are hospitalized in Pakistan each year due to complications resulting from nonmedically supported abortions.

Politics

Pakistan practices universal suffrage: each citizen has the right to vote in local, provincial, and national elections. However, panchayats and jirgas often operate based on nomination and social influence. Vulnerable members of society—women and persons discriminated against on the basis of ethnicity, religion, or sexual identity—are exposed to intimidation, violence, and silencing and have little practical recourse.

Political Participation

According to research conducted by the Shirkat Gah Foundation, female membership in formalized political parties declined steadily and plateaued at single digits, or lower, through the 1980s and 1990s. Women's wings of political parties, segregated from male memberships by implicit if not explicit regulation, functioned "largely as a means of mobilizing women for purposes of voting and demonstration" (Shaheed 2002, 30). Parties without specifically female wings began to address women's issues (being otherwise raised only by radical feminist, occasionally socialist/Marxist feminist, grassroots organizations) in the 2000s after extensive and sustained lobbying efforts from civil society movements.

Between 2000 and 2004, the Women's Political Participation Project, in collaboration with organizations such as the Aurat Foundation based in Karachi and Lahore, trained women councillors newly elected to office under the aegis of increased reservation for women: 33 percent of local government positions and 17.5 percent of provincial and national assembly seats were filled by women. According to Saigol, this type of training, or reeducation, neutralized what might otherwise have been a feminist lobby. The peasants' and land rights struggles led by the Anjuman-e-Mazreen had huge implications for, and consisted of, Punjabi women without state- or societally sanctioned privilege to draw on, and precisely that segment of the population is best served by women representatives in government. Neither they, nor the WID-oriented NGOs, challenged Musharraf's quell of the incipient movement. Afiya Zia has pointed out that feminist movements in

Pakistan have more often been spurred by dictatorial regimes.

Women's Rights

Major laws that make up a bulk of the humanitarian discourses, and continue to have a direct bearing on women's rights and well-being in Pakistan, include the following: Guardians and Wards Act (1890), the Foreign Marriage Act (1903), the Child Marriage Restraint Act (1929), the Dissolution of Muslim Marriage Act (1939), the Muslim Family Law Ordinances (1961), the West Pakistan Rules under the Muslim Family Laws Ordinance (1961), the West Pakistan Family Court Act (1964), the West Pakistan Family Court Rules (1965), the Dowry and Bridal Gifts (Restriction) Act (1976), the Dowry and Bridal Gifts (Restriction) Rules (1976), the Hudood Ordinances (1979), the Qanun-i-Shahadat Order (1984), the Pakistan Citizenship Act (1951; amended in 2001), Amendments in Family Courts Act for Khula, etc. (2002), the Protection of Women (Criminal Laws Amendment) Act (2006; barred by the CII as of 2011), the Criminal Laws (Amendment) Act on sexual harassment (2010), the Protection against Harassment of Women in the Workplace Act (2010), the Prevention of Anti-Women Practices (Criminal Laws Amendment) Act (2011), the Acid Control and Acid Crimes Prevention Act (2010), the Women in Distress and Detention Fund (Amendment) Act (2011), the Domestic Violence (Prevention and Protection) Act (2012), the Anti-Rape Bill (2014), and the Anti-Honor Killings Laws (Criminal Laws Amendment) Bill (2014).

Religious and Cultural Roles

Women in Pakistan routinely labor under the dual burden of fulfilling their patriarchally prioritized function as reproductive subjects and acting as sexually fetishized objects of devotion and contempt. It is a position often accorded, reserved for, or forced upon the female or the feminine by dogmatic and conservative interpretations of Abrahamic as well as Indic religions practiced worldwide. Women are systematically subordinated and often relegated to the *chardiwari*, or "four walls" of a domestic household, as well as to metaphorical, symbolic, and actual invisibility.

According to Deniz Kandiyoti (2016), the overlapping of cultural violence against women with religion in Pakistan has a complex history. The All-India Muslim League's

strategy of framing women's participation in the movement for an independent Pakistan as a religious duty through the early 20th century set a precedent for theocratic thinkers to abuse notions of Islamic morality for political ends in later years, with particularly dire consequences for women and minorities. Similarly, Zulfikar Ali Bhutto's progressive and populist position was maintained through intimidation: in a classic instance of arguing that the ends justify the means, Zulfikar's power base reportedly kept dissidents in line by using sensationalized figurations of transgressive women. These women were often dependent on men who had violated a vague amalgam of social, political, and religious order, and the women were forced into prostitution in the Gulf States. The pattern of drawing upon fears of contamination ("Pakistan" literally means "land of the pure") as well as strategically fueling the objectification of women by associating the value of their vote with the benefit of virtue have created an ideal of a female citizen, which makes her indivisible from physical resource—possessable, transferable, and subject to control and ownership.

Issues

Advocacy Groups

Advocacy groups such as Tabassum Adnan's Mingora village-based Khwendo Jirga offer some alternatives for women who need legal help. Adnan's Jirga is a female-run council that challenges the traditionally male prerogative of communal justice and offers women a forum to which they might bring domestic as well as broader grievances and concerns.

Student and youth groups, such as the Karachi-based Girls at Dhabas, have harnessed social media platforms to trigger dialogue and increase their own and their readers' engagement with public life—or the constraints thereof. With wide-ranging, diverse participant pools and readerships, these incipient, originally anecdotal would-be movements have immense amorphous potential, but their ultimate efficacy over time remains to be measured.

The viral hashtag #TryBeatingMeLightly featured young professional women's response to the Council of Islamic Ideology's (CII) proposed riposte to the 2016 Punjab Protection of Women against Violence Act, which includes provisions for safeguarding the physical welfare of a woman whose abuse complaint has been verified by the court. The CII deemed said provisions un-Islamic and unconstitutional; their alternative mandated that a

husband may ignore an offending wife, refuse to share her bed, refuse her food, and, in exceptional circumstances or if her conduct failed to improve, beat her "lightly." While young middle-class women from Sindh and Punjab (as well as members of the Pakistani diaspora) retweeted and shared photographer Fahhad Rajper's images by the thousands, the "trend" petered off without engaging with the political process. It is perhaps most accurately described as an aesthetic, if politically inspired, exercise, an anomaly.

Energy, Environment, and Climate Change

According to the Pakistan Alternative Energy Development Board, 18 percent of (mostly urban) households in Pakistan have access to natural gas, and more than 80 percent of the rural population relies on biomass. Only 45 percent of Pakistanis have access to clean fuel. The National Rural Support Programme launched a pilot biogas program in Punjab in collaboration with the Netherlands Embassy in Pakistan, Winrock International, and SNV (both Dutch NGOs) to explore ways to address energy needs.

WHO's 2015 report indicated that 0.4 percent of the population dies as a result of natural disasters. Pakistan ratified the Paris Agreement on climate change in April 2016.

Human Trafficking, Displacement, and Migration

Pakistan has a long history of dealing (not very effectively) with refugees, migrants, and displaced persons. During the Afghan-Soviet war, as well as during times of increased radical Islamist activity in Afghanistan, persons fleeing persecution have found their way into the country. Pakistani citizens facing destitution often migrate to Gulf States or Europe in search of low-skilled employment; people from Bangladesh and Afghanistan, as well as Sri Lanka, immigrate to Pakistan for the same reason. Some of them are conned by trafficking concerns. Borders with India as far less porous: with the exception of occasional efforts to run symbolic bus services across the two Punjab, the neighbors have refused to receive nondiplomatic migrants and discouraged tourism.

The Partition of British India in 1947, of course, accompanied large-scale exoduses on both sides as well as a great deal of bloodshed. Likewise, during the Bangladesh Liberation war, refugees from East Pakistan found their way west.

Of greatest concern, however, is Pakistan's status as a significant "source, transit, and destination country" for human trafficking; the U.S. State Department now

categorizes it as a Tier 2 purveyor of trafficked people. The agriculture, brickmaking, fishery, carpet-making, and mining industries employ bonded, usually unwaged, laborers; women and children are also trafficked for domestic servitude and sexual exploitation. The use of children, who are often maimed, in begging rings is widespread; girls are often sold into one or another form of “forced marriage” in Pakistan, Iran, Afghanistan, or the West.

Though Pakistan has laws designed to counter this activity, the report suggests that the absence of procedural and legal implementation has two main causes: bribery and corruption (law enforcement officials are paid to look away), institutionalized disregard for the victims (particularly rooted in misogynistic, culturally and politically endorsed frameworks that legitimize the use and abuse of women). The Pakistani Federal Investigative Agency’s research and analysis efforts are acknowledged by the State Department report, but found wanting. The efforts establish protective and care services for victims of trafficking and aim to prevent the prosecution of trafficked people for visa and migration regulation violations, as well as any other offenses they may have been forced to commit during the course of their ordeal. However, persistent abuse by government officials of their position to facilitate trafficking for profit and the persistent conflation of migrant smuggling and human trafficking are seen as serious hindrances to the effective implementation of the Prevention and Control of Human Trafficking Ordinance (PACHTO).

Philippines

Overview of Country

The Republic of the Philippines is an archipelago (a group of islands) between the Philippine Sea and the South China Sea. It lies east of Vietnam, south of Taiwan, and north of Malaysia and Indonesia. The archipelago is made up of 7,107 islands, with only 3,144 named islands. The country is roughly 115,000 square miles (298,170 sq. km) and has a mountainous topography as well as coastal lowlands. Its climate is tropical marine with northeast and southeast monsoons. The wet season runs from June until November and is characterized by rain showers, and the dry season runs from December to May (National Statistics Office 2014). The Philippines is near a typhoon belt and is struck by five to six cyclone storms each year. It is also subject to landslides, active volcanoes, and tsunamis (CIA 2013). As of 2012, the population of the Philippines was 96.7 million (UNICEF 2013).

The country is divided into 17 regions that are further divided into 80 provinces. The provinces are divided into

143 cities and 1,491 municipalities. The municipalities and cities are then divided into *barangays* (National Statistics Office 2014). A *barangay* is a unit of administration in the Philippines that consists of a headman with 50–100 families underneath him (Merriam-Webster 2015).

The Philippines has a history of being under Spanish colonial rule. Ferdinand Magellan entered the Philippines on March 16, 1521, and 300 years of Spanish colonial rule followed. The Philippines was named after the Spanish ruler, King Philip. Following the Spanish-American War, Spain was defeated and ceded the Philippines to the United States under the Treaty of Paris in 1898. The Filipino people attempted to become sovereign and fought the Americans in the Filipino-American War from 1899 to 1902, but they lost. In 1934, the Philippines was recognized as a Commonwealth of the United States. When World War II began, the Japanese invaded the Philippines and occupied the country from 1942 to 1944. The Filipino people achieved their independence from the Japanese in 1946 and remained independent until 1972.

In 1986, President Ferdinand Marcos was overthrown by the People Power Revolution, and Corazon C. Aquino became president, followed by Fidel V. Ramos in 1992. In 1998, President Estrada was elected the 13th president of the republic, but in 2001, he was overthrown by another People Power Revolution. In 2004, Vice President Gloria Macapagal Arroyo became president; she survived several coups attempts before her term ended in 2010. Benigno Simeon C. Aquino III became president of the Republic in 2010, and Rodrigo Duterte was elected president in 2016 (National Statistics Office 2014). Duterte, former mayor of Davao City for two decades, campaigned to kill criminals and drug dealers as an anti-crime measure (The Guardian 2016; Villamor 2017).

The government in the Philippines follows a 1987 constitution similar to that of the United States. Its government consists of the executive, legislative, and judicial branches. The president is limited to a six-year term. The executive branch consists of the president, a vice president, and a cabinet, and the legislative branch consists of Congress. The judicial branch includes the Supreme Court (National Statistics Office 2014). However, the Philippines elects the president and vice president separately. Citizens vote for a presidential candidate and an unpaired vice presidential candidate. Because of this system, a president and a vice president in the Philippines can be from two different political parties (Silvestre 2001). For the most part, however, the government is structured similarly to the U.S.

government due to the influence of the United States from 1898 until the Japanese occupation in 1942.

The ethnic groups in the Philippines are Tagalog (28.1%), Cebuano (13.1%), Ilocano (9%), Bisaya/Binisaya (7.6%), Hiligaynon Ilonggo (7.5%), Bikol (6%), Waray (3.4%), and others (25.3%). The capital city of the Philippines is Manila, which has about 12.946 million inhabitants (CIA 2013). The Philippines' other main cities include Davao (1.63 million), Cebu City (951,000), and Zamboanga (936,000). Forty-four percent of the population is urban (Worldometers 2015).

In 2015, the UN Development Programme (UNDP) ranked the Philippines 115th out of 188 nations based on the Gender Inequality Index (GII), with a score of 0.42 on a scale of 0–1 (UNDP 2015). GII measures the loss in potential human development due to disparity between female and male achievements on empowerment and economic status. A higher GII value indicates a higher level of inequality. Factors included in the calculation of GII are the maternal mortality ratio, adolescent birth rates, educational attainment statistics, representation in the Inter-Parliamentary Union (IPU), and women's labor market participation. The Philippines score is compared to normative ideals for women's health. The Philippines GII score is considered "medium human development" on a scale from "low human development" to "high human development" (UNDP 2015).

Girls and Teens

Family Role and Recreation

There appears to be no single definition as to what identifies a young woman as a Filipino "adolescent." Interestingly, most government and nongovernment parameters seem to include ages 15–24 and then span across 13–30 years old (Cabigon 2009, 110). Young adults are likely to continue living in their parents' home, and married couples often continue living with one of the spouse's parents. This is due to a cultural norm valuing the family system, but it can also provide economic benefits (Cruz, Laguna, and Raymundo 2011).

The family serves as the primary social group for Filipinos. The role of mass media, perhaps particularly Western media, has reshaped the adolescent experience. Single, female, urban residents between the ages of 15 and 19 are reported as the biggest consumers of mass media.

The Youth Adult Fertility Study (YAFS) was the first nationally representative sample of adolescents between

the ages of 15 and 24, and it reported the endorsement of distal-risk, proximal-risk, and risk behaviors. Distal-risk behaviors were described as going to parties, discos, excursion and picnics, sport activities, movie theaters, and fraternity and sorority activities. Forty-three percent of adolescents reported participating in one or more of these distal-risk activities. In the YAFS, distal-risk behaviors were suggested as healthy social outlets that likely served as fertile ground for more extreme risk behaviors.

Proximal-risk behaviors included visiting massage parlors, spending the night out with friends, going to strip shows and nightclubs, and visiting beer houses. Eighteen percent of females reported no participation in proximal-risk behaviors, 66.8 percent reported moderate participation, and 15.1 percent reported high participation. Finally, risk behaviors were defined as smoking, drinking, drug use, commercial sex, and premarital sex. The study showed that 16.5 percent of females reported having smoked (5.1% currently smoke), 36.5 percent reported trying alcohol (0.7% currently drink), 1 percent reported trying drugs, and 26.6 percent reported having premarital sex (Cruz, Laguna, and Raymundo 2011, 21).

Sexual Activity

Early sexual initiation is defined as beginning sexual activity before age 18. In 2013, 22 percent of female youth in the Philippines reported early sexual initiation, an increase from 12 percent in 1994 (Demographic Research and Development Foundation 2013). Casual sex reported among girls in the Philippines is lower than that of males, with 0.7 percent of girls reporting engaging in casual sex, whereas 9.4 percent of males reported engaging in casual sex. Of the women who engaged in premarital sex, 83.8 percent reported not using any form of birth control during the initial encounter (Philippine Statistics Authority and ICF International 2014). The country is largely Roman Catholic, which may speak to the low percentage of females who engage in casual sex. This may also account for the lower use of birth control during sexual encounters. Lower use of birth control could also be due to lack of access or other extraneous factors.

Discussions about sex education are very limited; only 17.6 percent of female adolescents ever discuss sex at home (Cruz, Laguna, and Raymundo 2011, 5). Most females receive information regarding sexual experiences from a female friend (53%). As in other countries, this can lead to a dissemination of misguided information.

Media and Sex

Media exposure plays a role on how women view themselves, interact with others, and receive messages from society. Women and girls in the Philippines have access to information through a variety of media forms. Eighty percent of women own a cell phone, and 61 percent report using the Internet. Fifty-six percent report using a social networking site, and 55 percent report having an e-mail account. While women have access to media, only 5.1 percent report visiting Web sites with sexually explicit content, compared to 26.4 percent of men reporting visiting such sites. Ten percent of women report sending or receiving sex videos through their cell phone or the Internet (Philippine Statistics Authority 2013). Women and girls in the Philippines appear to have access to various forms of media, but they do not engage in sexual behavior through media at the same frequency as men in the Philippines or possibly girls and women within other contexts.

Education

Primary and Secondary Education

The literacy rate for females ages 15–24 in 2008–2012 was 98.5 percent, and for males of the same age, it was 97 percent (UNICEF 2013). There does not appear to be a discrepancy between males' and female' access to literature or reading level. Girls' rates for literacy are similar to males' because they attend school at a similar rate to males. Social factors on girls do not seem to affect literacy rates in the Philippines.

Like literacy, there does not appear to be a gender difference regarding access to and attendance in school. The expected number of years of schooling a child can expect is 11.5 years for females and 11.1 years for males (UNDP 2015). There does not appear to be a discrepancy between the number of years that men and women stay enrolled in school. Fifty-one percent of females enroll in preprimary school. The primary school enrollment rate is 89.5 percent for girls, but only about 66 percent of girls enroll in secondary education (UNICEF 2013). Sixty-seven percent of students in secondary education are female (UNICEF 2013). The presence of the United States in the Philippines may address why the rates for females in education are similar to that of the United States.

College and Technical School

Women in the Philippines attend college at a slightly higher rate than men in the Philippines. Around 22.7 percent of

women attend college compared to 18.1 percent of men, and around 21 million women are enrolled in college compared to 18.1 million men. The most common major among Filipino college-aged women is business administration. This choice in major may speak to the increased salary later in life. While some women attend college, others attend vocational school or receive technical training. Men and women in the Philippines have similar rates of attendance in Technical Vocational Education and Training (TVET). Around 216,303 women and 115,550 men attend technical school annually. In 2014, 929,960 women graduated from TVET in the Philippines. The most common TVET degrees for women in 2013 were health and social services and community development services (Philippine Statistics Authority 2013).

Health

Life Expectancy

Women in the Philippines live 71.8 years on average, whereas men live 64.9 years on average (Philippine Statistics Authority and ICF International 2014). Males may not live as long as women due to a variety of biological, social, and psychological factors, such as an increased suicide rate among males.

Access to Health Care

Access to health care remains a concern in the Philippines. The Philippines has approximately 1,800 hospitals and 98,100 beds. In 2012, only four regions of the Philippines were equipped with an adequate number of beds per 1,000 individuals, per the Philippines Department of Health. In 2013, only 63 percent of Filipinos had health insurance, an increase from 42 percent in the previous five years. Men and women were equally likely to have health insurance. Ten percent of the population reported receiving treatment within a 30-day period, and women were 3 percent more likely to have received treatment than men. During this period, the average cost of treatment for a single outpatient visit was 455 Philippine pesos (PHP) in a public facility and 2,268 PHP in a private facility. However, the average cost of medication was 4,663 PHP (Philippine Statistics Authority and ICF International 2014).

Economic class impacts access to health care. Pregnant women in the lowest economic class are underserved and have the greatest need for health care. In 2011, the Philippine government recognized an inequality in access to

health care and put into action *Kalusugan Pangkalahatan*, or achieving universal health care (Romualdez et al. 2011). Access to vital medications is one large area of concern. Only 25 percent of public facilities, and less for individuals, have access to such medications. Costs of medications and counterfeited medications exacerbate this access shortage (WPRO 2016). When making decisions regarding health care, 52 percent of women report making their own decisions, regardless of marital status (Philippine Statistics Authority and ICF International 2014).

There are 46 outpatient facilities for mental health care in the Philippines' larger cities. There are 15 community residential facilities with about 1,457 beds total (WHO 2011). Access to psychiatrists is greater in the mental health clinics than in the public sector. In the public sector, there are 0.41 psychiatrists per 100,000 Filipinos. In mental health clinics, there are 3.21 psychiatrists per 100,000 Filipinos (WHO, and Department of Health, Philippines 2007). The lack of mental health professionals contributes to the limited access of care. Additional barriers, such as cost for treatment, also prevent individuals from seeking treatment. Like many countries, there is a stigma in the Philippines associated with mental health and mental health treatment. Because the cause of mental illness is believed to be a lack of ability to adapt to the current situation, a weak spirit, or the consequences of past behavior or past ancestral behavior, ridicule is expected for the individual seeking treatment. Furthermore, problems that might be classified as mental illness are treated in other regards, such as support from family and friends, indigenous healers, or through religious practice (Sanchez and Gaw 2007).

Diseases and Disorders

There is a high risk for food- or waterborne diseases such as bacterial diarrhea, hepatitis A, and typhoid fever. Dengue fever, malaria, and leptospirosis are also present in the Philippines (CIA 2013). Additionally, the Philippines has one of the highest rates of tuberculosis (TB) in the world, which is the sixth-leading cause of mortality for the nation. Males experience TB at rates roughly twice that of females (Vianzon et al. 2013). Malnutrition is a concern in the Philippines. In 1987, it was reported that 2.8 percent of preschoolers were experiencing severe malnutrition, below 60 percent of desired body weight for age and sex (Dolan 1993). Between the years of 2008 and 2012, 7 percent of the overall population experienced severe malnutrition

(UNICEF 2013). The Philippines' Department of Health reported the following as the top 10 leading causes of mortality among females in 2013, in order: heart disease, diseases of the vascular system, malignant neoplasms, pneumonia, diabetes mellitus, accidents, chronic lower respiratory diseases, tuberculosis, nephritis, and certain conditions originating in the birthing period (Timbang et al. 2014).

Mental Illness

Filipinos historically believed mental illness was caused by inanimate objects or supernatural phenomena, and conditions were treated by faith healers using purification and exorcism. A shift of conceptualizing mental illness was seen during the introduction of the Spanish rule. During this period, Jose Rizal wrote the novel *Noli Me Tangere* (*Touch Me Not*), in which he depicted a deranged woman who cannot protect her two sons from the abuse of their father. This woman, Sisa, has become the national symbol for mental health in the Philippines. Her story is described as one of a typical woman during the Spanish reign. At this time, and for periods following, insanity was believed to be the result of a person's inability to face reality or handle life's pressures.

The first mental health hospital opened in November of 1904 under the Bureau of Health and started the mental health practices of the Philippines that are seen today (Philippine Psychiatric Association 2016). A statue of Sisa and her two children welcomes patients to receive care at the National Center for Mental Health. Therapy treatments have been influenced by the different national occupancies and will mimic treatments of these countries during the corresponding time frame (e.g., the United States and Japanese). A specific mental disorder called *silok* is experienced by Filipino women and has also been reported within other Asian countries. This disorder presents as a hypersensitivity to fright accompanied with repetitive behaviors and speech and a trancelike demeanor (American Psychiatric Association 2000).

In the Philippines, females have a much lower rate of suicide than males. In 2015, the suicide rate was 1.2 per 100,000 females and 4.8 per 100,000 males (UNDP 2015). Women in the Philippines may have certain protective factors that males in the Philippines do not. Of the persons treated in outpatient mental health facilities in 2011, 43 percent were female. Of persons staying in community residential facilities in 2011, 30 percent were female (WHO 2011).

Sexual Health

In 2014, 0.06 percent of the population (35,600 people) in the Philippines were living with AIDS (CIA 2013). Of those, around 2,200 are women. About 18.7 percent of female adolescents disclose that they have a comprehensive knowledge of HIV (UNICEF 2013). Around 80 percent of females disclose that they do not use protection the first time they are sexually active.

Childbirth and Maternal Health

In the Philippines, the mean age of a woman's first birth is 23 years old. The fertility rate is about 3.09 children born per childbearing woman (CIA 2013). Of the births per year, 46.8 percent are considered "teen births" (born to women ages 15–19). A majority of women in the Philippines receive at least four visits of antenatal care. Of women who are pregnant, 9 percent received at least one antenatal visit, and 77 percent received at least four visits. There appears to be a discrepancy in the presence of skilled birthing attendants in rural versus urban settings. Seventy-seven percent of births in an urban area had a skilled attendant at the birth, compared to 47 percent of births in rural areas. Many births occurred in an institutional or hospital setting (44%), but the majority do not. A small minority, 9.5 percent, of babies are born via cesarean section (UNICEF 2013). Fertility rates for women differ among income levels. Those in the highest 25 percent have two children on average, and those in the lowest 25 percent birth an average of five children (Romualdez et al. 2011).

Breastfeeding

Mothers in the Philippines reported breastfeeding their children as well as introducing solid and soft foods. Thirty-four percent of mothers report breastfeeding exclusively while their child was under six months of age. By the time their child turned two years old, 34 percent of mothers reported continued breastfeeding. However, the majority of mothers (90%) introduced solid, semisolid, or soft foods between the ages of six and eight months (UNICEF 2013).

Mortality among Infants, Children, and Mothers

The infant mortality rate in 2015 was 23.5 per 1,000 live births (UNDP 2015). It is estimated that the maternal mortality rate is 114 deaths per 100,000 live births (CIA 2013). The under-5 mortality rate for children is 29.9 per 1,000 live births (UNDP 2015). Twenty-one percent of babies

have a low birth weight (UNICEF 2013). Twenty-two percent of babies are moderately or severely underweight. The life expectancy of females as a percentage of males in 2012 was 110.5. The reported maternal mortality ratio between 2008 and 2012 was 160. The life expectancy at birth is 68.5 years (UNICEF 2013).

Employment

Workforce

The workforce is composed of 51.1 percent of females 15 years and older, compared to 79.7 percent for males (UNDP 2015). Women and men do not experience different rates of unemployment. Both men and women in the Philippines have an unemployment rate of 5.2–5.9 percent. While women attend college in higher numbers than men, the primary occupation for both men and women in the Philippines is as a laborer or in an unskilled work position (Philippine Statistics Authority 2015).

Women and the Economy

The Philippines has been ranked 7th out of 145 countries in the *Global Gender Gap Report* from the World Economic Forum (WEF 2015). The Gender Gap Index ranks countries on a scale of 0–1.00. The Philippines has a score of 0.790. The scores are composed of economic participation and opportunity, educational attainment, health and survival, and political empowerment. The Philippines ranks 16th for economic participation and opportunity, which includes components such as women in legislative positions as well as women as professionals and technical workers. The Philippines ranks 34th for educational attainment. This includes factors such as the literacy rate and enrollment in primary through tertiary education. For political empowerment, the Philippines ranks 17th, which includes women in parliament and years with a female head of state. Most notably, the Philippines ranks 1st on health and survival. The sex ratio at birth and healthy life expectancy in the Philippines is ranked the best globally. Since the beginning of the Gender Gap Index in 2006, the Philippines has been number one every year in health rankings. The Philippines was number one in education from 2006 to 2014, but its ranking fell to 34th in 2015 (WEF 2015).

Maternity Leave

In the Philippines, women get 60 days of paid maternity leave benefits through the Filipino government. Female

workers receive 100 percent of their wages while on maternity leave. Males in the Philippines receive 7 calendar days of paternity leave through their employers, and receive 100 percent of wages while on leave (WEF 2015).

Income

Women in the Philippines have a higher average income and higher average annual savings than males. The average annual income of women heads of household is 258,000 Philippine pesos (PHP), which is about USD\$5,500 (Philippine Statistics Authority 2014). Male heads of household have an average annual income of 228,000 PHP, which is about USD\$4,900. Women in the Philippines also report saving more money annually than men in the Philippines. Women in the Philippines report saving 51,000 PHP (USD\$1,100), whereas men report saving 39,000 PHP (USD\$846) (Philippine Statistics Authority 2014). Women in the Philippines report a higher income, which may be due to higher participation in tertiary education and higher rates of college degrees.

The annual earnings discrepancy may also be due to the type of work that men and women do in the Philippines or the types of degrees they obtain. Twenty-eight percent of men work in industries such as mining and construction. Twenty-two percent of men are in agriculture or fishing. The other half (49.7%) work in the service industry (National Statistics Office 2013). The majority of females in the workforce are in the service industry (78.4%). Only 8.7 percent of women are in agriculture, and 13 percent are in industry (e.g., mining, construction) (National Statistics Office 2013). The service industry could pay more than agriculture and industry. The discrepancy is not fully explained.

Labor Export

Labor export, or nonpermanent overseas employment, continues to grow as a means to financially support one's family. The Philippines is one of the largest sources of female labor export (Parrenas 2001). The Philippine Overseas Employment Administration (POEA) was developed in the 1970s, and in 2014, it reported that 2,391,152 workers have overseas employment contracts (POEA 2014). Top destinations include Saudi Arabia, the United Arab Emirates (UAE), Singapore, Qatar, and Hong Kong. Top occupational categories include household services, nurses, waiters and related workers, caregivers, and laborers. Roughly 55 percent of the labor export is made up of

women who are predominantly working in service positions (e.g., caregiver, housekeeping).

It might be expected that the physical removal of mothers from the home—in addition to the higher income contribution—would impact traditional gender roles. However, this is typically not the case, as other women (e.g., daughters, grandmothers) take on the remaining domestic duties (Parrenas 2005). Labor export often results in the separation of mothers and their children. Approximately 27 percent of the youth population in the Philippines will be apart from one or both parents as a result of labor export (Parrenas 2005, 317). This *transnational motherhood* has been described as a process that “ruptures the ideological foundation of the Filipino family” (Parrenas 2001, 361). Some scholars argue such separation causes feelings of helplessness, loneliness, insecurity, loss of intimacy, and guilt for mothers. Filipinas experience what is believed to be a binary decision between providing for their children financially abroad or emotionally nearby (Parrenas, 2001). The economic gains earned from export laborers are often sent back to immediate family to help pay for a more secure lifestyle. With the higher wages, these Filipina export laborers are able to finance domestic help, housing, education, land, and possibly savings. This middle-class lifestyle is a stark contrast to the Third World life of poverty from which the women may have originated (Parrenas 2001).

The reality of violence and sexual abuse in the labor export of Filipinas has been exposed. Not only through sex trafficking and “mail-order brides,” but within any position abroad, Filipina women risk sexual assault and abuse. Furthermore, those who experience sexual violence are often not supported by the local law enforcement, and they are often blocked from embassies, making it ineffective to report such crimes (Piper 2003).

Family Life

Family Structure

The nuclear family plays an important role in the life of a Filipino woman. There is a strong allegiance to family members and their well-being. The familial role of the Filipino woman is complex and at times contradictory. As a strong contributor to the household income, the female may experience greater equality than she would in other Asian countries. Eighteen percent of women reported owning land, and 33 percent of women reported owning a home, either alone or jointly (Philippine Statistics Authority and ICF International 2014). Women also take on the responsibility

of managing the family income, which is said to “give her the power of the purse” (Dolan 1993). As in other traditional Asian countries, women are expected to manage or perform daily household tasks. Of the population over the age of 10, 45.3 percent were married, and 1.2 percent were divorced (Philippines Commission of Women 2014).

The Filipino language demonstrates the distinction and hierarchy of roles within the family. Women are given the following titles signifying their age: *ate* (eldest sister), *ditse* (second-eldest sister), *sanse* (third-eldest sister), and *lola* (elder family member, similar to grandmother). *Ate* and *lola* are also used as terms of endearment for elder nonfamilial women. Similar terms are used for male counterparts. The importance of the elderly is apparent and helps to identify the head of the nuclear family, which can be filled by a man or woman. Expected norms are determined by the head of the family, and breaking such norms can lead to ostracism (Torres 1985). The rate of female-headed households has steadily increased from 10 percent in 1970 to 21.2 percent in 2009 (Philippines Commission of Women 2014).

Reproduction

The Responsible Parenthood and Reproductive Health Act of 2012 was made into law in the Philippines and covered topics such as contraception, sexual education, and maternal care. The law declared that the state “recognizes and guarantees the exercise of the universal basic human right to reproductive health by all persons, particularly parents, couples and women, consistent with their religious convictions, cultural beliefs and the demands of responsible parenthood.” Abortion is illegal in the Philippines, but the act states that women needing care after an abortion would be treated in a humane and compassionate manner. Also, the act states that there would not be a target or required growth rate of the population and that the focus would be on reproductive health and sustainable human development (Responsible Parenthood and Reproductive Health Act of 2012). Proponents of the bill believed that it would improve the lives of women and children in the Philippines and provide more humane care. Opponents of the bill argued that the government declaration of contraceptive use went against the majority Catholic beliefs.

Politics

Representation in Government

Of the elected positions in the Philippines, women are represented in leadership about 20 percent of the time

(Philippine Statistics Authority 2013). Men hold 80 percent of the public roles, such as president, vice president, senator, congressmen, governors, and mayors. This is slightly higher than the 19 percent global rate of women parliamentarians (UNDP 2016). While women only hold 20 percent of the elected government positions, the number of women in public office is rising. In 1998, there were 2,810 women in office. As of 2013, there were 3,580 women in office (Philippine Statistics Authority 2014).

Women in the Philippines are slowly rising into positions of power in the Filipino local and national governments. Most notably, the Philippines has had two female presidents Corazon Aquino and Gloria Macapagal-Arroyo. Corazon Aquino was the wife of Benigno “Ninoy” Aquino, who was a political figure known for exposing the corruption of Ferdinand Marcos, the president in 1986 (Silvestre 2001). Corazon Aquino ran against the man who had her husband killed and won the support of the Catholic Church, the religious majority in the Philippines. Aquino’s campaign focused on her role as a “housewife” as well as being the widow of a political leader and a religious woman. This suggested to the people that she was not another corrupt politician.

Gloria Macapagal-Arroyo became the second female president; she had a different path to power than Aquino. Macapagal-Arroyo had political experience as a senator and was the daughter of a former president of the Philippines. She was elected vice president in 1998 with 13 million votes, the largest mandate in history (Silvestre 2001). When President Estrada was impeached and resigned, Macapagal-Arroyo became president. Furthermore, as of 2010, 34 percent of incumbent judges in the first and second level courts were female. During this same period, 21 percent of Supreme Court justices were female. However, trends have shown a decrease of female representation in the high courts (Philippine Commission on Women 2013).

Voter Turnout

National voter trends suggest 24 percent of women are registered to vote, and 18 percent of women participate by voting in national elections. The rate of voter turnout is slightly higher for women than it is for men (Philippine Commission on Women 2013).

Feminist Movement and Advocacy

The feminist movement of the Philippines is described as a grassroots-based organization that demands social

justice, equality, freedom, and democracy for Filipinas. Beginning in 1984, GABRIELA (General Assembly Binding Women for Reforms, Integrity, Equality, Leadership, and Action) was formed in the spirit of Gabriela Silang, a female general during the Filipino revolution from Spain (Gabriela Women’s Party 2016). During the 1980s, Filipinas experienced high levels of political and economic distress and saw a need to form a coalition to unite women. The GABRIELA movement has expanded internationally to align over 250 organizations, including a U.S. chapter (Gabriela USA 2016). GABRIELA has identified “seven deadly sins against women” as part of Voices of Women vs. Violence against Women: (1) sex trafficking and prostitution; (2) domestic violence; (3) rape, incest, and sexual abuse; (4) sexual harassment; (5) violence as a result of political repression; (6) sexual discrimination and exploitation; and (7) limited access to reproductive health care (UN Entity for Gender Equality and the Empowerment of Women 2002).

In 2000, the Gabriela Women’s Party was formed as a by-product of the GABRIELA movement. This political party identified as an alliance of Filipino women at the forefront for freedom and democracy (Philippine Commission on Women 2013). With more than 100,000 members, the Gabriela Women’s Party ranks fourth of 66 groups in elected representatives. The Gabriela Women’s Party has found success in helping to pass the Anti-Trafficking Persons Act, the Anti-Violence against Women and Children Act, and smaller legislation such as HR 1523: Merchandise That Commodify and Degrade Women (Gabriela Women’s Party 2016).

In 1988, President Corazon C. Aquino passed proclamation No. 227, observing the month of March as Women’s Role in History Month. The proclamation exclaimed, “Filipino women of every class, ethnic, and religious background served as leaders in the forefront of every major progressive social change movement, not only to secure their own right of suffrage and equal opportunity, but also to create a more fair and just society for all” (Philippine Commission on Women 2009).

The Philippine Commission on Women is now recognized as the official government authority on women’s empowerment and gender equality. This organization works to repeal discriminatory laws, support the gender balance of political representation, address environmental concerns, eliminate violence against women, and provide economic empowerment, all in the spirit of promoting gender equality.

Religious and Cultural Roles

Religion intersects with many areas of life in the Philippines. The primary religion in the Philippines is Catholic; 80.9 percent of people practice Roman Catholicism, and 2 percent practice *Aglipayan Catholicism* (Philippine Independence Church) (CIA 2013). The remaining population identifies as Muslim (5%), Protestant (7.3%), *Iglesia ni Kristo* (Church of Christ, 2.3%), or Buddhist (0.1%) (Pew Research Center 2010). Growth is occurring within what has been deemed as the “Charismatic Catholic” churches, most notably in the churches of *El Shaddai* and the Jesus Is Lord Movement (Pangalangan 2010). This growth may be counterdemocratic due to Charismatic’s desire to base government on their religious values and the presence of a Muslim minority in the south Philippines (Kessler and Ruland 2006). This growth may also have been exacerbated as a result of the conflict in Mindano (Du and Chi 2016).

Religious Behaviors and Beliefs

From the early 1990s to the late 1990s, data shows that Filipinos are becoming slightly more fundamental to their holy book as well as the tenets of their faith. This may explain a rise in intolerance toward nonmajority sexual behaviors. However, this contrasts with Filipinos praying and attending formal religious services less than they previously did. Religious individuals are more tolerant of women working outside of the home. Additionally, more Filipinos believe that churches should play less of a role in governmental affairs (Abad 2001). For Filipino youth, religion and spirituality remain very closely intertwined. This affects social behaviors, including Filipinos who are religious being more open to help members of their out-groups as well as their in-group, which is atypical. This may be a result of the Filipino value of *Maka-Diyos*, in which self and service to society is prized (Batara 2015).

Armed Religious Conflict

Despite being a small minority in terms of percentage, the Muslim population does play an active role throughout the Philippines. “Moro, not Filipino,” is a popular slogan among Muslim Filipinos (McKenna 1998). Conflicts between the government and extremists of the Moro Islamic Liberation Front have cost over 120,000 lives since 1997. It has been estimated that more than 2 million people have been displaced, the majority in Mindanao. A peace accord was signed in March of 2014 (Centre for Humanitarian

Dialogue 2014). In this, the Supreme Court allowed sharia laws and the jurisdiction of sharia courts in Mindano to be independent of the central government, allowing further religious influence in government. Hui (2012) argues the separatist elements of Moro religious culture are the greatest domestic issue in the Philippines.

Political Intersection

Despite an official separation of church and state, the Supreme Court of the Philippines referred to religion and state as a “diabolical union” (*Pamil v. Teleron*, G.R. No. 34854, 1978), there remains much overlap. Catholic bishops have argued this separation is to protect the church from the state interfering in religious matters, not to stop the church from expressing its opinion on state matters. This was notable in the *Catechism on Family and Life for the 2010 Elections*, in which they urged voters to consider their religion in their voting process, specifically in regard to voting on contraceptive use for women. It has been noted that this influence leads to governmental restrictions on women’s bodies (Ruiz 2004). Additionally, *Iglesia ni Kristo* and *El Shaddai* previously adopted official candidates for public office (Pangalangan 2010). This intersection is transitioning as the Catholic Church becomes increasingly pluralized and international women’s health and pro-life organizations grow in influence (Buckley 2014).

Religious Culture and Mental Health

The 300 years of colonization by Spanish and American forces have created many similarities between religion in the Philippines and in the Western world. However, differences remain in terms of values, specifically related to collectivism (Piedmont 2007). Collectivism plays a strong role in health care. When treating mental health, Filipinos are likely to search for alternative sources of treatment in the form of faith healing “*albularyos*,” friends, family, and faith in their religion (Sanchez and Gaw 2007). Additionally, these cultural influences and reluctance for traditional psychological health services continues even when Filipinos reside in Western nations (David 2010).

Issues

Domestic Violence

Spousal violence experienced by Filipino women has been broken down into three categories: physical, sexual, and other, such as emotional or economic (Philippine

Commission on Women 2014). Surveys have reported numbers as high as 3 in 5 women experiencing domestic violence (Philippine Commission on Women 2016). The National Statistics Office surveyed Filipino women between the ages of 15 and 49 and found that 1 in 5 reported physical violence, and 1 in 10 reported sexual violence. Domestic violence appears more prevalently in lower socioeconomic classes and with lower levels of education.

Sixteen percent of women reported ever hitting, slapping, kicking, or physically hurting their husband (Philippine Commission on Women 2014). Because of domestic violence, 10 percent of women suffered severe injuries (e.g., sprains, dislocation, and burns). Ten percent of women also report attempted suicide related to domestic violence. In 2004, the Anti-Violence against Women and Their Children Act was passed and made acts of violence against women and children punishable by law. Under the Family Code, Article 55 allows for domestic violence of a spouse to qualify as grounds for legal separation (Philippine Commission on Women 2016).

Sexual Violence

Thirty-three percent of women in the Philippines have experienced violence at some point in their lives (UNDP 2015). In 2013, 10,963 cases of violence against women aged 15–49 years old were reported as a part of the National Demographic and Health Survey (NDHS) administered to individuals in the Philippines (Philippine Statistics Authority 2013). However, the number of reports to the police in 2014 was substantially higher than reported on the NDHS. In 2014, the Philippine National Police filed 49,883 reports of violence against women, including physical injuries, rape, acts of lasciviousness, threats, and attempted rape (Philippine Statistics Authority 2013). The difference in the number of reports speaks to the difficulty in reporting violence and in capturing the true numbers of violence against women. Furthermore, the numbers represented in 2014 are just the cases that lead to police intervention. There may be more cases that were not reported on demographic surveys, to the police, or to social services. The Department of Social Welfare and Development reported 3,184 cases of girls who experienced violence, such as sexual abuse, neglect, physical abuse, abandonment, sexual exploitation, and child labor (Philippine Statistics Authority and ICF International 2014).

Filipinas have also suffered from a history of sexual violence by foreign occupations. In fact, Margold suggests that

violence against women correlates with levels of foreign troops. She explains, “Between the Vietnam War era and 1991, Filipinas were subjected to many forms of dehumanization and violence at the hands of U.S. (United States) soldiers, including rape, battery, widespread abandonment of the Amerasian children they fathered, and a legacy of sexually-transmitted disease” (Margold 2003). Even before the Vietnam War era, sexual violence began with the initial occupation by the United States in the early 1900s and with other prior occupancies (Maza 2015). Unfortunately, remnants of such sexual violence continue with “juicy bars” found in the Pacific, where U.S. soldiers are said to pay to play bar games with a local employee that results in the exchanging of sexual company. U.S. commanders do forbid such behavior, citing the reinforcement of objectification of women and sexist attitudes (Lamothe 2014). Now organizations like GABRIELA fight to stop such military sexual violence against women (Moon 2009).

Human Trafficking

Human trafficking of women typically occurs under bleak circumstances. A child may have lost one or both parents, be sold to provide money for a starving family, might be a product of military conflict, or is living in extreme poverty. The Philippines holds a Tier 2 status, indicating “not compliant,” but putting forth efforts to meet the standards set by the Trafficking Victims Protection Act. It is estimated that 300,000–400,000 women are trafficked, with an additional 60,000–100,000 children trafficked (De La Paz and Marcelo 2007). In 2003, the Anti-Trafficking in Persons Act was passed and made human trafficking a crime. To help protect against trafficking, the Philippine Guidelines on the Protection of the Rights of Trafficked Women were created to outline prevention, rescue and recovery of trafficked women, postrescue integration, and legal protection, among other things (Philippine Commission on Women 2013).

Typhoon Response

The Philippines experiences an average of eight tropical storms each year, making it the most storm-exposed country (Brown 2013). Typhoons cause damage to the environment, financial burdens, and high death tolls. Filipino women encounter gender-specific barriers as a result of these natural disasters. Typhoon-affected areas often have large populations of pregnant and lactating women. During evacuations, access to reproductive health care can be a critical challenge. Sanitation is vital for new mothers and

newborn children, and providing adequate sanitation can be a hard task to accomplish during a natural disaster.

Sexual violence is often a risk experienced by women. Shelter should be provided in a way that will be safe from violence for women. Health care and treatment for these attacks is also a critical component in disaster relief. Resources (food and nonfood items) are now often distributed to families with special attention to the possibility of a household headed by a female. Past relief efforts have not shown an equal distribution of resources. An alert in 2013 by the Inter-Agency Standing Committee (IASC) released a list of gender-sensitive response priorities, emphasizing the specific needs of women during these incidences as well as a call for equality in allocation of resources.

Polynesia

Overview of Country

Polynesia is a triangular region of the east-central Pacific Ocean; its northern apex is the Hawaiian Islands, its western base angle is New Zealand, and its eastern base angle is Easter Island. More than 1,000 islands, totaling 115,000 square miles, are scattered across this 70 million square mile region. The island groups or countries within Polynesia are New Zealand, the Hawaiian Islands, French Polynesia, Samoa, Tonga, Wallis and Futana, Niue, the Cook Islands, American Samoa, Easter Island, Rotuma, Tuvalu, the Midway Islands, and Tokelau (Hartney 2015).

Some linguistic and archaeological evidence indicates that the Lapita people, originally from Taiwan, first settled

western Polynesia around 3,000 years ago. The Lapita were ocean explorers who reached New Guinea by 2000 BCE; the Solomon Islands by 1600 BCE; Fiji, Tonga, and western Polynesia by 1000 BCE; and finally Micronesia by 500 BCE (The Editors of the Encyclopedia Britannica 2016). This is the express train model of Polynesian migration; however, it is not universally accepted. Other researchers claim that genetic evidence supports that Polynesians are descended from peoples from Wallacea and Melanesia (Oppenheimer and Richards 2001). Other experts propose that the Lapita intermixed with native Melanesians and Polynesians (Handwerk 2008).

Polynesians developed a diverse, complex civilization with some shared elements. Many material goods, terms and names, art, and medical techniques are remarkably similar. A principal cultural characteristic was expert adaptation to and mastery of the sea. Navigators were highly respected members of society. Islands each maintained a house of navigation, which included an area for building canoes. Polynesians were skilled hunters and fishermen (Kahn et al. 2016). They were also skilled artists and often elaborately decorated everyday items. Navigation, hunting, and craftsmanship skills were handed down through families, and today traditional craft items remain important for traditional living and the tourist trade (New World Encyclopedia 2015).

Polynesian culture has been misrepresented as overtly sensuous and sexually unrestrained—misperceptions publicized widely by early European visitors and 19th-century anthropologists. The most famous of the latter may be Margaret Mead (1901–1978), whose 1928 book *Coming of Age in Samoa* described Samoan culture as implicitly favoring premarital sexual freedom. Generally, Polynesians "took a very direct, realistic, and physical approach to gratification of the senses and while traditional culture placed restrictions on sexual behavior, the range of acceptable behavior was wider" (Kahn et al. 2016 para. 21) than among the early Europeans who first documented it. This cultural misunderstanding has become a resilient stereotype of extreme sexual promiscuity and high sexual appetites among Polynesian people (Kahn et al. 2016).

Polynesians settled in either hamlets or villages. Hamlets were more common on the larger volcanic islands because food sources were both diverse and spread out. Hamlet settlement patterns, typified in French Polynesia, involved small clusters of houses that spread up sides of valleys. Lush gardens, taro patches, and groves of coconut and breadfruit trees were cultivated nearby. However, in

Samoa, the settlement pattern shifted to fortified coastal villages of 30 or more houses. Villages were organized and surrounded by a wooden or stone wall. The New Zealand Maori constructed large hilltop, fortified villages (*pas*). Exterior protections included ditches, palisades, trenches, and terraces. Village interiors were divided by other defensive fortifications that were intended to facilitate battle should enemies breach exterior barriers (Kahn et al. 2016).

Not all Polynesian islands are independent nations, nor do they all have comprehensive systems for collecting and reporting data; therefore, indicators and statistics are not available and reported for each. In 2014, New Zealand (discussed in another chapter of this volume) was ranked 32nd, Samoa 97th, and Tonga 148th, out of 155 nations, by the UN Development Programme's Gender Inequality Index (GII) (UNDP 2015a, 2015b, 2015c). The 2014 Global Gender Gap Index for New Zealand was 0.777, ranking it 30th out of 142 countries (WEF 2016).

Girls and Teens

There are relatively high rates of teenage pregnancy, unwanted pregnancy, and sexual violence in many Pacific island countries (PICs). Additionally, Western influences have impacted the health status and may be influencing the body image of Polynesian girls.

Teen Pregnancy

From 2003 to 2013, fertility rates of women 15–19 years old declined in several PICs but remained high in others. The latter is likely due to the lack of adolescent sexual and reproductive education and of accessible modern contraception (UNFPA 2013). Sex education is poor, if even present, in schools, and few youths interact with health services or educators. Information regarding sex and reproduction is often received informally and is not always accurate. Misinformation about conception and pregnancy is high, including a belief that pregnancy cannot occur at first intercourse (UNICEF et al. 2005). In many PICs, the contraceptive prevalence rate (CPR) for women 15–24 years old is low due to poor access and availability or partner refusal to utilize contraception. Many PICs have high populations that are younger than 14, and high adolescent fertility rates make introducing programs to promote sexual and reproductive health a high priority (UNFPA 2013). Abortion is legal, available, and performed by health care providers in some PICs, although a heavy social stigma exists (Statistics New Zealand 2003).

Teenage pregnancy is not always the result of lack of education or contraception. It is also closely related to poverty, unequal gender roles and expectations, and gender-based violence. Often, unwanted pregnancy results from forced sexual relations. Polynesian girls are often unprepared to deal with peer pressure, are unaware of their rights, or lack the social skills to refuse intimacy (UNICEF et al. 2005). In many PICs, a heavy stigma is associated with sexual violence, making women reluctant to report attacks and resulting in lowered access to emergency contraception, counseling, and legal action. Studies in several PICs revealed that 3–8 percent of women had their first sexual encounter before age 15 and 23–50 percent before age 18. Of the former, 23–59 percent reported that this first encounter was forced (UNFPA 2013).

Teenage pregnancy is one of the main reasons girls leave school, voluntarily or not, negatively impacting future employment prospects. In response, the Cook Islands passed a 2012 law prohibiting schools from expelling pregnant girls and requiring some flexibility for student mothers. Babies often become financial burdens for families because the new parents are typically unemployed and unprepared to raise a child. This may lead to neglect, malnutrition, or abandonment. Teenage mothers experience greater risks of partner violence and face harsh social stigma, often resulting in public shunning. These factors contribute to the higher rates of poverty and family breakdown experienced by the children of teenage mothers compared to those of older mothers. Teenage pregnancy perpetuates many barriers because lack of parental preparation inevitably takes its toll on subsequent generations (Ragogo 2004; UNICEF et al. 2005).

“Fat Is Beautiful”

Traditional Polynesian body ideals view large bodies as healthy, attractive, and a positive reflection of family and community. A person's body is traditionally viewed as a reflection of how well family and community care for and provide for that person. Fattening ritual feasts were traditionally practiced to enhance the sexual attractiveness of an individual (Reade 2013). Some experts believe that Polynesians are genetically predisposed to convert extra calories into fat as a result of centuries of periodic, natural food shortages; this is known as the “Thrifty Gene” hypothesis (Senthilingam 2015). Because Polynesians are naturally larger, this norm has become attractive.

PICs are increasingly exposed to and influenced by Western media, which largely encourages women to be

underweight. Traditional culture encourages a value on larger bodies, but Western acculturation introduces a value on thinness. This cultural contrast is causing concern that increased eating disorders may result. However, despite the increased prevalence and influence of Western media, most Polynesians still value larger body sizes and consider larger individuals more attractive, affluent, and happy (Cormier et al. 2012).

Education

Many PICs' educational systems face similar challenges (UNESCO 2015). Academic results are poor even though education expenditures are relatively high. Poor assessment results in a lack of outcome data; what data are available are underutilized (Levine 2013). However, many reforms have been enacted, and some promising results have been realized.

Preprimary and Primary Education

Primary and lower-secondary education access has improved; however, many PICs have not achieved full access to preprimary and upper-secondary education. Preprimary enrollment rates vary from 90 percent to 95 percent in the Cook Islands, Niue, and Tuvalu to below 50 percent for Samoa. Primary school enrollment was at 89 percent for the region in 2012. Many countries have the necessary capacity and are on track to achieving universal primary education, unlike at the preprimary and secondary levels. International funding and recent government emphasis has resulted in dramatic primary enrollment increases in the Cook Islands and Samoa; however, Tongan data indicate an enrollment drop (99–90 percent from 2000 to 2012) (UNESCO 2015).

Enrollment does not equate to attendance; student and teacher truancy is pervasive and is influenced by (1) low cultural value on education; (2) perception that teachers do not teach; (3) bullying; (4) lack of transport; (5) children required at home to mind younger siblings; (6) lack of antitrucancy laws; (7) lack of remediation; (8) lack of uniforms or food; or (9) poor sanitation. The largest consistent barrier is geographical; some students must walk or paddle up to two hours to reach the nearest school (UNESCO 2015). Around 40 percent of children in PICs do not complete primary school, and only 20 percent of those graduate from secondary school (Levine 2013).

Secondary and Vocational Education

Around 5 percent of PIC secondary education students are enrolled in vocational education, and about 30 percent are female. Enrollment in lower-secondary education increased (from 44% to 77%) from 2000 to 2012, but it was still below the world average of 85 percent. Enrollment in upper-secondary education is lower, and this drop is due to lack of capacity, school and travel expenses, and entrance exams. Some youth leave school to seek employment or apprenticeships, but many simply drop out. Many PICs offer nonformal education opportunities. The Cook Islands has community programs that transition male dropouts back into formal education or into trades-based courses. In Tuvalu, community training centers offer non-formal education courses to students who cannot access secondary education (UNESCO 2015).

Access does not guarantee quality, and in some PICs, completing school does not necessarily result in obtaining basic literacy or math skills (Levine 2013). The average adult literacy rate in the Pacific is 71 percent, below the world average of 84 percent. There is a significant difference between the numbers of illiterate youth (436,000) versus adults (1.9 million), indicating some positive effects of recent reforms (UNESCO 2015). However, UNICEF (2011) reports a lack of qualified teachers, inadequate instructional materials, weak management, poor information systems, and low levels of parent-community involvement in many PICs.

Many PICs have eliminated primary school fees, improving primary access and resulting in increased demand for secondary education; however, access to the latter is not equitably available (UNESCO 2015). At the secondary level, poorer children drop out more frequently or are prohibited from attending at all. As a result of poor-quality primary education, many low-income students fail to achieve the required grades to enter public secondary schools and cannot afford private education (Levine 2013). Low-quality primary education also precludes access to tertiary education. This is a cascade effect; more affluent children have better access to higher-quality primary education and so experience better educational outcomes, which lead to access to higher-quality secondary and, eventually, tertiary schools. In most PICs, tertiary education is highly subsidized through government and private scholarships. Such funding is intended to assure access and equity; however, the students who need the

funding rarely remain in the educational system long enough to even apply (Levine 2013).

Health

Health care across the PICs is a mix of private and publicly provided primary and secondary care facilities, with New Zealand having some tertiary services. Many countries rely on international referral agreements to provide tertiary care.

Access to Health Care

The Cook Islands' Ministry of Health is the main provider of care; services are provided through child welfare clinics, dental clinics, health centers, and one general hospital (WHO 2012). Niue partners with several international governmental and nongovernmental organizations (NGOs) to provide health care. The World Health Organization (WHO 2014a) reported good maternal and child health care in Niue provided through a community outreach system of village visits and inspections by public health nurses and officials. The Samoan health system is a combination of public and private financing and provision of services (WHO 2013). All Tongans receive free health care, and WHO (2014b) has commended Tonga for its commitment to improving the health of its population; however, it also cites family planning, sexually transmitted disease prevention, and health services funding as areas of concern.

Tuvalu provides free health services, which provide most of the key health care required; serious cases are sent for care to Fiji or New Zealand under a medical referral partnership. There is only one hospital in Tuvalu, but several new health centers have been established since 2008 (WHO 2014c). New Zealand has a predominantly tax-funded health system that provides universal coverage, with services provided by public, private, and nongovernmental sectors. Roughly 40 percent of adults hold supplementary private insurance, and all adult dental and optometry services are privately paid for; basic pediatric dental services are free. New Zealanders experience good health status overall; however, significant inequities exist in Maori health. In 2015, 27 percent of New Zealand adults and 20 percent of children had an unmet primary health care need (Cumming et al. 2014).

Maternal Health

Median maternal age at first birth ranges from 23.5 years in Tuvalu to 27.8 years in New Zealand (CIA 2016d,

2016g). Fertility rates vary from 1.75 children born per woman in Wallis and Futana to 3.26 children born per woman in Tonga (CIA 2016f, 2016h). Birth rates range from 13.33 children born for every 1,000 people in New Zealand to 23.74 children born per 1,000 people in Tuvalu (CIA 2016d, 2016g). Maternal mortality rates range from 11 deaths per 100,000 live births in New Zealand to 124 deaths per 100,000 live births in Tonga (CIA 2016d, 2016f). WHO (2014a) reported no maternal deaths in Niue from 1999 to 2010. Infant mortality ranges from 4.43 deaths per 1,000 live births in Wallis and Futana to 19.57 deaths per 1,000 live births in Samoa (CIA 2016e, 2016h). The 2007 contraceptive prevalence rate in Tuvalu was 30.5 percent (CIA 2016g) and 29 percent in Samoa in 2012 (WHO 2013).

Diseases and Disorders

The prevalence of adult diabetes in the Pacific is among the highest in the world, ranging from 14 percent to 47 percent. Around 40 percent of the region's population has cardiovascular disease, diabetes, or hypertension, which account for 75 percent of all deaths and 40–60 percent of health care expenditures (WHO 2010). Health concerns were caused in part by a decrease in physical activity and a growing dependence on Western diets, which began in the early 20th century. Traditional foods (fresh seafood, meat, and local produce) have been replaced by higher calorie, lower nutritional value foods such as rice, sugar, flour, canned meats, canned produce, soft drinks, and beer. The ability to purchase imported foodstuffs is a sign of social status in many PICs. Polynesians who maintain a traditional diet benefit from lower rates of diabetes compared to those of Western populations. Physical activity has greatly decreased due to increases in technology and civil service employment (WHO 2003).

Employment

Throughout Polynesia, there is traditional gendered division of labor; men are responsible for fishing, construction, and protection of the family, and women are responsible for collecting and preparing food and for manufacturing household items. Agricultural responsibilities are typically shared. Modern types of employment are found in urban areas; yet, economic growth lags behind other developing regions at only 3 percent. This lag is largely due to small size, remoteness, and vulnerability to natural disasters (van Trotsenburg 2015).

Gender Disparities in Vocational Training and Professions

Gender disparities in education exist in many PICs. A higher percentage of males than females of the correct age are enrolled in primary and lower-secondary education. For postsecondary and vocational education, gender disparities are reflected through males or females being overrepresented in certain types of programs; males are overrepresented in maritime programs and females in teaching and nursing. Such disparities do not necessarily reflect inequality of opportunity, but rather social pressure to conform to cultural expectations of appropriate occupations for men and women. Such educational disparities directly impact the gender makeup of the workforce. PICS have more female than male teachers; however, the extent of this gap differs between countries and levels of education. Preprimary teachers are predominantly women; in Tonga and the Cook Islands, there are no male preprimary teachers. This gender gap remains, but it shrinks at the primary level and reverses at the lower-secondary level, where a higher percentage of teachers are male (UNESCO 2015).

There is a generalized lack of alignment between the supply of skills and the demand for them in Polynesia. A 2014 study analyzed labor market demand and skills gaps and shortages in several PICs. The results showed that, in most cases, a higher proportion of foreign workers possessed the required qualifications for higher-paying, professional jobs than national workers. This indicates disconnect between available vocational and tertiary educational training and formal labor market needs; in essence, many PICS must import workers to meet skilled and professional labor needs.

The informal sector is the dominant labor market of most PICs and is where most native Polynesians find work. Increasing the skill level of informal economy workers should increase employment, enabling workers to actively participate in the development of their communities (UNESCO 2015). More than half of Polynesians are under age 24. The number of youth of working age is expected to increase over the next decade. PICs will find it difficult to meet the growing demand by youth for gainful employment because of small, fragile economies and severely limited formal-sector employment (van Trotsenburg 2015), which could result in increased poverty levels or emigration.

Family Life

Many Polynesian societies traced ancestry through the male line (patrilineality). After marriage, couples generally

resided with the husband's extended family. Patrilineality was commonly utilized for determining ancestry, but it was not employed universally. If it were advantageous, Hawaiian descent could be traced through women (matrilineality). The method utilized for tracing lineage had consequences for inheritance, titles, and societal standing. In matrilineal societies, married couples lived with or near the wife's parents, often forming large multigenerational clan families. Many modern Polynesian societies are highly matricentric in their traditional jurisprudence (Hage 1998; Hage and Marck 2003; Marck 2008). Adoption was very common because it increased the flexibility of kinship. Adoption was viewed as accruing additional parents, not as replacing biological parents. Siblings and cousins frequently adopted one another's children, and grandparents often adopted grandchildren. Adopted children moved freely among all the households, often resulting in a large extended-family structure (Kahn et al. 2016).

Pregnancy and Childbirth

Pregnancy and childbirth in PICs are traditionally celebrated community events. While some of the traditional practices are changing (particularly in urban areas), many still exist. A woman's mother and other female elders are expected to teach the pregnant woman about healthy habits, traditions, and taboos related to taking care of herself and the baby (Kaipo 2016). Pregnant women are typically well cared for; family and neighbors often prepare special foods thought to promote easy labor or to help the baby grow large and strong. Maori believe that babies are aware during pregnancy and that keeping mothers calm promotes infant health and vitality; therefore, pregnant Maori are often given belly massages by their husbands or female relatives (Mothers Matter 2015a, 2015b). Pregnant women and new mothers are discouraged from performing housework or heavy labor. New mothers and babies often stay with the mother's family and are taken care of for up to several months. Breastfeeding is encouraged and common; infants are fed on demand, typically immediately after birth. Breastfeeding is believed to be contraceptive by many Polynesians (Queensland Health 2009).

Birth occurs at home or the hospital. Babies are usually delivered by women because modesty and humility are strong Polynesian values; it can be humiliating to have one's genitals exposed to a man other than the husband (Mothers Matter 2015a). Laboring Samoan women are forbidden from crying out in pain and may be slapped by

female family members if this is done. Laboring Tongan women have their hair washed because they may not wash it again for 30 days after delivery (Kaipo 2016). After birth, washing and massaging are common practices. In Niue, an elder performs such massages to cleanse the baby, discouraging any toxins. Samoan babies are massaged with blood from the umbilical cord and bathed after birth. Many Polynesians babies are frequently massaged with coconut oil, especially after bathing. Newly delivered mothers also typically bathe almost immediately. After giving birth, a Samoan woman's abdomen is bound with cloth, which will remain in place for a month and is believed to keep the uterus from falling down. Afterward, she will bathe and place a bowl of steaming water between her legs, allowing the steam to rise and cleanse the birth canal (Kaipo 2016; Queensland Health 2009).

Disposal of the afterbirth has great significance; the placenta must be disposed of properly to protect the newborn. Samoans may wrap the placenta in cloth and bury or burn it or throw it into the sea. Maori also either bury the placenta or throw it into the sea. In Niue, a family typically buries all afterbirth in the same place. In Tonga, the placenta is thrown into the ocean if the baby is a boy and is buried under a *Hiapo* or *pandanas* tree if it is a girl. These practices are believed to ensure boys will be good fishermen and girls will be good weavers or tapa makers (Kaipo 2016; Mothers Matter 2015a).

Politics

New Zealand and Tuvalu are members of the British Commonwealth, but they are both independent parliamentary democracies. The Queen of England is the official head of state, but each has an elected prime minister. Suffrage is universal at age 18 (CIA 2016d, 2016g). The Cook Islands, Niue, and Tokelau are dependent areas of New Zealand (CIA 2016d). French Polynesia and Wallis and Futana are overseas collectivities of France and not independent nations; the elected French president is the head of state. French Polynesia has an elected president, and Wallis and Futana has an elected president of the territorial assembly; each serves as the head of government.

American Samoa is a U.S. territory. The U.S. president is the chief executive; however, there is an elected governor (CIA 2016a). Tonga is an independent constitutional monarchy with a hereditary king as the head of state and a prime minister (appointed by the king from among the members of Parliament) as the head of the government;

suffrage is universal at 21 (CIA 2016f). Samoa is an independent parliamentary republic with an elected chieftain as the head of state and an elected prime minister as the head of the government; suffrage is universal at 21 (CIA 2016e).

Women's Movement in New Zealand

The Ministry for Women arose from developments in New Zealand's women's liberation movement, which surfaced in 1970 as part of a worldwide movement. New Zealand feminists demanded equitable opportunities for education and employment, equitable pay, free child care and contraception, and legalized abortion. The Women's Electoral Lobby (WEL) was formed in 1975 to increase the participation of women in politics and to help elect individuals dedicated to working for women's equality. Many of WEL's efforts were successful, and by the 1980s, the New Zealand government felt that women needed a formal cabinet-level voice. The Ministry of Women's Affairs (Ministry for Women as of 2014) was established by the government in 1984. The Ministry for Women is the only public-sector body specifically established to address the needs of women in New Zealand. The ministry addresses these needs by providing guidance and policy recommendations aimed at improving opportunities and outcomes for women, their families, and their communities overall. The Ministry of Women was the first public-sector body to establish a unit specifically to address the unique needs of the Maori (Ministry for Culture & Heritage 2016; Ministry for Women 2016).

LGBT Rights

Polynesia has diverse laws regarding LGBT individuals that range from granting significant rights to enforcing criminal penalties for homosexual activity. New Zealand, French Polynesia, and Wallis and Futana have legalized same-sex activity, civil unions and marriages, adoption by same-sex couples, LGBT individuals openly serving in the military, and antidiscrimination laws protecting sexual orientation and identity. Both French Polynesia and Wallis and Futana require medical and psychological diagnosis prior to and sterilization as part of gender reassignment (The Local 2015). No other PICs legally recognize same-sex civil unions or marriages. Male same-sex activity is illegal and punishable by prison or corporal punishment in the Cook Islands, Samoa, Tonga, and Tuvalu, although this is rarely enforced (Itaborahy and Zhu 2014).

Religious and Cultural Roles

European missionaries had significant influence in Polynesia, and today the majority of Polynesians identify as Christian. Modern Christianity in many PICs is heavily influenced by local traditions and cultures.

Traditional Religion

Many religious attributes were common over the Pacific region, specifically a shared creation story, deities, and daily religious tasks. The supernatural was part of the continuum of reality, not a separate category of experience. Spirits, deities, and ancestors were seen as part of daily life and were feared and revered; great care was taken not to offend them. The spirits of the dead dwelt in an underworld, although there was no notion of judgment. Major deities were personifications of nature and required worship, which could involve sacrifices (including human), chants and recitations, feasting, ritual sex, and other elaborate practices, often preceded by long fasting and abstinence. Creation stories told of a chaotic time when the world was formed in the sea by a creator deity or of the separation of the primal parents Sky-father and Earth-mother, followed by the formation of life (Elsmore 2016; Kahn et al. 2016).

Taboo

Polynesian religions held all things to be endowed with varying levels of sacred powers, or *mana*. *Mana* could be nullified, and many taboos were intended to prevent this nullification. Violations of taboo were believed to result in divine punishment, bad luck, or illness (Kahn et al. 2016). Taboos could be imposed by individuals possessing great *mana* (e.g., chiefs, priests). For example, if a chief's shadow was touched by a commoner, the chief's *mana* could only be repaired through that individual's death. This explains why it is bad manners to step over someone's legs, pass a hand over someone's head, or stand above a high-ranking person in many PICs; such actions are believed to injure *mana* (Kahn et al. 2016).

Common men possessed lesser *mana* and carefully protected it. When preparing for dangerous tasks, they purified themselves through eating or avoiding specific foods or entering into seclusion. Women had great *mana* due to their reproductive abilities. Multiple taboos were crafted to ensure both the protection of women's *mana* and the protection of *mana* of other people and objects from

women. In French Polynesia, taboo prohibited women from riding in canoes. It was believed that a woman's *mana* and the canoe's *mana* would compete; therefore, only in an emergency could this taboo be violated (Kahn et al. 2016). Traditionally, certain foods were forbidden to women; in Hawaii, hog, bird, turtle, and several species of fish flesh were reserved for deities and men and could rarely be eaten by women.

Mothers and newborns were considered taboo for a time after birth. Before marriage, women were *noa* ("common," the opposite of taboo) and could have as many sexual partners as desired; after marriage, they were taboo and had to remain monogamous (Frazer 2016). One of the strongest Polynesian taboos insulates menstruating women from male contact (Steiner 2004). Similar taboos exist in other cultures and have traditionally been considered oppressive to women. However, some anthropologists believe menstruation taboos are protective of and empowering to women (Buckley and Gottlieb 1988). Where menstrual taboos retain their traditional force, a menstruating woman is to be respected without question. Her taboo is a part of herself, her ritual potency, and is inseparable from her flesh and blood (Durkheim and Ellis 1963).

Penalties for violating taboos could be religious or civil. Religious penalties were believed to be inflicted by offended deities or spirits. Civil penalties were imposed by society and varied from death (Hawaii) to judicial robbery (New Zealand). When a New Zealand taboo was broken, friends and neighbors would rob the offender of his or her possessions.

Taboo could often be removed through various ceremonies. In New Zealand, a taboo could be removed by taking food or drink from the hand of a child or grandchild, although the child was then tabooed for the remainder of the day. Taboo could be removed from newborns by consecrating them with potato or fern root cooked over a ceremonial fire (Frazer 2016). Taboos varied, but they were powerful societal and religious influences; some are still practiced. In 2006, the king of Tonga died, and it was taboo to touch the king. The 40 undertakers who prepared his body were prohibited from using their hands for three months. The undertakers, or *nima tapu* ("sacred hands"), were housed in a special residence and fed by hand and cared for during the 100-day mourning period. Three centuries ago, *nima tapu* would have been strangled or had their hands severed after taking part in a royal funeral (UPI News Source 2006).

Influence of Christianity

European Christian missionaries (late 18th to early 19th century) strove to replace local Polynesian culture and traditional customs by spreading the Christian faith. Sacred places were replaced by Christian churches, and local deities and practices were condemned or outlawed. Western influence quickly transformed the lives of Polynesians (Elsmore 2016). More than half of New Zealanders identify as Christian, although only 15 percent regularly attend church. New Zealand has no officially established church, and freedom of religion is protected. A recent significant increase in non-Christian immigration into the country is changing the religious makeup of the population; Sikh, Hinduism, Buddhism, Islam, and Spiritualism makeup the most significant minority religions (Immigration New Zealand 2013).

Tongans are overwhelmingly Christian and ardent churchgoers; churches function as spiritual and social hubs. Sunday is a strict Sabbath, dictated by the constitution, and no trade is permitted. The Tongan king and royal family are members of the Free Wesleyan Church, as is 35.5 percent of the population. The Latter-day Saints make up 18 percent of the population, Roman Catholic 15 percent, and the Free Church of Tonga 11.5 percent, according to the 2011 census. The largest non-Christian faith is Baha'i. The constitution protects the freedom of religion, and this right is generally respected (Tonga Department of Statistics 2011). Samoans are almost all Christian (98%), with the Congregational Church of Samoa representing 31.8 percent, Roman Catholic 19.4 percent, and Latter-day Saints 15.1 percent of Christians. The constitution provides for the right to choose, practice, and change the religion of one's choice, and legal protections exist to prevent religious discrimination (U.S. Department of State 2012).

Issues

Polynesia is a region of coral atolls and volcanic islands spread across a vast swath of the Pacific Ocean. Home to less than 1 percent of the global population, their unique environment provides important ocean resources. The many issues PICs face are as diverse as each island's rich culture and history.

Climate Change

Historically, Polynesia has experienced numerous, unpredictable natural disasters and environmental changes, which is why Polynesians have developed cultural

resilience strategies. During the last century, Polynesia has experienced increased temperatures, rising sea levels, coral bleaching, increases in coastal flooding, shoreline erosion, and increased tropical storm frequency. Warming and sea-level rise are expected to accelerate, which could cause profound environmental, societal, and developmental changes within the region. These environmental changes may be related to the increasing pace of globalization and the growing populations' demand on limited resources. Due to the long cultural history of dealing with environmental change and disaster, Polynesians' awareness of climate change and commitment to crafting adaptation agendas is slow to emerge (Nunn 2012).

Eight of the top 20 countries in the world in terms of annual losses caused by natural disasters are PICs; Tonga is one of the two most vulnerable nations. The average annual cost of natural disasters to small PICs is equal to almost 2 percent of the gross domestic product (GDP) and has reached as great as 20–30 percent of GDP in Tonga and Samoa. These vulnerabilities could increase due to global climate change, which has been correlated with sea-level rise and the increasing strength of tropical storms. Such environmental changes threaten even the existence of some low-lying island nations.

Some international groups, determined to aid PICs, have launched projects intended to mitigate such impacts of climate change. Because extreme weather events are expected to increase in size and frequency, the development of quick and effective responses to natural disasters is imperative. Tonga and Samoa have received emergency support in the wake of natural disasters (van Trotsenburg 2015). Some experts believe these efforts are insufficient and recommend the relocation of people to less vulnerable locations within the region be planned for and that regional agencies and governments promote and disseminate climate change information and adaptation strategies (Nunn 2012).

Samoan *Fa'afafine*

Samoa has a large third-gender community called *fa'afafine* ("in the manner of woman"). Tonga has a similar community referred to as *fakaleiti*, and in Hawaii, such individuals are called *mahu*. *Third gender* refers to individuals who are categorized by themselves or society as neither male nor female. *Fa'afafine* are biological males who express feminine gender identities (Schmidt 2001). The community is heterogeneous in the expression of feminine traits and behaviors; some "pass" as women in public, and others only

engage in intermittent feminine gender expressions (Bartlett and Vasey 2006). *Fa'afafine* are typically identified at an early age for their propensity for traditionally female tasks; their gender is largely defined by their labor contribution to the family (Schmidt 2001). Samoan parents seldom ridicule or display displeasure toward a *fa'afafine* child. Only 20 percent of parents admitted to attempting to stop a *fa'afafine* son from engaging in feminine behaviors. Some *fa'afafine* reported believing they were female until young adulthood (Bartlett and Vasey 2006). Parents with no daughters may raise a son as *fa'afafine* to ensure a caregiver for their old age or because there are not enough women to complete necessary housework. As a result, *fa'afafine* are traditionally respected for their contributions to families (Goodness 2012).

Fa'afafine engage in sexual relationships with masculine "straight" men with relatively few exceptions; however, referring to *fa'afafine* as homosexual, transgender, or drag queens would be incorrectly applying Western cultural labels to this group. In Samoa "straight" men self-identify as male and are masculine in their gender presentation; such individuals may have male and female sexual partners and yet not identify as gay or bisexual. Many *fa'afafine* adamantly assert that "gays" do not exist in Samoa (Bartlett and Vasey 2006).

Recently, Samoa has experienced a growing homophobia, likely related to Western cultural influences and the changing constructions and expressions of some *fa'afafine*. Traditional Samoan village life is declining, and as people move to urban settings, gender is becoming less identified by work and more by sexuality. Traditionally, village *fa'afafine* were thought of simply as feminine boys, but modern urban *fa'afafine* are beginning to develop more sexualized identities. Some who originally considered themselves *fa'afafine* now consciously identify as gay (Schmidt 2001).

S

Singapore

Overview of Country

Singapore is the world's only island city-state. It is located at the southernmost tip of continental Asia, at the end of the Malayan Peninsula, between Malaysia and Indonesia. The country is roughly 278 square miles in size, comprising a diamond-shaped main island and more than 60 small islets. Owing to its small size, it is often depicted on world maps as a red dot and hence enjoys the nickname "Little Red Dot."

Sir Stamford Raffles is credited as the father of modern Singapore for establishing it as a trading post of the East India Company in 1819. After the collapse of the East India Company, Singapore was ceded to Great Britain, and in 1826, it became part of its Straits Settlements. Singapore was occupied by Japan during World War II, from 1942 to 1945. It gained independence from Great Britain in 1963 and united with other former British territories to form Malaysia. But disputes due to differing political ideologies resulted in Singapore's separation from Malaysia, and Singapore became an independent republic on August 9, 1965.

Despite its small size, a lack of natural resources, and the turbulence in the initial years following its independence, Singapore developed rapidly through the 1960s and 1970s and today is looked upon as a major commerce, finance, and transport hub in Asia with a stable political

and transparent legal environment. It has been ranked first worldwide for "the ease of doing business" by the World Bank for the last 10 consecutive years. In 2015, Singapore was ranked 9th in the world in the Rule of Law Index by the World Justice Project.

In June 2015, the population of Singapore was around 5.54 million, consisting of 3.38 million Singapore citizens, 0.53 million permanent residents, and 1.63 million non-residents (which refers to foreigners who are working, studying, or living in Singapore but do not have a permanent residency status). The population is multiethnic, consisting of 74.3 percent Chinese, 13.3 percent Malays, 9.1 percent Indians, and 3.3 percent of other ethnicities. The sex ratio among residents (which includes only Singapore citizens and permanent residents) was 965 males per 1,000 females in 2015 (Department of Statistics 2015a).

Singapore has made significant strides in the area of women's equality and empowerment since its independence. In 2013, the UN Development Programme (UNDP) ranked Singapore 13th out of 188 nations based on the Gender Inequality Index (GII; 0.088).

At present, women enjoy strong legal protection under the Singapore Constitution as well as in such legislation as the Employment Act, the Women's Charter, the Penal Code, the Protection from Harassment Act, and the Prevention of Human Trafficking Act. Having said that, there are also some areas where the status and protection of women may not be considered entirely satisfactory.

Girls and Teens

Girls and teenagers under the age of 20 comprise approximately 20 percent of the female population as of June 2015.

Labor

Singapore ratified the Convention on the Rights of the Child in 1995. Child labor is prohibited in Singapore. A child must be at least 13 years old to be legally employed. Children between 13 and 15 years of age are only permitted to undertake light duties suited to their capacity in non-industrial settings. For instance, this may include serving drinks in a cafeteria. A child who is 13 or older may work in an industrial setting in which only members of the same family are employed, for example, in family-run shops.

Children between the age of 15 and 16 years may work in industrial settings, provided the employers appropriately notify the commissioner for labor at the Ministry of Manpower and submit a medical report certifying the child's fitness for the work. Further, there are also time restrictions on the working hours of children. Children under the age of 16 cannot work between 11:00 p.m. and 6:00 a.m. Children under 15 years old who are still attending school may only work six hours per day. Children in the age group of 15 and 16 who are still attending school are only permitted to work seven hours per day, except where the children are working in government-approved apprenticeships.

The Ministry of Manpower effectively enforces laws and regulations in relation to child labor. Based on statistics made available by the Ministry of Social and Family Development in 2013, there have been no cases charged for child labor under the employment legislations since 1990.

Having said that, some social workers have reported that the problem of child labor does exist in the country, and some children do have to work to help support their families. Poverty is recognized as one of the main causes for such child labor, with most of such working children coming from low socioeconomic status or ethnic minority communities. These children typically work in low-technology sectors, mainly where there is a need for manual labor.

Sex Education

Sex education is imparted to students from primary school to junior college. The Ministry of Education administers a framework for sex education for children covering the physical, emotional, social, and ethical dimensions of

a person's sexuality. The framework emphasizes quality parent-child communication at home, supportive school leadership, and partnerships with relevant expertise from the community. All schools are required to provide sexuality education to their students aligned with the framework developed by the Ministry of Education.

The sex education curriculum developed by the ministry is holistic and secular and is aimed at students' needs at the different stages of development. The five main themes of sex education are human development, interpersonal relationships, sexual health, sexual behavior, and culture, society, and the law (Ministry of Education, 2016).

Incidences of teenage sex are not infrequent. Social workers are of the view that the early onset of puberty and easy access to sexual materials and information online may be some of the factors responsible for teenagers starting to have sex at the ages of 12 or 13 years as compared to 15 or 16 years a decade ago. Under local laws, sex with a girl under 16 years old, even if she gives her consent, is a criminal offence. Statistics from state courts show a steady number of cases of sex with a minor; 76 cases were reported in 2014.

Teenage pregnancies are another concern in Singapore. According to a report published by the registry of births and deaths in 2015, 341 live births were born to teenagers aged 19 and below. This was a reduction of 16 percent compared with 406 in 2014 (ICA 2015). Though there has been a reduction in the number of teenage pregnancies, it is believed that the reduction is attributable to more teenagers using contraceptives or opting for abortions rather than teenagers abstaining from sex. Abortion is legal in Singapore up to the 24th week. It is noteworthy that parental consent is not needed before a teenager is allowed to have an abortion, although teenage mothers below the age of 16 have to undergo mandatory counseling prescribed by the health promotion board before initiating the abortion procedures.

Girls with Disabilities

Singapore ratified the UN Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) in 1995 and the UN Convention on the Rights of Persons with Disabilities in 2013. The government has taken some steps to improve the lives of people with disabilities. For example, there are laws to safeguard the interests of people with an intellectual disability. New buildings need to conform to requirements for assisting people with different disabilities. Further, the deceased parents' monies are used

for taking care of the financial needs of disabled children. In addition, social outreach and awareness programs are conducted to encourage public perception and positive attitudes toward people with impairments.

In this context, it is worth mentioning that there have been a few persons with disabilities who have achieved a name for themselves in society. One such girl is Yip Pin Xiu, also called “Pin Xiu the golden girl,” a 16-year-old girl suffering from muscular dystrophy who went on to become the first athlete from Singapore to win a gold medal in the 50-meter backstroke in the 13th Paralympic Games in Beijing in 2008.

Child Marriage

The Woman’s Charter regulates the rights of girls and women (excluding Muslims who are governed by the Administration of Muslim Law Act), including in relation to marriage and divorce. The Women’s Charter prohibits child marriage by voiding marriages of persons below the age of 18. The minister is empowered to make an exception to this rule and grant a special marriage license if appropriate consent is obtained from the girl’s parents, guardians, or the court and it can be demonstrated that, among other things, there is no lawful impediment to the proposed marriage. The Women’s Charter also maintains that any person having a carnal connection with a girl under the age of 16, except by way of marriage, is guilty of an offense. The Penal Code makes it an offense of statutory rape if a man has sexual intercourse with a girl, even with her consent, if she is under 14 years of age.

The Administration of Muslim Law Act states that no marriage shall be solemnized if either party is below the age of 16 years, except in special circumstances; the girl must have also attained the age of puberty.

Based on available statistics for 2015, marriages under the Women’s Charter involving grooms and brides under 21 years old (i.e., minors) remained uncommon: 0.2 percent of grooms and 1.1 percent of brides marrying under the Women’s Charter were below 21 years of age. For Muslims, it was 1.5 percent of grooms and 4.2 percent of brides, which was a significant decline from the figures in 2005 (Department of Statistics 2015).

Education

Literacy

It is compulsory for children of primary school age to attend school (excepting those with disabilities). It is also a

criminal offense for parents to fail to enroll their children in school. Exemptions exist for homeschooling or attending full-time religious institutions. In these cases, parents must apply for an exemption from the Ministry of Education and meet certain educational benchmarks. As of 2015, the literacy rate among residents aged 15 years and above was 96.8 percent. The literacy rate among resident males aged 15 years and above was 98.6 percent, and among resident females, it was about 95.2 percent. The percentage of females aged 25 years and above with secondary or higher qualifications was 68.3 percent and those not attending school as full-time students was 10.3 percent.

The education system consists of the following levels: (1) Preschool (4–6 years old) and then primary education starting at age 6 and progressing through a 4-year foundation stage of primary 1–4. It is followed by a 2-year orientation stage of primary 5–6, which provides students with a foundation in English language, native language, and mathematics. (2) For secondary education, students are placed in an “Express” or “Normal” (academic or technical) course, according to their examination results after primary school. The different curricular materials are designed to match the learning abilities and interests of the respective students. (3) Pre-university helps to prepare students for the GCE A-level examination at the end of the two-year junior college or three-year centralized institute course. (4) University is the last level.

In 2014, around 56 percent of females in the age group of 25–29 years held a university degree, and 23 percent had a diploma and professional qualifications. Only a mere 3.7 percent in this age group had below a secondary education.

Sports

Physical education is a compulsory nonexaminable course in the education system. This has encouraged a number of girls and women to take an active part in a variety of sports, including such sports that are traditionally considered men’s sports. For instance, Singapore’s first-ever female windsurfer Audrey Yong, also a 2015 SEA Games gold medalist, represented the country at the 2016 Rio Olympics.

The government has planned to take several steps in the coming years to promote sports as a lifestyle habit. Existing facilities will be rejuvenated, and new sports facilities will be built in the coming years at regional, town, and neighborhood levels to allow people access to sports and recreational facilities within a 10-minute walk of their homes.

Health

Access to Health Care

The Singapore government has invested much effort in promoting healthy living and preventive health programs as well as maintaining high standards of living, clean water, and hygiene to achieve better health for all. In addition to granting women equal access to health care resources, Singapore has paid special attention to women's health care needs. One example of this is the provision of subsidized screenings for breast and cervical cancer.

Early Onset of Puberty

In recent years, an increasing trend of more girls growing breasts or pubic hair around the ages of six or seven has been reported. While no specific research has been conducted to ascertain the cause for the pattern, doctors have noticed a link between weight and the early onset of puberty. It is estimated that the phenomenon affects between 3 percent and 5 percent of young girls.

This issue is increasingly becoming a matter of concern in view of associated potential mental and physical health risks. For example, girls experiencing an early onset of puberty are likely to begin their growth spurts early and stop growing by the age of 12 or 13 instead of the normal growth until 16. Early onset of puberty results in longer lifetime exposure to the hormones estrogen and progesterone, which are known to feed some tumors and slightly increase the risk of breast cancer. In addition, there may be behavioral changes and social consequences associated with young girls' hormonal and bodily changes.

Tobacco Use

The smoking prevalence among Singaporean women is among the lowest in the world. Based on available statistics, the percentage of female smokers in the age group of 18–29 years who smoke daily was 6.5 percent in 2013. The most common form of tobacco product in Singapore is cigarettes, followed by cigars, roll-your-own cigarettes, and *shisha* smoking (which is smoking from a water pipe with partially burned flavored tobacco).

Maternal Health

The death of a mother during childbirth is relatively rare in Singapore. In the *State of the World's Mothers 2015* report, published by Save the Children, based on statistics on the health of mothers, Singapore ranked 14th out of 179

countries. It was reported that the lifetime risk of maternal death is only 1 in 13,900 (Mother's Index 2015). The rate is so low because obstetricians in Singapore are equipped to identify and appropriately treat mothers who are at risk of maternal death during pregnancy or at the time of childbirth and improved antenatal care is available at Singapore hospitals.

Postpartum depression is prevalent among a significant number of new mothers. Research suggests that around 8 percent of new mothers develop postnatal depression; however, it is believed that there may be more who do not get diagnosed and treated.

Breastfeeding initiation is high among new mothers in view of the widespread awareness of the benefits of breastfeeding for the baby. In a study conducted in 2013, it was found that 96 percent of new mothers left the hospital breastfeeding, with 50 percent of infants being exclusively breastfed. After 2 months, 80 percent of the mothers were still breastfeeding, with around 28 percent exclusively breastfeeding. At 6 months, around 42 percent of the infants were receiving some breast milk, and only 1 percent were exclusively breastfed. The most common reasons for stopping breastfeeding were the inability to supply enough breast milk, the need to return to work, and the baby not being able to suck well.

To overcome these breastfeeding barriers, a number of initiatives are currently working in Singapore. Some hospitals have initiatives that provide training to all maternity ward staff and provide breastfeeding counseling and consultation to mothers. Further, employers are encouraged to support their female employees to continue to breastfeed after returning to work.

Diseases and Disorders

In view of advancements in health care facilities and the ease of access to them, the life expectancy of Singapore residents has continued to rise. According to the Department of Statistics, "a girl born in 2014 is expected to live an average of 84.9 years, longer than 80.5 years for a boy born in the same year. At age 65 years, females could expect to live another 22.2 years, longer than 19 years for males" (Department of Statistics 2015).

Heart disease and stroke combined is the number one cause of death for women. The top five leading cancers for females during 2010–2014 were breast, colorectum, lung, corpus uteri, and ovarian cancer. Since 2010, doctors have also reported that the number of local women who seek

medical attention for sexual health issues has increased 500 percent.

Employment

Women comprise a sizeable portion of the participating labor force in Singapore. The *Yearbook of Statistics Singapore 2016* reports that the female resident labor force participation rate in 2015 was 60.4 percent, compared to the male resident participation rate of 76.7 percent. This is an upward trend from 54.3 percent in 2006. One of the factors for this upward trend is believed to be the greater availability of flexible work arrangements for better work-life integration.

The majority of the participating female labor force was 25–39 years old: 89.7 percent of 25–29-year-olds, 83.9 percent of 30–34-year-olds, and 81.7 percent of 35–39-year-olds. The age group of 75 years and above saw the lowest participation rate, 5.5 percent, followed by the age group of 15–19 years, at 13.1 percent. Further, a majority of the female resident labor force were either single or married. There was also a reasonable portion of divorcees.

Typical Jobs and Careers

In 2015, women mainly worked in the services sector, with majority holding positions of associate professionals and technicians, followed by clerical support workers, professionals, and service and sales workers.

Discrimination and Income Disparity

Despite a positive upward trend in the employment rates of women, certain gender gaps are still believed to exist. For example, some women are still not paid the same as their male counterparts in the workplace. Based on information made available in the 2015 Labor Force Statistics, women earn less compared to men in all occupational categories except in clerical and support jobs.

Further, although the same number of women as men enters tertiary institutions, women typically quit working in their thirties due to child-rearing and caregiving responsibilities. The 2015 Labor Force Statistics reported that 184,700 female residents in the 25–54 age group were out of the labor force, of which 79.6 percent cited family responsibilities (housework, child care, and caregiving to family and relatives) as the main reason.

It must also be mentioned that although women are still underrepresented at senior management levels, there has

been improvement in recent years. The Diversity Action Committee reported that the number of directorships (board seats) held by women rose 10 percent to 448 in 2014 from 406 in 2013. In this regard, the media industry is notable, as it showed a significant 16 percent in women directorships, the highest representation of women on boards. For the remaining industries, female representation ranged between 6 percent and 11 percent. Further, 8.8 percent of companies listed on the Singapore exchange had women on their boards in 2014.

Maternity Leave

Working mothers are entitled to either 16 weeks of government-paid maternity leave or 12 weeks of maternity leave, depending on whether the child is a Singapore citizen and other criteria. It is also noteworthy that pursuant to a shared parental leave scheme, working fathers, including those self-employed, are permitted 1 week of their wife's paid maternity leave with her agreement and for utilization before the child is 12 months old. This scheme assists fathers in caring for and bonding with a newborn baby, and it also allows the new mother to rest.

Family Life

The Singapore government places significant emphasis on the value of a strong family life. In 2015, on the Chinese New Year, Prime Minister Lee Hsien Loong urged "Singaporeans not to overlook the importance of strong families and their role as the bedrock of Singapore society" (Straits Times 2015). The government has also taken several steps to foster familial ties among Singaporeans, for example, by introducing targeted housing grants that encourage three-generation families to stay close by, issuing incentives to couples to have more children, and launching support schemes for low-income elderly persons.

Marriage

The Women's Charter of 1961 regulates marriages among Singaporeans (excluding Muslim marriages, which are governed by the Administration of Muslim Law Act.) The Women's Charter makes polygamy illegal. It recognizes equal rights and duties of both husbands and wives in the management of the home and children and makes it mandatory for a husband to financially support his wife and children during marriage and after divorce. The Women's Charter entitles the divorced husband or wife to a share

of matrimonial assets and empowers a battered spouse to gain protection from the perpetrator. It also sets out punishment for offenses against women and girls.

For Muslims, Islamic law prevails over civil law in matters of marriage, divorce, guardianship, and inheritance. Muslim men are permitted to practice polygamy, and Muslim women do not have the benefit of all the rights and protections provided by the Women's Charter.

Based on available statistics, 28,322 marriages were registered in 2015 under the Women's Charter and the Administration of Muslim Law Act. In addition, there were 29 re-registered marriages (civil marriages that were contracted overseas or under religious and customary rites and were subsequently registered in Singapore). The general marriage rate for females was 41.1 marriages per 1,000 unmarried females aged 15–49 years, which was slightly higher when compared to 40.8 marriages in 2014. There was a shift toward later marriages. Among the total marriages, slightly over three-quarters were first marriages for the couple. The median age at first marriage for women was 28.2 years and 37.5 years at remarriage. In 38 percent of first marriages, the couples were of the same age or just a year apart. The median age of women was higher across all educational groups—secondary and below, post-secondary, and university (Department of Statistics, 2015).

In 2015, 21.5 percent of the total marriages were interethnic, up from 14.9 percent in 2005. An upward trend among grooms marrying brides with the same or higher educational qualifications has also been noticed.

Contraception

The use of contraceptives is common among women. The estimated contraceptive prevalence among married or in-union women aged 15–49 years in 2015 was 66 percent (United Nations 2015).

Divorce

There has been a very slight increase in the number of divorces in recent years. The divorce rate among females rose from 6.5 percent in 2014 to 6.6 percent in 2015. For female divorcees, 32.3 percent were aged 25–34 years, and 27.5 percent were aged 45 and over. The median age for female divorcees was 38.8. The median marriage duration for divorces was 10 years. In marriages under the Women's Charter, 59.9 percent of the female plaintiffs cited unreasonable behavior of the spouse as the main reason. Female plaintiffs accounted for 69.1 percent of the Muslim

divorces in 2015, and infidelity or extramarital affair of the spouse accounted as the primary reason.

Counselors have reported that a diminishing social stigma attached to divorce and a lack of tenacity to make things work out between the couple are some of the factors that have led to divorce. Further, it is believed that the level of marital satisfaction tends to drop as couples take on their new roles as parents and no longer feel as important in the marriage or feel they do not have enough support from their spouse.

The Woman's Charter also permits invalidation of marriage, or annulment. Annulment means that parties whose marriages have ended are conferred the status of never having been married. In 2015, 405 couples annulled their marriage under the Woman's Charter. The median duration of marriages was two years.

Household Roles and Responsibilities

The Women's Charter requires marriage partners to cooperate with each other in safeguarding the interests of the marital union and in taking care of the children. The running of the matrimonial household is the shared responsibility of the husband and wife, although it is not clear how the government will enforce this. As a result, women continue to bear more responsibility for housework and child care. This has become a double burden for working women in cases where couples cannot afford domestic help.

Pursuant to amendments passed to the Women's Charter in early 2016, a woman is also legally obliged to provide for her husband or ex-husband in cases where he is unable to work because of disability (physical or mental) or illness.

Fertility

Singapore struggles with one of the lowest fertility rates in the world. These rates are based on the average number of children that are born to a woman who completes her childbearing years. The government has actively pursued baby-making incentives for couples, including cash bonuses and grants, subsidizing the cost of fertility treatments, child care subsidies, and parenthood and child care leave. There were 33,793 Singaporean babies born in 2015. It is possibly the highest number of births since 2002. However, the number was below the replacement rate of 2.1 to maintain population levels.

The main reasons for a low fertility rate are women marrying late, worries about the high costs of raising kids, and

worries about the economy. As more women focus on their studies and careers, they delay marriage and parenthood plans. The median age of a first-time bride has changed from 23.1 in 1970 to 28.2 years in 2015. Those who marry after 30 are unlikely to have large families.

LGBT Rights

Singapore does not recognize marriages, civil unions, or domestic partnerships of same-sex couples. Postoperative transgender persons are allowed to marry a person of the opposite sex. The adoption of children by same-sex couples is not legal. There is a statutory ban on consenting adult men who want to have same-sex relations. There are no laws specifically protecting LGBT Singaporeans from discrimination. No statistics are available on how many LGBT people there are in Singapore or what percentage of the population they constitute.

Politics

Participation in Government

Women are underrepresented in the political leadership of the country. The first two women ever elected in Singapore were Mrs. Robert Eu and Ms. Amy Laycock, in 1949, into municipal councils, followed by Mrs. Elizabeth Choy and Mrs. Vilasini Menon into the Legislative Council in 1951. There are currently 22 women in Parliament out of a total of 92 seats, which makes it lower than the 30 percent threshold recommended by CEDAW.

In 2013, Madam Halimah Yacob was appointed as the first female Speaker of the Parliament. After the last general elections in September 2015, Grace Fu was appointed as the Culture, Community, and Youth Minister. She is the first female full minister to helm a ministry and the first woman to be appointed Leader of the House.

Judicial System

Women judges have served in the high court since 1991 with the appointment of Lai Siu Chiu as a judicial commissioner. This led to a change in the mode of address from the tradition “My Lord” to the gender neutral “Your Honor.” However, it was only in 2015 that Judicial Commissioner Hoo Sheau Peng became the first woman to hear criminal cases in the high court. Justice Judith Prakash has become the first woman to be appointed as a permanent judge of the Singapore Court of Appeal as of August 2016.

Women’s Associations, NGOs, and Nonprofits

There are many women’s rights organizations and non-profit organizations that work for the protection and advancement of girls and women. The Singapore Council of Women was formed in 1952 under the leadership of Shirin Fozdar and Zahara Noor Mohamed. The council fought for the advancement of women’s rights and was instrumental in ending the practice of polygamy.

The Singapore Council of Women’s Organizations was set up in 1978, and the Association of Women for Action and Research was founded in 1985. Both organizations are key advocates and guardians of women’s rights in Singapore. They are involved in lobbying for changes in legislation and research on various topical women’s issues. Kanwaljit Soin, Constance Singam, Claire Chiang, Braema Mathi and Anamah Tan are some of Singapore’s feminist voices that continue to be active.

Armed Forces

The Singapore Armed Forces (SAF) has been aggressively recruiting women over the last few years. The SAF recruited its first women combatants in 1986. There are currently about 1,500 uniformed women in the armed forces, which amounts to 7 percent of SAF. Every year, about 60 women join the army, and the highest recruitment in recent years was recorded at 140 in 2014. In 2015, Col. Gan Siow Huang became the first female brigadier general in SAF.

Religious and Cultural Roles

The role of women in religion in public space in Singapore is a simple yet effective example of how religion can play a transformative role in public life. The current Speaker of Parliament in Singapore, Madam Halimah Yacob, is a hijab-wearing Muslim. She comes across as fair and impartial, with a particular concern for those on the margins. She proposes no Islamic teaching in her public role. (Athyal 2015).

Issues

Domestic Labor, Housemaids, and Helpers

Many families employ female migrant domestic workers from Indonesia, the Philippines, China, Nepal, and Myanmar to take care of children and the elderly at home and to do domestic work. There is a lack of adequate protection of rights for such women. The long hours of work, lack of legal rights of domestic workers, and exploitative

recruitment systems make female migrant workers vulnerable to abuse. In a 2005 report by Human Rights Watch (HRW), almost two-thirds of workers surveyed were subject to various forms of physical and psychological abuse: for example, repatriation threats, constant name-calling, deprivation of food and sleep, forced confinement, violent beatings, scalding, sexual harassment, and assault. In 2014, 26 cases of abuse were registered in the local courts, which was a sharp increase from 14 cases in 2012.

Discriminatory policies also impact the reproductive health of migrant women. For instance, as a public health measure, all work pass holders are required to undertake regular pregnancy tests. Contrary to CEDAW obligations, pregnancy results in the termination of employment and subsequent deportation. The cost of abortion and fear of authorities being notified cause some domestic workers to access self-administered, dangerous abortion drugs. Fear of deportation combined with a total dependence on one's employer to cover all medical expenses also affect a worker's decision to report any abuse, let alone access reproductive and sexual health services.

Trafficking and Prostitution

Singapore is a destination country for women and young children from Bangladesh, Indonesia, the Philippines, Thailand, China, Sri Lanka, and Timor-Leste. Many of Singapore's labor force are vulnerable to trafficking; most victims willingly migrate for work in the construction, domestic service, performing arts, manufacturing, or service industries or in the sex trade. Social workers have found that many domestic workers from Cambodia and Burma, who experience language barriers and lack access to mobile phones, become isolated and vulnerable to trafficking.

Foreign women sometimes enter Singapore to work in the sex industry, but upon arrival, they are coerced into prostitution under the threat of serious harm, including financial harm. There are cases of child sex trafficking in Singapore, involving boys and girls, and cases of Singaporean men engaging in child sex tourism in other countries.

In September 2015, Singapore acceded to the UN Protocol to Prevent, Suppress and Punish Trafficking in Persons, especially Women and Children (UN TIP Protocol), and in January 2016, it ratified the ASEAN Convention against Trafficking in Persons, Especially Women and Children (ACTIP).

The domestic legislation, Prevention of Human Trafficking Act (PHTA), came into force on March 1, 2015. It

formally defines human trafficking for purposes of sex, labor, and organ removal and empowers specialist officers to investigate cases. First-time offenders of trafficking face a mandatory fine of up to \$100,000 and a jail term of up to 10 years, plus the possibility of up to six strokes of the cane. The law is transnational in nature, and anyone who facilitates the offense can be charged under it. It also provides for the victims to receive shelter, counseling, translation, and legal assistance. While legal cases against their traffickers are ongoing, victims will be allowed to continue working in Singapore.

Since the PHTA came into force, authorities have identified 33 victims and initiated 11 prosecutions in 4 cases. In February 2016, in the first case to be prosecuted under PHTA, a 25-year-old man was sentenced to 75 months in jail and fined SGD\$30,000 (close to USD\$22,000) for sexually exploiting at least two teenage girls and forcing them into prostitution.

South Korea

Overview of Country

South Korea, also known as the Republic of Korea, is a country on the Korean Peninsula that is separated from

North Korea (also known as the Democratic Republic of Korea) by a heavily militarized border, the Korean Demilitarized Zone (DMZ). South Korea also borders the Korea Strait, the East China Sea, the Yellow Sea, and the Sea of Japan, also known as the East Sea. South Korea has nine provinces, which include Cheju-do, Chollabukto, Cholla-namdo, Ch'ungch'ong-bukto, Ch'ungch'ong-namdo, Kangwon-do, Kyonggi-do, Kyongsang-bukto, and Kyongsang-namdo. In addition, South Korea has seven metropolitan cities: Inch'on, Kwangju, Pusan, Seoul, Taegu, Taejon, and Ulsan.

South Korea is 37,421 square miles of land and 1,081 square miles of water. The majority of the land is mountainous. The lowest geographic point in South Korea is the Sea of Japan, at zero feet. The highest geographic point in South Korea is Mount Halla-san, at 6,398 feet. The main sources of water for the country are four major reservoirs, which include the Paldang, Mulguem, Daechong, and Juam reservoirs (WEPA n.d.). The largest city and the capitol of South Korea is Seoul.

While Korean is the official language of South Korea, English is generally exclusively taught in junior high school and high school (Wong 2013). The country is largely composed of the Korean ethnic group. In 1948, South Korea officially declared independence from the U.S. military government (History.com Staff 2009).

The life expectancy of South Koreans is 82.4 years, with women's life expectancy at 85.8 years and men's at 79.3 years. South Korea's World Life Expectancy ranking is 12th. The adult literacy rate, starting at age 15 and above, is 99.2 percent (CIA 2017). The Gender Gap score for equality is 0.651, where 1.0 is complete equality and 0.0 is complete inequality (WEF 2015). In 2014, the UN Development Programme (UNDP) ranked South Korea 17th out of 187 nations. South Korea ranked 23rd on the Gender Inequality Index (UNDP 2014). A lack of data means South Korea does not have a reported Multidimensional Poverty Index (UNDP 2015). Women make up 42.8 percent of the total population (CIA 2017).

In terms of ethnicity, Korea has long been regarded as an ethnically homogenous country. However, the percentage of foreign nationals has rapidly increased with the impact of globalization. More than 97 percent of the residents speak Korean and have Korean ethnicity; 2.7 percent of the population consists of foreign nationals, and about half of them are migrants from China who have Korean ethnicity and Chinese citizenship. There are 141,654 marriage migrant women who comprise 11.2 percent of the

foreign residents living in South Korea. In addition, there are currently 28,500 U.S. military personnel stationed in South Korea as well as 43,000 English teachers from English-speaking countries. In this sense, women's lives and experiences in South Korea should be regarded in a broad sense, as South Korea is an increasingly multicultural society in terms of region, religion, ethnicity, age, and other factors.

South Korea's economy has grown over recent decades. South Korea has gone from having a gross domestic product (GDP) per capita of USD\$64.00 after the Korean War to GDP per capita of USD\$27,531.81 today. As a result, South Korea is a leader in the G20 economy. While Korean politics have prioritized increasing South Korea's economy, issues related to gender and human rights have been deprioritized. For instance, in 2013, South Korea's Global Gender Gap ranking dropped to 111th out of 136 countries (WEF 2013). In 2015, South Korea's Global Gender Gap ranking was 115th out of 145 countries. The 2015 Gender Gap Index reports South Korea's women in Parliament was ranked 101st out of 145 countries. In addition, women in South Korea's ministerial positions ranked 130th out of 145 countries (WEF 2015). However, in 2013, South Korea elected its first female president, Park Geun-hye (Ramirez 2016), a milestone that many South Korean feminists and progressive activists argue is not necessarily positive, as Park Geun-hye is the daughter of the previous dictator Park Jung Hee, and her government's policies are notably conservative.

Girls and Teens

A typical day for teens in South Korea is to end the school day at 4:00 p.m., followed by private lessons and study halls that can last until 11:00 p.m. or later; 77 percent of South Korean teens follow up school with private lessons for an average of 10 hours a week (Choi 2016). Overall, teens spend an average of 14 hours a day in efforts toward achieving their educational goals (Hu 2015a). Teens in South Korea reportedly sleep an average of 5.5 hours a night (Koo 2014).

Every November, teens prepare for a college entrance exam known as the *suneung*. This test is so important that the South Korean government attempts to keep airplanes grounded on this particular testing date so as not to disturb the students. Ultimately, the results of the *suneung* determine which colleges students may attend, which many believe ultimately determines their future job and career paths (Hu 2015a).

South Korean teens 11–15 years old, compared to 30 other nations, have reported the highest amount of stress. Furthermore, the Organization for Economic Co-Operation and Development (OECD) reported that half of the teens in South Korea have stated they face high levels of daily stress from school. Because of these societal pressures, many South Korean couples have decided to not have children (Hu 2015a).

For Korean students, the pressure to excel in every subject is high. As a result, suicide is unfortunately the leading cause of death among teens. For 11 years in a row, South Korea has been ranked first in the world for having the highest suicide rate among OECD countries. While the overall suicide rate has decreased since 1985 among OECD countries, since 2000, the suicide rate has been increasing in South Korea (*Korea Times* 2015). A study from Samsung Medical Center conducted in 2008–2012, which surveyed 129,000 South Korean teenagers, reported 60 percent of gay and lesbian teens had suicidal thoughts, and 75.5 percent of gay and lesbian teens had consumed alcohol. The study found that there was a correlation between gay and lesbian teens and the behavior health risk of suicide (Cooke 2016). Furthermore, South Korea faces a spike of suicide rates during exams that are administered for students to be admitted to colleges (Dempsey 2015).

To address suicide, in March 2016, the Korean government adopted and will begin implementing a five-year plan focused on mental health. The mental health plan's primary objective is to address the high suicide rate in South Korea (Umeda 2016). In addition, South Korea has developed an application to combat teen suicide. The application detects when teens use phrases or words that relate to suicide on social media. When the application does detect suicidal phrases or words, it sends an alert to their parents (Dempsey 2015).

One significant issue for teens in South Korea is bullying, or *wang-tta*, which includes the act of singling out one person in a group to bully and ostracize (Chee 2006). The Korea National Youth Policy Institute defined *wang-tta* as the group behavior that uses verbal and physical violence against one person in a group for more than two weeks. Almost 11 percent of primary school students, 5.6 percent of middle school students, and 3.3 percent of high school students report that they have experienced bullying more than once.

Experts believe that the competitive and oppressive atmosphere of classrooms causes the bullying culture. In other words, students who are not recognized by teachers

and parents within the competitive school system tend to express their anger by bullying other students. Some researchers believe that the collectivism and groupism of Korean culture is another major reason for the teens' bullying behavior. The bullying culture along with the standardizing and collective principle of the South Korean school system creates a violent environment, especially for minority students. Lesbian, gay, bisexual, transgender, and queer (LGBTQ) teens as well as ethnically marginalized students often suffer hardships in their school lives.

Girls' sexual desire is not socially approved in South Korea. Girls' sexuality is commonly understood through a protectionist perspective. At the same time, however, because of consumerism and a large sex industry, women's and girls' sexuality is often commodified, and girls in South Korea face a double bind for their sexual practices. As students, teen girls are expected to study hard and be sexually "innocent," but they are sexualized in the market and within their own subculture. Although sexual practice is common for many teens and girls, girls' sexual desire is not approved of nor recognized by their teachers and parents. In this context, teen girls who experience pregnancy or childbirth suffer conflicts with the social norms as well as great stigma (Kim 2010).

Meanwhile, although school is a significant space for most of teens' lives in South Korea, not all teens belong to the school system. There has been increasing number of teenagers who are not provided proper care and education from home and schools because of the collapse of middle-class families in a neoliberal economy. Scholars argue that those teens in "new poor" households lose motivation and dreams for future lives and tend to depend on short-term relationships on the street or the Internet. Girls in these situations often use short-term relationships to earn money and to foster their lives on the street. In other word, girls from the new poor and poor families begin to learn how to utilize their sexuality as a resource to survive (Min 2009).

Education

The Japanese occupation of South Korea from 1910 to 1945 devastated the literacy rates in Korea. Upon the Japanese leaving South Korea, the literacy rate in 1945 was 22 percent (Wong 2013), but illiteracy had decreased by the mid-1960s (COIEB 2015). By the 1970s, South Korea's literacy rate was 87.6 percent. Today, South Korea's literacy rate is 97.9 percent. South Korea's literacy rate for females

is 96.6 percent, and for males, it is 99.2 percent. Although literacy rates are high for the country, there is a 3 percent difference between the literacy rates of females and males (Wong 2013).

In 2009, the Program for International Student Assessment (PISA) measured 15-year-old South Korean students in reading, mathematics, and science literacy skills. The PISA ranked South Korea second in reading, fourth in mathematics, and sixth in science literacy skills (COIEB 2015). In South Korea, 93 percent of high school students graduate on time (Lynch 2016).

Education has been associated with the country's economic growth. As a result, in two generations, South Korea has increased its literacy rates and economic standings. For instance, South Korea has raised its percentage of high school graduates from 37 percent out of 36 countries to 97 percent, according to the OECD (Lynch 2016). With the correlation of education and overall rise in GDP, South Korea places education at the forefront of governmental policies (Chakrabarti 2013).

Achieving educational success is often linked to socioeconomic status. South Koreans perceive education as a means to achieve upward social mobility. The goal for students in Korea is to produce positive outcomes, be obedient, and excel in performance. Successfully achieving these goals means attending one of the three best universities in South Korea: Seoul National University, Korea University, or Yonsei University, together known as "SKY" universities (Calonge 2015). Students hope to study at one of the SKY universities or to attend a top university in the United States or elsewhere (Coonan 2014).

South Korea averages 17 years of school per individual. Females usually attend 12 years total of primary, middle, and secondary education followed by four years of postsecondary education. The total schooling on average for females is 16 years. Males usually attend 12 years total of primary, middle, and secondary education followed by 2 years of mandatory military service, which needs to be completed between the ages of 18 and 35 (Wong 2013). Many men who complete 2 years of postsecondary education also complete mandatory military service and then complete the remaining 2 years of postsecondary education (Enthoven 2013).

For girls and teens, South Korean culture perceives their role as burgeoning scholars. Girls and teens in Korea receive an excellent education that encourages them to achieve high levels of schooling. South Korea's education system uses textbooks that promote gender equality,

which furthers the success levels women achieve in adulthood. For instance, women achieve high levels of education and perform well on standardized tests (Shim 2015); however, Korea's educational materials perpetuate stereotypical roles of women as having a duty to also perform housework.

Until recently, universities banned women from getting married and having children while attending a university. This is because education has been perceived to take precedent over marriage until the completion of the degrees. If a student had a child while attending a university, she was forced to leave school. On February 9, 2016, South Korea's Education Ministry revised this law to no longer ban women from getting married and having children while they are university students. The revised law will now allow students to take time off to care for their child or children while also earning their degrees (Matthews 2016).

Health

Access to Health Care

With the increase of development and industrialization from the 1960s to the 1990s, South Korea began to work toward being able to set up a health care system. By 1989, all South Koreans had access to health care. Today, South Koreans have access to health care under the National Health Insurance (NHI) system (Yang 2008).

Maternal Health

In South Korea abortions are illegal except in instances of incest, rape, severe genetic disorders, or when the mother's health is jeopardized. In these limited instances, an abortion must occur by the 24th week of pregnancy. If a woman does not abide by this law, she and her physician may be detained, charged, arrested, prosecuted, convicted, and required to pay penalties (Rife 2016). Because of South Korea's abortion law, 80 percent of women between the ages of 18 and 44 use contraceptives (CIA 2017).

In 2016, South Korea's infant mortality rate was 3 per 1,000 live births (CIA 2017). The birth rate in 2016 was 8.4 live births for every 1,000 lives. The average age that women give birth to their first child is 31. The average fertility rate is 1.25 children born for every South Korean woman (CIA 2017). Overall, South Korea provides adequate maternal health care.

Diseases and Disorders

South Korea was the first country diagnosed with cases of Middle Eastern Respiratory Syndrome (MERS) and endured the largest outbreak of MERS (Kaplan 2015). MERS affects the lower respiratory system. Over a third of Koreans who were diagnosed with MERS have died. MERS is a type of coronavirus that is comparable to severe acute respiratory syndrome (SARS). MERS spreads through close human contact with saliva or respiratory secretions. In December 2015, South Korea was declared MERS-free (Normile 2015).

Employment

South Korea has one of the highest rates of unemployed women. While women work outside the home in their early twenties, many opt out of paid employment in their thirties. When Korean women reach their thirties, they stop working outside of the home because of cultural constraints placed on women. For instance, Korean culture praises women for achieving high levels of educational success because this means women will find a marital suitor who will match their educational success. This understanding sustains Korean women's primary roles as wives and mothers (Kwon 2014).

The OECD reported that, out of 30 countries, South Korea had the lowest number of female executives. Furthermore, OECD reported that among corporate executives in the 500 largest businesses in South Korea, only 2.3 percent had women executives. However, despite these numbers and cultural expectations, South Korea is working to empower women in the workplace. For instance, in 2012, Lee-Pu-jin became the first female president of Samsung Company (Chun 2013). While South Korea is working to improve the number of female executives, it also has low participation of women on corporate boards. Only 0.4 percent of corporate board members are women. Samsung Electronics has a total of 48 women board members, translating to women making up 4 percent of the total board members (Sung-jin 2016).

While some women work as executives or corporate board members, other women work within the sex industry. Since 1945, when the United States occupied Korea, the sex industry in South Korea has become pronounced with the boom of camptowns. In particular, after the 1953 Korea-U.S. Mutual Defense Treaty, 18 new camptowns were established. The livelihood of many Koreans depended on camptowns and the sex industry. For instance, by 1958,

there were an estimated 300,000 sex workers in South Korea. More than 150,000 of those sex workers were in camptowns. Since the mid-1990s, the number of women in sex work has dramatically decreased due to the increase in South Korea's economy and the expansion of jobs for women outside of sex work. Despite the lower numbers of women involved in sex work overall, sex work and prostitution continue to be prominent around U.S. military bases. Prostitution has undergone crackdowns by the South Korean government, and the United States has banned solicitation in the military. But sex work and sexual abuse are both still present in South Korea (Vine 2015).

The current overall unemployment rate of those seeking employment is roughly 3–4 percent. More specifically, the unemployment rate for women seeking employment is 3.2 percent, and the unemployment rate for men seeking employment is 3.9 percent. With a 3.9 percent unemployment rate, an underutilization indicator predicted unemployment at 12.5 percent. The unemployment rate for men is slightly higher than for women, which may be partly due to the two-year military service required for men. Furthermore, there is a possibility South Korea's unemployment rate does not account for students who graduate and take part-time jobs (Lee 2015).

While many women have been able to find employment in South Korea, gender inequality remains rooted in South Korea's workforce. According to the OECD, out of 35 countries, women earn 37 percent less on average than men in South Korea, which is the largest gap of averages between women and men among the countries analyzed (Ramirez 2016).

Family Life

Neo-Confucianism has been a crucial ideology organizing the hegemonic family structure of South Korea. According to the Neo-Confucian principle, because family is a core and micro unit of the larger society, each family member's adherence to strict gender roles and responsibilities has significance in terms of constructing a stable and harmonious society. Traditional rituals, ethics, and values for the South Korean family system have been constructed in a gendered way under the strong influence of Neo-Confucianism. In the Neo-Confucian patriarchal family structure, wives generally occupy a lower position than their husbands, and the oldest male in the household has the most powerful authority and leadership. Once a woman

is married, it is assumed that she leaves her biological family to enter the paternal kinship line of her husband.

According to the Neo-Confucian principle, female family members' roles and responsibilities are limited to the private sphere, while male family members are in charge of supporting the family by working in the public sphere. According to this system, female family members' power and honor can only be gained through their roles as mothers and mothers-in-law. There are numerous Neo-Confucian-inspired sayings that imply the gender inequality of the traditional Korean family system, including, "A woman should look on her husband as if he were Heaven itself, and never weary of thinking how she may yield to him"; "There are three unfilial acts: the greatest of these is the failure to produce sons"; "A husband can marry twice, but his wife must never remarry"; and "If a hen cries in the house, the house will be ruined" (Women in World History 2013).

Alongside the influence of Neo-Confucianism, Korean women's family lives also have been transformed by socioeconomic factors. Since the 1960s, the government-led compressive economic development and rapid industrialization have allowed South Korean women to attain civic rights and social status to some degree. However, feminist scholars believe that the industrialization and economic growth of postwar South Korean society did not actually improve women's lives within the family system. During the industrialization, women still had to carry out the traditional gender role as housewives, although many women also became wage laborers. Although most working married women have had to be in charge of both the care work in the private sphere and wage labor in the public sphere, it is often believed that the increase in women's employment implies an improvement of women's social status. Meanwhile, full-time housewives also experienced changes during the industrialization and urbanization period. Unlike the traditional rural community life, which allowed women the benefits of communal child care and cooking, modernization led to nuclear families in urban apartment complexes, resulting in increased isolation of middle-class housewives and more psychological dependence on their husbands (Chung 1995).

Meanwhile, since the 1997 International Monetary Fund Crisis, South Korean society and economy have rapidly neo-liberalized. Although the traditional heterosexual marriage ideology has persisted, the socioeconomic shift of Korean society has shaped new cultural perceptions of gender roles and gender relations within the hegemonic heterosexual family system and has also influenced the

diversification of household types and family experiences of women in South Korea.

During the economic crisis, a great number of male middle-class breadwinners lost their jobs, and their full-time housewives had to find employment to support their households. While before the financial crisis there was a strong belief in the dichotomy, “male breadwinner and female housekeeper,” the economic crisis shifted women’s and men’s views on women’s work and the importance of their economic contributions to their households. For lower- and working-class women, the financial crisis was even harder. More women workers than male workers lost their jobs because women were not assumed to be breadwinners of their households, despite the fact that working-class women have always sustained their households. Although a large number of married women earn income for their households in contemporary South Korean society, it is challenging to achieve family-work balance for both middle- and working-class women (Kim and Finch 2002).

One crucial gender role of women in the modern Korean heterosexual family is the education of children. Educating one’s children is regarded as a significant part of mothering. Many Korean mothers passionately manage the education of their children, and stay-at-home mothers often find part-time employment just to cover the costs associated with private education. Also, an increasing number of middle- and upper-middle-class households decide to become what are referred to as “*kirogi* families,” in which the mother lives with the children in an English-speaking country to manage her children’s education, while the father remains in South Korea to earn income and send money to them abroad (Choi 2006).

Meanwhile, in the contemporary neoliberal economy, marriage often does not serve as a gendered path toward economic dependence for many women because the breadwinner model no longer functions for most households in a neoliberal economy. The increase of non-traditional households, such as one-person households, single-mother-headed households, and the households of unmarried couples and lesbian, gay, bisexual, and transgender couples and families, implies that the traditional patriarchal family system has been challenged with the changing socioeconomic situation.

Due to the increase of employment flexibility, many Korean men in their twenties and thirties avoid marriage because they believe that they are not ready to be the breadwinner of a household. Meanwhile, an increasing number

of educated women tend to avoid marriage as well because they do not want to take on the double burden of domestic work and wage labor. In 2012, the average marriage age was 29.6 for Korean women and 32.2 for Korean men. In 2012, more than 50 percent of Korean men born between 1976 and 1980 were single, and about 30 percent of Korean women in the same age group were single (CIA 2017).

South Korea also has a very low birth rate. In 2009, South Korea’s birth rate was 1.23. High private education expenses, lack of social nursery facilities, and the late-marriage tendencies of both men and women are considered the main reasons for South Korea’s low birth rate (Son 2005, 327). Thus, women’s reproduction has been an object of governmental policy implementation, and there have been various social policies and campaigns to encourage childbirth. However, feminist scholars have been critical of such policies, arguing that the governmental projects objectify women’s bodies and reproduction as tools for national prosperity.

Politics

From 1945 to 1948, the U.S. Army Military Government in Korea (USAMGIK) ruled over South Korea. In 1948, South Korea officially declared independence from the U.S. military government. The first president of South Korea was Syngman Rhee. On June 25, 1950, the Korean War began between North Korea and South Korea. North Korea was backed by the Soviet Union, and South Korea was backed by the United States. The war occurred over the boundary line between the two states, which is known as the 38th parallel. The Korean War lasted until 1953 and resulted in 5 million people dead and more than 100,000 Americans wounded (History.com Staff 2009). Every major city in South Korea was destroyed during the war, and the resulting militarization and U.S. military bases continue to have consequences for local communities today.

Syngman Rhee was well-known as an anticommunist. In 1960, he was reelected to serve as president for a fourth term; however, the opposition Democratic Party claimed that the election was fraudulent and that votes had been tampered with. As a result, protests erupted against Rhee’s fourth-term reelection, which caused Rhee to resign in April 1960. Shortly after his resignation, Rhee and his family were relocated to Hawaii by the U.S. Central Intelligence Agency (CIA) (Breen 2010).

Following Rhee’s presidency, the next 9 presidents were men, until the 11th president, Park Geun-hye, was elected

in 2013. Park was the first female president of South Korea and the first female head of state in East Asia. She was also the daughter of former South Korean president Park Chung-hee. Park appeared on Forbes list of the world's 100 most powerful women.

Some have argued that Park was elected because of her family ties and not because of a push in South Korea for gender equality. For instance, even after Park was elected, South Korea continued to have a low representation of women in politics. Only 17 percent of women are a part of South Korea's National Assembly. Because of the low representation of women in Parliament, the Inter-Parliamentary Union (IPU) ranks South Korea 111th out of 193 countries. Such low representation of women in politics is indicative of the region of Asia where there are only three women who currently serve as leaders of their respective governments: South Korea's President Park, Nepal's President Bidhya Devi Bhandari, and Bangladesh's Prime Minister Sheikh Hasina (Cohn 2016).

At the end of 2016, a longtime friend of Park's, Choi Soon-sil, was repeatedly requested to attend a number of committee hearings investigating corruption by Park. Choi refused to attend the hearings, and, as a result, she was taken to a detention facility and held. Parliamentary members decided to go to the detention facility, with cameras present, to speak to Choi. Eventually, Choi agreed to speak to eight members of the committee investigating Park, but only in a private meeting area without cameras for three hours. Choi denied colluding with Park for personal financial gain (Agence France-Presse 2016b).

During the committee's continued investigation, millions of South Koreans protested in opposition to Park's presidency. The protests were in response to presidential political corruption. Because of the protests, on December 9, 2016, Park Geun-hye became the first female president to be impeached by South Korea's Parliament. The Parliament requires at least 200 votes to impeach a president, and Geun-hye received 234 parliamentary votes in favor of impeachment (Everard 2016).

To fulfill Park's presidential responsibilities, Prime Minister Hwang Kyo-ahn has assumed the role as South Korea's acting president. At the time of this publication, the Constitutional Court is deciding whether to accept Park's impeachment or to restore Park's responsibilities as president. If the court decides to accept Park's impeachment, the South Korean presidential election will be moved up from December 20, 2017, to occur two months or 60 days after the court's acceptance. The court must decide on

Women's Voices

Han Myung-sook

Han Myung-sook was the first woman to serve as prime minister in South Korea, a position she held from 2006 to 2007. Like many women in leadership, she faced opposition and political retaliation for her work. In 2010, a district court acquitted her of accepting illegal political funds, doubting the reliability of the state's key witness, but a high court reversed that verdict and sentenced her to two years in prison. Han stated, "I declare honorably and squarely that I'm innocent." She added that she believes she is the victim of "political suppression" (AFP-JIJI 2015). She is an advocate for women's rights and was the first minister of gender equality and family in South Korea. In the 1970s, she was imprisoned for two years for her prodemocratization work. From 2003 to 2004, she was the minister of environment and was elected in both 2000 and 2004 to serve as a lawmaker in the National Assembly.

Park's impeachment motion by June 21, 2017 (Williams 2016). On May 10, 2017, Moon Jae-in won the majority of the public votes at 34% to be sworn in as president. President Moon Jae-in is serving a single five-year term with his presidential term ending in 2022 (Phippen 2017).

Because of Park's impeachment by the South Korean Parliament, a wartime sex slave dispute between South Korea and Japan has resurfaced. From 1910 to 1945, Japan occupied the Korean Peninsula, and during this time, Japanese military brothels forced anywhere from 50,000 to 200,000 Korean girls and women into sex slavery, or mass militarized and institutionalized rape by the Japanese military, under Japanese colonial society. In August 2015,

Japan's Prime Minister Shinzo Abe apologized for the historical exploitation of Korean girls and women known as "comfort women" by the Japanese military. Abe not only apologized but also worked out an agreement under the Park administration to compensate victims by creating a fund of 1 billion yen (USD\$8.6 million). Given that the agreement for compensation to victims was made under the Park administration, it may no longer be in good standing (Reynolds 2017).

The dispute with the Japanese government is not only for paid retribution, but also a statue of a Korean comfort woman. In 2011, local South Korean artists created and installed a statue of a Korean comfort woman across the street from the Japanese embassy in Seoul. The statue of a comfort woman in traditional Korean clothing, sitting in a chair, is situated to face the Japanese embassy. The comfort woman statue is a symbol of resistance to Japanese denialists who continue to reject that the Japanese military forced Korean girls and women into militarized sex slavery during Japanese occupation of South Korea. In December 2016, a similar statue was created and installed in Busan, South Korea's busy port city. The Busan statue is across the street from the Japanese consulate (Luu 2017).

The comfort woman statue has been politically controversial. It had not been solicited by the South Korean government. The Japanese government initially perceived the South Korean government to have commissioned the statue and requested the South Korean government to remove the statue. The South Korean government has not removed the statue for fear of public outcry. With Park's impeachment, the comfort woman statue has become even more controversial. For instance, in January 2017, Japan recalled two top diplomats from South Korea because of the most recent comfort woman statue in Busan (Kingston 2017).

While the Park administration made efforts to hold Japan responsible for historical trauma to South Korean girls and women, many of South Korea's women's groups fear that Park's presidency has actually made sexism worse in the country. A female member of South Korea's Parliament, Nam In-soon, has discussed the negative impact Park's impeachment has had on women in South Korea. Nam In-soon chairs the Parliament's Gender Equality and Family Committee and argues that Park's impeachment is being used by men as justification to argue that women are incapable of successfully serving as politicians in South Korea. Furthermore, if Park were successful as South Korea's president, her success would not have been

attributed to her being a woman. Rather, Park's success would have been attributed to having connections to her father, who served as a former president of South Korea. For South Korea's women's groups, Park's background made it so that she would inevitably fail as a trailblazer and potentially cause setbacks for South Korean women's representation in politics (Ramirez 2016).

Religious and Cultural Roles

Today, South Korea is a country that does not have a state religion and where a diversity of religions coexist peacefully. Religions in South Korea include Buddhism, Protestantism, Roman Catholicism, Confucianism, Jeungsanism, Cheondoism, Islam, and Shamanism. In 2005, 53 percent of the South Korean population reported having a religious affiliation. In 2005, of South Korea's religious population, 43 percent of people, or 10,726,000 individuals, identify with Buddhism; 34.5 percent of people, or 8,616,000 individuals, identify with Protestantism; 20.6 percent of people, or 5,146,000 individuals, identify as Roman Catholic; and 1.9 percent of people, or 483,000 individuals, identify as "other," which includes Confucianism, Won Buddhism, Jeungsanism, Cheondoism, and Islam (Department of Global Communication and Contents Division 2017). Today, roughly 46 percent of South Koreans report having no religious affiliation, 29 percent of South Koreans identify as Christians, and 23 percent of South Koreans identify as Buddhists (Connor 2014).

Issues

LGBTQI Rights

South Korea's cultural and legal standpoints on LGBTQI rights are complex. In 2011 and 2014, South Korea voted at the United Nations for Human Rights Council resolutions that called for an end to discrimination and violence based on sexual orientation and gender identity. Support for both resolutions was further echoed by South Korean political representative and the UN secretary-general Ban Ki-moon (Lewis and Gaffney 2015). However, South Korea is a traditional country that focuses on the collectivity of culture and people where heterosexual relationships remain the norm. Under Korean law, marriage is exclusively between a woman and a man. Such an understanding of the law functionally makes same-sex marriage illegal in South Korea. At the very least, same-sex marriage is not recognized. As a result, many LGBTQI South Koreans may pass

as heterosexual and may get married under South Korea's normative conception of marriage. Some LGBTQI South Koreans who pass as heterosexual may even start a nuclear family (Hyams 2015).

Despite South Korea's legal rejection of same-sex marriages, there are activist groups and individuals who have been challenging the status quo of exclusionary rights. In 2000, South Korean comedian and actor Hong Seok-cheon became an activist of LGBTQI rights after he openly came out as gay. Hong received criticism from the public and also his family for coming out, but his celebrity status has placed a spotlight on the issue of LGBTQI rights in South Korea. In that same year, 2000, South Korea held its first Korea Queer Culture Festival. The event celebrated the South Korean LGBTQI community with a film festival and a parade. The festival's intention was to not only celebrate the LGBTQI community but also to raise awareness for LGBTQI rights and acceptance. South Korea has continued to host the festival annually (*10 Magazine* 2017).

The Korea Queer Culture Festival has not occurred without disruptions. For instance, in 2014, the parade was stalled for a few hours by anti-LBTQI Christian protestors who lay down in the streets where the parade was to pass through. As protestors lay on the ground, they sang songs condemning LGBTQI rights. Protestors eventually left, and the parade was completed. Religious groups have also started to voice homophobic anti-LBTQI views as LGBTQI groups and activists have gained greater visibility. And the Seoul police department claimed that the 2014 Korea Queer Culture Festival was a disruptive nuisance event, which presented obstacles for the event's ability to be hosted in 2015 (Hu 2015b).

In 2015, a group called the Love Your Country, Love Your Children Movement, an anti-LBTQI Christian group, decided to camp outside of the Seoul police station to prevent organizers of the Korea Queer Culture Festival from entering the station to apply for a permit (Power 2015). Because of this and the previous year's homophobic protests, the Seoul police station refused to allow the Korea Queer Culture Festival to file for a permit for the event's annual parade. The parade and festival events had an expected attendance of 20,000 people (Hu 2015b). In response to the police station's refusal of a parade permit, 100 LGBTQI activists protested and camped out in front of the Seoul police station. After a week of camping out in front of the police station, the Korea Queer Culture Festival was finally able to submit an application for an event permit (Knight 2015).

The Seoul police station reviewed the application for the parade permit and rejected it because of potential counterprotests. In fact, an anti-LBTQI religious group's parade application had been submitted for the same date and time as the Korea Queer Culture Festival parade for that purpose. In response to the potential counterprotest, the police station rejected the parade's permit for fear of potential violence, but it officially cited rejection of the permit because the parade might inconvenience pedestrians. Activists appealed the police station's decision to a Korean court (Knight 2015). The court ruled that the Seoul police station had to provide the Korea Queer Culture Festival a permit for the parade (Feder and Lee 2015).

At the 2015 Korea Queer Culture Festival, tens of thousands of people marched in the parade and shut down attempts by anti-LBTQI Christian groups and protestors to halt the parade. Anti-LBTQI Christian groups initially predicted 30,000 people protesting against the parade. However, only 2,000 people protested against the 2015 Korea Queer Culture Festival (Feder and Lee 2015).

While LGBTQI groups and activists have gained greater visibility in recent years, a 2015 Pew Research Center survey found that 57 percent of South Koreans believe same-sex relationships are unacceptable. The same survey found that 18 percent of South Koreans believe same-sex relationships are acceptable (Hu 2015a). Furthermore, South Korean laws punish individuals for identifying as LGBTQI. For instance, the South Korean military mandates men to serve at least two years. Military members who identify openly as LGBTQI can face a maximum of two years of imprisonment (Kang 2015).

While there has been support for anti-LGBTQI laws, there has also been resistance to such laws. For instance, gay celebrity and film director Kim Jho Gwang-soo and his partner, Kim Seung-hwan, are a high-profile gay couple in South Korea. Kim is one of a few celebrities who is openly gay. In 2013, Kim and Kim Seung-hwan had an outdoor wedding ceremony in Seoul. In 2015, they decided to petition a South Korean court to allow the two men to legally be married. Kim and Kim Seung-hwan were denied their petition, which has resulted in their filing a lawsuit. They are the first same-sex couple to file a lawsuit over a petition for a marriage license. In the lawsuit, Kim and Kim Seung-hwan's lawyer, Ryu Min-hee, used an equal protection clause to justify the court striking down a family law that is discriminatory. Kim, Kim Seung-hwan, and their lawyer were hopeful that a Supreme Court decision in the United

States ruling same-sex marriage as constitutional would help them in winning their case (AFP-JIJI 2015).

In 2016, the court struck down Kim and Kim Seung-hwan's case. The couple's lawyer Ryu argued that the court should see civil law through a "gender-neutral" perspective to uphold equal rights for all in every instance. Chief Judge Lee Tae-jong of the Seoul Western District Court ruled that marriage cannot be between two individuals of the same sex, which upheld South Korea's legal assumption that marriage can only exist between a woman and a man. While LGBTQI identities are not illegal in South Korea, Korean culture maintains deeply conservative attitudes toward LGBTQI identities. Ultimately, while the decision was not what Kim and Kim Seung-hwan desired, they are hopeful that South Korea will one day uphold LGBTQI rights (Agence France-Presse 2016a).

Adoption within Korea and Transnational Adoption

In South Korea, adopting children within the country is considered taboo. This cultural norm stems from cultural understandings of adoption as decreasing familial status and lacking a connection to familial bloodlines. Familial bloodlines are rooted in the status of knowing one's history. The importance of bloodlines is particularly associated with Confucianism's emphasis on familial ties and collectivism. In addition, when Koreans apply for jobs, individuals can request information about family registry from those seeking employment. In the U.S. experience, recommendations from former employers is important, but in South Korea, the status of family bloodlines and knowing one's family registry is important. Given that adoption is taboo among Koreans, families that adopt may keep it a secret. One way to break the cultural taboo of adoption is for more South Korean families to adopt and for Koreans to resist providing employers with information about their family registries (Evans 2015).

At the same time, transnational adoption of children from South Korea to countries in the Global North remains a significant issue. Transracial adoption has a complex history in South Korea, directly related to the Korean War and subsequent militarized sex industry surrounding U.S. camptowns as well as social stigma associated with single motherhood. Many scholars have discussed the politics of transnational adoption from South Korea, in which approximately 200,000 South Korean children have been placed for adoption in the Global North since 1953, with the majority adopted by American families. The politics of

transnational adoption from South Korea, as many authors have shown, exacerbate power differences between countries, as children from disempowered, colonized, or occupied nations like South Korea are adopted into wealthier nations in North America and Western Europe. The result is often significant losses for the adopted children of their culture, language, and family.

Sri Lanka

Overview of Country

Sri Lanka (known as Ceylon until 1972) is a South Asian island state located south of India in the Indian Ocean. Its total area is roughly 25,332 square miles (or 65,610 sq. km), with a terrain ranging from mostly low and flat, to rolling plains, to mountains in the south-central part of the nation.

The first Indo-Aryan settlers were clans that arrived in Sri Lanka in the late sixth or early fifth century BCE. The most powerful was the Sinhalese, from northern India. Buddhism was introduced circa 250 BCE and adopted by the rulers of Anurādhapura, one of the largest cities in South Asia.

As of July 2016, the population of Sri Lanka was about 22,235,000 (CIA 2017). As of 2012, its ethnic breakdown was approximately 74.9 percent Sinhalese, 11.2 percent Sri Lankan Tamil, 9.2 percent Sri Lankan Moors, and 4.2 percent Indian Tamil, with other ethnicities accounting for 0.5 percent. In Sri Lanka, 70.2 percent of the population practice Buddhism, the nation’s official religion. About 12.6 percent of Sri Lankans are Hindu, 9.7 percent are Muslim,

6.1 percent are Roman Catholic, and 1.3 percent practice other forms of Christianity.

In 2015, the UN Development Programme (UNDP) ranked Sri Lanka 73rd out of 187 nations based on the Gender Inequality Index (GII), a composite measure reflecting achievement inequality between men and women in the dimensions of empowerment, the labor market, and reproductive health (UNDP 2015). The UNDP and other international organizations have held up Sri Lanka as a regional leader in women's education and health. Nevertheless, the UNDP has identified several areas for improvement in women's economic and political participation, including a high female unemployment rate, low political participation, and gender-based violence (UNDP 2012).

Girls and Teens

A series of interviews of adolescents conducted in the municipality of Kandy (the second-largest city in Sri Lanka at the time) indicated that both male and female Sri Lankan students felt respect for elders was an important cultural tradition. They also believed it was important to be humble, trustworthy, loyal, and disciplined (Hitchcock et al. 2006, 21). However, girls were expected to exhibit more of these behaviors than their adolescent male counterparts. They further described a girl showing suitable behavior as listening to what parents and teachers say and observing rules and regulations, such as by not creating trouble and observing the traditions and customs of the country. Talking nicely with and setting a good example for others, loving their country, and performing community service were likewise identified as suitable behaviors for women and girls in Sri Lanka (21). However, at the time of this writing, there were indications that traditional, exclusive gender roles may be changing. For example, traditions about female puberty, such as ritual bathing, lavish parties, restrictive diets, and seclusion during menstruation, have lost some meaning (Wijeratne 2015).

Recreation

In the mid-2000s, Sri Lankan adolescents were experiencing a lot of academic pressure from parents (29), feeling they did not have enough variety in their lives to balance out academics with extracurricular activities. As of 2017, among the few after-school activities that are available to girls in Sri Lanka, Girl Guides (similar to the American Girl Scouts) seems to be the most popular.

Sex Education

At the time of this writing, sex education in Sri Lanka is undergoing a major curricular overhaul. In the 2010s, from experts and lay citizens alike, pressure was mounting to revise the country's extant sex-ed programming—which had not been updated in 16 years—such that it would provide students with comprehensive, rather than abstinence-centered, sex education. In its action plan for 2013–2017, the UN Populations Fund (UNFPA) promised to provide technical assistance for the inclusion of comprehensive sexuality education in technical and vocational schools, especially by providing teachers with training skills (UNFPA 2013). Consequently, in 2015, the Sri Lankan government reported an increased national capacity to design and implement community and school-based comprehensive sex education programs that promote gender equality and human rights (UNFPA 2017).

This change signified a departure from Sri Lanka's prior sex-ed pedagogy paradigm as well, because it would no longer be based on traditional gender roles, which placed the responsibility for safe sex squarely on the shoulders of Sri Lankan females. Instead, it would underscore the importance of contraception for both girls *and* boys and remove legislation and language that implied to be female and sexually active is a more condemnable offense than that committed by sexually active males.

However, neither the long-established sex education program nor its replacement included any acknowledgment of nonheterosexual, that is, cisgender male–cisgender female, sex or any mention of lesbian, gay, bisexual, transgender, queer, or intersex sexuality in its materials and programming. It was proposed that such content would be unnecessary because LGBTQI sex is not always primarily related to reproduction. Others contended that a complete omission would be dangerous because it would not adequately inform LGBTQI youth about the dangers of sexually transmitted diseases and how to prevent them.

Regardless, there have been a few signs that Sri Lanka, at least at the policy level, is becoming more progressive about sex education. Sri Lanka has been noted for the inclusion of HIV/AIDS in its agenda-setting governance and commended for its comprehensiveness and content. In the mid-2010s, the United Nations and Sri Lanka's education system teamed up to develop and integrate 30 terms related to reproductive health in sign language to assist in the more complete sexual education of students with disabilities (Wipulasena 2016).

Education

State-subsidized primary-to-university-level education has existed in Sri Lanka since the 1940s (ADB 2016, 32). Steps taken to increase educational access since then include extending secondary opportunities to rural areas and providing incentives such as free textbooks and subsidized transport. These steps along with compulsory education for children ages 5–14 since 1998 have resulted in almost universal primary education (32). However, the United Nations has expressed concern about the quality of Sri Lankan education at all three levels: primary, secondary, and tertiary (UNESCO 2013, 9). Also, there is a disparity in education resources among districts and between the urban, estate, and rural sectors and a shortage and uneven distribution of secondary schools with an advanced science program. Science teachers as well as teachers for the other core subjects of mathematics and English are also highly sought after.

One major initiative designed to improve educational outcomes in Sri Lanka is the Transforming the School Education System as the Foundation of a Knowledge Hub Project (TSEP), which promotes “students’ access to, and quality of primary and secondary education to provide a foundation for the knowledge-based economic and social development of the country” (World Bank 2016). And TSEP supports an initiative of the Sri Lankan government called the Program for School Improvement, which aims to strengthen school performance and improve student learning. Several other reforms were being supported, including establishing a system for conducting national assessments of learning outcomes, school-based management, and school-based teacher development (World Bank 2016).

When students reach the examinations for the Sri Lankan General Certificate of Education, either at the ordinary level (at the end of the 11th grade) or at the advanced level (at the end of the 13th grade), they tend to leave the education system. Examination pass rates are low, particularly at the A level, but less so for girls—58 percent of girls versus 48 percent of boys passed in 2013 (ADB 2016, 32). Those who leave school may enter the workforce directly or enter into technical and vocational education and training (TVET), albeit the effectiveness of the TVET educational system has been called into question. Youth unemployment rates are particularly high among young women; this is also true of those with higher education (32).

As delineated by the Sri Lanka Ministry of Education, in the GCE AL course, students are expected to decide to

pursue their education in one of four “streams”—science, commerce, the arts, or technology—and select three subjects in their chosen stream for further study. Typically, girls are encouraged to pursue degrees in the arts, indigenous medicine, or paramedical studies, although enrollment for female students in vocational training education has increased (Madurawala 2014).

Special Education

Since its inception in the early 20th century, Sri Lankan special education has been constantly developing. According to a report by the UNICEF regional office for South Asia, “The provision of education for children with special educational needs through an institutional system can be traced back to 1912, when the Church of England established the first residential special school for the deaf and blind” (UNICEF 2003, ii). Thereafter, private citizens and voluntary social service agencies “took an interest in establishing special schools” (ii). The Sri Lankan government assumed full responsibility for the education of children and began to nationalize private and religious schools in 1960. The country’s first government school for children with mental and physical handicaps was built four years later. And four years after that, in 1968, Sri Lanka adopted integrated education for children with special education needs; this resulted in the integration of such children into regular schools from the 1960s to the 1990s. This, in turn, “inspired the Sri Lankan educational authorities so much that they espoused the concept of inclusive education,” as made evident by the Educational Reforms of 1997, which “supported the philosophy and practice of inclusive education” and “included assessment and recording procedures to be implemented for every child on admission to the formal education system” (ii). Additional legislative support for special education came in the form of Article 4 of the Sri Lankan Constitution, which guarantees fundamental rights for people, and under the Act for the Protection of Rights of Persons with Disabilities enacted in 1996 (Muttiah, Drager, and O’Connor 2016).

However, Sri Lanka’s special education paradigm is not perfect—at least not yet. Inclusive education across the country has not been consistently available, with gender disparities occurring “not so much between sectors but between and within districts” (Jayaweera and Gunawardena 2007, 8). Some schools that can be accessed by children with disabilities “might not provide education in minority children’s languages, be able to provide good

quality teachers who can respond to children's specific needs, or support children with disabilities." And what's more, "It is also frequently the case that schools reproduce the discriminatory attitudes and practices of the wider society" (8). The effects have proven particularly pernicious for girls with special needs; in the early 2000s, it was thought that female children who had disabilities were "not being sent to schools, even though the incidence of a number of disabilities is higher in females" (29).

Health

Health care in Sri Lanka consists of two parallel services. Community health services mainly focus on maternal and child health and communicable diseases as well as adopting prevention and health promotion strategies based on Sri Lanka's system of health units, which have areas that coincide with local government administrative units. Also known as MOH units, they are managed by a medical doctor, supported by public health field staff, and number 341 areas as of 2015. Curative services, meanwhile, consist of divisional hospitals (496 as of 2015) that provide hospitalization and ambulatory services and 474 primary medical care units that exclusively provide ambulatory care and function with nonspecialist medical doctors and others.

The key health issues in Sri Lanka identified by UNDP are (1) addressing the special health needs of the elderly, disabled persons, and people in conflict-affected areas; (2) poor nutrition; and (3) the need to improve health services in deprived locations and reorganize the health system to respond to noncommunicable and other emerging diseases. In contrast, Sri Lanka's child and maternal health care—both prenatal and postnatal—have been singled out for their relative thoroughness and moderate-to-high effectiveness.

Access to Health Care

Health care in Sri Lanka is state-supported. The nation has a countrywide, comprehensive network of health centers, hospitals, and other medical institutions, with about 57,000 hospital beds and a large workforce engaged in curative and public health activities. Since user fees were abolished in 1977, general taxation has financed Sri Lankan health care, which graduate and postgraduate health personnel—trained at government expense—deliver. Since the early 2010s, the country has used its network of clinics and hospitals to set up "healthy lifestyle centers." Seven hundred

have opened since September 2014. Primary care health workers have been retrained to give nutrition and lifestyle counseling, which according to the World Health Organization (WHO) has resulted "in a more integrated, people-centered and economical approach to health care and promotion" (WHO 2017). Additionally, government personnel are permitted to work in the private sector in their after-duty hours, compensating for low salaries and improving retention of personnel in rural areas and access to health services at all hours, even though this out-of-duty service is not provided free.

Maternal Health

Many consider Sri Lanka to be something of a gem in terms of maternal health. Statistics suggest that reputation is deserved: 88 percent of pregnant women are visited at least once at home by a Public Health midwife, 95 percent attend clinics at least once during pregnancy, and 92 percent of postpartum mothers receive at least one home visit within the first 10 postpartum days.

The strength of Sri Lanka's present-day maternal health care system is the culmination of more than a century's worth of programmatic developments. Health service for mothers in Sri Lanka began with the 1897 establishment of the first Sri Lankan maternity hospital. A Public Health Department was set up in the Colombo Municipal Council in 1902; the establishment of a formal Maternal and Child Health Department followed in 1906. Twenty years later came the first Sri Lankan Health Unit, a defined geographical area under a medical officer of health with a team of field-level health workers to carry out activities that include community-level maternal and child care. The following year, the Medical Ordinance of 1927 made provisions for and established a legal requirement for the registration of midwives. (Fernando, Jayatileka, and Karunaratna 2003).

By all accounts, these various interventions were effective: In 1931, the maternal mortality rate (MMR) was 21.4; in the decades that followed, the MMR steadily declined (save for a malaria epidemic in 1935) until 1947, when it was about half of that in 1931. And from 1948 to 1977, the decline in MMR continued, sometimes markedly; this decline persisted up to the present day. In May 2016, the Center for Global Development reported that Sri Lanka had halved maternal deaths relative to the number of live births at least every 12 years since 1935, meaning a decline in the maternal mortality ratio from 500–600 maternal

deaths per 100,000 live births in 1950 to 60 per 100,000 today (CIA 2017).

Diseases and Disorders

In 2015, Sri Lanka was reported to be polio-free, with a low prevalence of HIV cases and malaria no longer considered a problem (ADB 2016). By contrast, UNICEF noted, “For a country that suffers no significant food shortages and provides extensive, free maternal and child health services, it is rather paradoxical that malnutrition affects nearly one-third of children and one-quarter of women” (UNICEF 2013).

Mental health is also a major area of concern in Sri Lanka, especially when it comes to suicide. In 2010, Sri Lanka had the eighth-highest suicide rate in the world according to WHO (2010). In 2014, the country ranked fourth among 172 countries in suicides (*Colombo Telegraph* 2014). The data is hard to prove, though. The suicide rate among women—especially young women—may jeopardize the family’s honor and social standing within a community. Therefore, families may hide details regarding the incident or persuade doctors and coroners not to document the suicide and instead report it as an accident (Knipe et al. 2015). In the past, a common method of suicide in Sri Lanka (along with China and several other South Asian countries) was ingestion of pesticides; however, there has been a reduction in the use of this method as well as in the incidence of suicide overall (de Silva et al. 2011).

Meanwhile, there is an increasing incidence of chronic kidney disease in Sri Lanka, particularly in the North Central Province, Uva Province, and North Western Province. Water quality has been identified as a likely contributing factor (ADB 2016). Children and women, in particular, bear the brunt of reduced water quality: women “are often on the frontline of water supply problems, since they are normally tasked to fetch water, carry it home in heavy loads, and take care of children suffering from waterborne diseases” (ADB 2016).

Employment

As of 2015, the labor force participation rate for women was 35.9 percent, compared to 74.7 percent for males; similarly, the unemployment rate for females (7.6%) was more than twice that of males (3%). The annual Sri Lanka Labor Force Survey reported the “percentage of economically active female population is high in agriculture

predominant districts” (DCS 2016, 9). In fact, “in Sri Lanka, the majority of women are engaged in rural agriculture, the so-called informal sector, where women laborers, especially those engaged in paddy cultivation, are paid less than men for performing the same tasks” (Kramarae and Spender 2004, 362).

One of the major sources of work for Sri Lankan women is, by definition, not physically based in Sri Lanka at all: many Sri Lankan women are migrant workers who have moved to countries in the Middle East. According to a 2007 report by Human Rights Watch (HRW), although more and more Sri Lankan men are becoming migrant workers, Sri Lankan women continue to dominate Sri Lanka’s migrant labor force (HRW 2007).

Although more women in Sri Lanka are academically qualified for higher-paying positions, men hold more leadership positions in the nation’s labor force. This has been attributed in part to gender stereotyping of education options. Sri Lankan men tend to enroll in educational tracks in subjects where more jobs are available, including architecture, communications technologies, and engineering. Sri Lankan women are typically encouraged to pursue degrees in the arts, indigenous medicine, or paramedical studies (UNFPA 2016).

Family Life

As previously mentioned, Sri Lanka has been lauded for the great strides that have been made there with respect to the health and education of women. Nevertheless, some feel that the feminine experience in Sri Lanka has changed very little from generation to generation.

Girls in Sri Lanka tend to be raised to be high achievers in school, but they also adhere to deeply entrenched gender roles in the home, including the expectation that they will act as caretakers to their younger siblings; when mothers are away serving as migrant workers, their daughters inherit their day-to-day responsibilities back home. As a result, many girls wake up early every morning, sometimes as early as four o’clock, to do their homework while their siblings are still asleep. In addition, even more so than in most other Asian countries, the population of Sri Lanka is aging. This has strained the resources of many young families caring for older relatives (DeGraff and Sidhisena 2015, 201).

Sri Lanka has made progress, but it is still somewhat conservative when it comes to family planning. Since the 1980s, the country has experienced an uptick

in contraceptive prevalence and increased emphasis on reversible modern contraceptive methods such as condoms (200), resulting from technological advances in effective reversible methods of contraception worldwide and from greater availability and knowledge of such methods (201). Thus, in Sri Lanka, “the increase in contraceptive prevalence and method choice have facilitated couples’ achievement of their fertility goals and contributed to the health of women and their children” (201). Abortion, meanwhile, is mostly illegal in Sri Lanka, except in cases where the woman’s life is in danger. Even so, the most recent statistics available at the time of this writing show that more than 650 illegal abortions take place in the country every day.

Not all families living in Sri Lanka have the same rights. Homosexuality has been illegal in Sri Lanka since 1863; in 1995, the language of a Penal Code amendment was made gender-neutral, thus indicating that both gay *and* lesbian sexual acts were criminalized (Aldrich 2014, 202). Same-sex marriage has also been prohibited according to Sri Lankan law; this inherently bars partners in same-sex couples from the rights afforded by marriage.

Politics

In Sri Lanka, there is a central tier of government, a local tier, and a provincial tier. Sri Lanka consists of nine provinces with 336 local authorities (the *pradeshiya sabha*), including 23 municipal councils, 41 urban councils, and 272 rural councils. Twenty-five district secretaries are centrally appointed to coordinate district-central government activities, services, and staff. Each district is divided into 331 divisions, with a centrally appointed secretariat and secretary. The provinces were mandated by the Thirteenth Amendment to the Sri Lankan Constitution in 1987; this also gave constitutional recognition to local authorities, who were put in charge of preschool, public health, and waste management, among other responsibilities. Areas of shared authority include roads, sanitation services, and water. The central government plays a role in many areas that are “wholly or partly the responsibility of other tiers due to weaknesses in institutional capacity or resources in the lower tiers” (Jayaweera and Pinto-Jayawardena 2016, 17–18). Each province has a president-appointed governor; the president also appoints the chief secretary of the provincial administration. At the local authority level, there is an elected provincial council and elections.

Women’s Voices

Nimalka Fernando

Nimalka Fernando is an activist and lawyer from Sri Lanka who fights against human rights abuses and calls for accountability for war crimes. Government officials, who used radio shows to discuss ways to permanently silence her, have openly threatened Fernando. She is the president of the International Movement against All Forms of Discrimination and Racism (IMADR). IMADR seeks to not only end discrimination but also to foster a sense of solidarity among discriminated groups. Fernando also cochairs the South Asians for Human Rights group. When asked what role racism plays in today’s society, Fernando responded, “Racism is the political ideology that moves wars and the grabbing of resources from our countries that exposes our communities to experiences of racism and exclusion” (Capdevila 2006).

To a certain extent, Sri Lanka has been markedly progressive in the advancement of women’s rights, compared not only to its neighboring nations but also to countries around the world. It is the first nation in the modern world with a woman-headed government; in 1960, Sirimavo Bandaranaike (1916–2000) was elected prime minister of Ceylon, the first woman in the world to be chosen for that position—not even three decades after women were granted the right to vote in 1931. This trailed Great Britain by just three years. Chandrika Kumaratunga (1945–), Bandaranaike’s daughter, became Sri Lanka’s first woman

president in 1994 and served an 11-year term (UN Foundation 2012).

However, despite this early enfranchisement and leadership, the modern political landscape for Sri Lankan women in terms of both their political rights and representation in government still has room for improvement. Women have served in Parliament since 1947; yet, as of 2015, they made up only 5.8 percent—13 of 225—of elected members. In fact, women have never accounted for more than 6.5 percent of elected members (that percentage was achieved in the 1977 election). Locally, women account for 2 percent of members of municipal councils, 2.2 percent of urban councils, and 1.8 percent of the *pradeshiya sabha*.

This paucity of female political participation has been tied to several factors, including lack of interest and support from the male-dominated local and national political parties; the political party system; the fact that the so-called women's wing of most of these parties "exist to help mobilize the vote rather than to promote women's representation or to focus on issues of particular concern to women" (19); limited resources; time constraints due to household responsibilities; and reluctance to participate in what the Asian Development Bank (ADB) called an "acrimonious and volatile environment."

Religious and Cultural Roles

Buddhism has been the official religion of Sri Lanka since 1975. The other main religions practiced there are Hinduism, Islam, and Roman Catholicism (CIA 2017). In Sri Lanka, Hinduism and Buddhism have influenced social norms, leading to "the notion that the husband is considered the head of the family and the woman plays a secondary role all through her life" (Seneviratne and Currie 2001, 198). Thus, historically, Sri Lankan Buddhists, Christians, and Hindus alike have "followed certain religious practices which led them to see females as inferior or submissive to males" (198).

Like so, in Sri Lanka, "boys study to become monks to gain spiritual merit for their parents, while girls are culturally expected to work to provide for their family's material needs" (Nadeau and Rayamajhi 2013, 45). Women have not been wholly excluded from the Sri Lankan religious experience; nevertheless, "even though there is a long history of the initiation of nuns into the temple that stems back to the time of Buddha," in Sri Lanka, as well as fellow Theravada Buddhist countries Thailand and Burma, "their status is ambiguous" (45).

Some Buddhist nuns living in Sri Lanka have participated in the *Sarvodaya*, a kind of self-help movement that emerged in 1958. The movement "provides an indigenous alternative to the local government's top-down development program" and "has grown from a small group of pioneers working alongside the outcast poor to a self-help movement" whose program "emphasizes the full range of human well-being" and recognizes that "the needs of the whole person must be met—satisfying work, harmonious relationships, a safe and beautiful environment, a life of the mind and spirit, and food, clothing, and shelter" (46).

Issues

Women and the War

For more than a quarter-century, Sri Lanka was the site of a bitter civil war. In 1956, Sinhala was made the country's official language, inciting protests by the Tamils, some of whom were killed. In 1975, the Sinhalese changed Ceylon's name to Sri Lanka and made Buddhism the nation's primary religion, alienating some citizens of other faiths. Three years later, the rebel movement known as the Liberation Tigers of Tamil Eelam, LTTE, formed. Then, in 1983, the LTTE killed 13 soldiers in an ambush, which in turn led to anti-Tamil riots that had casualties. In 1990, Sri Lanka saw the withdrawal of Indian troops and the expulsion of Muslims from the country's northern cities by the LTTE. A suicide bomber assassinated India's prime minister, Rajiv Gandhi, the following year; after peace efforts failed, another Tiger suicide bomber killed Sri Lanka's president, Ranasinghe Premadasa, in 1993.

In 2002, Norway managed to mediate a cease-fire signed by Sri Lankan government and the Tamil Tigers after nearly a decade of conflict. One of the most significant nonpolitical events in Sri Lanka's history was a tsunami that took place in the Indian Ocean in December 2004, causing 30,000 deaths on the island. By June 2005, relations between the government and the rebels had started to deteriorate because of strife over sharing tsunami aid. In August of that year, Sri Lanka's foreign minister was killed, a likely assassination by the Tigers. In 2006, government and rebel officials met in Geneva, Switzerland, for peace talks. Negotiations failed, and peace went unrestored. In 2007, a government air raid resulted in the death of S. P. Thamilselvan, a political leader of the LTTE. In January 2008, the Sri Lankan government formally withdrew from the 2002 cease-fire, inciting the renewal of its fighting with the LTTE. At last, in 2009, the war ended. The estimated

fatalities stood somewhere between 70,000 and 80,000 people.

The war had a profound impact on Sri Lankan women, both during the conflict itself and in its aftermath. However,

For some women who joined the LTTE, especially those who joined early on, the LTTE represented a refreshing change from the strict cultural control of conservative Tamil society that valued shy submissiveness in young women. The LTTE cadres were encouraged to be direct—to look men in the eye and to speak with authority. . . . But the LTTE imposed strict codes of behavior both on its cadres and on other women in areas it controlled, who unlike the female cadres were expected to maintain traditional dress and demeanor. (Jayawardena and Pinto-Jayawardena 2016)

Furthermore, “since the armed conflict ended, former LTTE cadres, especially women, have faced difficulty gaining acceptance and reintegrating into their communities” (Jayawardena and Pinto-Jayawardena 2016). This, bear in mind, was what awaited women who for years endured a life in which “female chastity was highly valued, and the LTTE demanded celibacy of its members[,] . . . imposed a ban on sexual intimacy within its ranks and punished transgressors with death.”

However, the war did not affect only those women who engaged in direct combat. One editorial published in the Sri Lankan news outlet *Sri Lanka Brief* explained how women experienced challenges as a result of widowhood during the war as well as the destabilization of social structures caused by loss of property and livestock, which negatively affected matrilineal wealth inheritance (2015). Another opinion piece implied that domestic violence was another offshoot of the conflict.

Feminism in Sri Lanka

Sri Lanka has made great strides on the path to social justice for its citizenry. But like so many other countries, it has not yet eliminated the problem of gender disparity. Also, like many other countries, feminist activism is alive and well there.

The feminist movement in Sri Lanka may not look exactly like feminism as most have come to understand it. It has a unique trajectory and its own specific agenda. For example, in the past, Sri Lankan feminism emphasized the education of women, and the country's high female

literacy rate has been deemed a reflection of the success of that effort (Kramarae and Spender 2004, 834). Also, Sri Lankan feminism has historically been characterized by a strong elitist structure, producing the world's first woman prime minister as well as maintaining a class distinction and retaining ties to dominant religious and nationalist groups (834–835).

Sultanate of Brunei (Negara Brunei Darussalam)

Overview of Country

Brunei is a Southeast Asian country that has recently instated sharia, or Islamic law. It is on the northwest coast of Borneo, adjacent to Sarawak, one of the two eastern states of Malaysia. It is a little smaller than Delaware and has a tropical climate. Malay is the official language, although Chinese and English are widely used. Sixty-six percent of the population is Malay, and they are mostly Sunni Muslims. The Chinese, about 10 percent of the population, are Buddhists, the Europeans and Eurasians are Christians, and the indigenous peoples (Iban, Dayak, and Kelabit) comprise approximately 4 percent of the population and are animists (Brunei, 2015, 1024). The population is 429,646, with about 24 percent under the age of 15, 17

percent aged 15–24, 47 percent aged 25–54, and about 12 percent 55 years old and over (Brunei, 2015, 1025). Life expectancy is 78.4 for males and 80.3 for females (Brunei, 2015, 1025).

The government is a traditional Islamic monarchy. The same family has ruled Brunei for more than six centuries. Brunei benefits from extensive petroleum and natural gas fields, the source of one of the highest per capita gross domestic products (GDPs) in the world (CIA 2015), but recent low petroleum prices have jeopardized their economy, as petroleum accounts for more than 60 percent of GDP and more than 90 percent of exports (Maierbrugger 2015).

Historically, Brunei ceded large parts of its landmass to the United Kingdom and became a British Protectorate in 1888. After being invaded by the Japanese throughout World War II, it reverted to its previous relationship to the United Kingdom until 1959, when it became largely self-governing, with Great Britain being responsible only for defense and foreign affairs. In 1984, Brunei declared its independence. The government has a mixed legal system, inaugurated in May 2014, that is based on English common law and Islamic law. The first phase of a sharia-based penal code was instituted, applying to Muslims and non-Muslims, which exists parallel to the existing common law–based code (CIA 2015). For example, caning is mandatory for 12 criminal offenses. In one year, authorities caned 80 persons. Canings were carried out in the presence of a doctor, who had the authority to interrupt the punishment for medical reasons (U.S. Department of State 2014a).

Due to a lack of relevant data, the Gender Inequality Index (GII) has not been calculated for Brunei. However, the Gender Development Index (GDI) was assessed in 2014. It measures gender inequalities in achievement in three basic dimensions of human development: health (measured by female and male life expectancy at birth); education (measured by female and male expected years of schooling for children and mean years for adults aged 25 years and older); and command over economic resources (measured by female and male estimated gross national income (GNI) per capita). The GDI is calculated for 161 countries. The 2014 female Human Development Index (HDI) value for Brunei Darussalam is 0.840, in contrast with 0.860 for males, resulting in a GDI value of 0.977 (UNDP 2015, 5). The Committee on the Elimination of Discrimination against Women (CEDAW) concluded a recent meeting with the following concerns about women in Brunei: “Adoption of Syariah Penal Code (2013), imposing the

death penalty, stoning and corporal punishment for a significant number of offences; polygamy and FGM; absence of specific legislation on violence against women; criminalization of abortion and prostitution; divergent and very low legal minimum ages of marriage for girls; discriminatory laws on nationality, marriage, inheritance and family relations” (African Press Organization, 2014). The institution of Islamic law—and public understandings and interpretations of it—may have profound implications for women and the LGBT population living in Brunei, and that is a story that is still unfolding. Much of the extant research about Brunei was written prior to the promulgation of sharia; thus, the situation is in flux.

Girls and Teens

Many Muslim women in Brunei choose to wear the *tudong*, a traditional head covering. While they are encouraged to wear the *tudong* by religious authorities, there is no official policy that they are required to do so. However, female students in government-operated schools are required to wear the *tudong* (Bhagowati 2015, 250). While the legal age for marriage is 18, girls can be married as young as 14 with parents’ permission. (World Policy Center 2014).

Rape carries “a sanction of imprisonment of up to 30 years and caning with no fewer than 12 strokes for rape.” However, spousal rape is not against the law in Brunei, unless the wife is under the age of 14, the legal age of marriage (U.S. Department of State 2014). There is no specific domestic violence law, but arrests were made in domestic violence cases under the Women and Girls Protection Act 1972 (UN Women 2013).

A doctoral student in Australia, who researched young people’s use of mobile technology, stated, “With a population of 406,200, the Malay Islamic monarchy of Brunei has the highest numbers of Facebook users in Asia, not surprising with a current ratio of two mobiles to each citizen.” Concerns inevitably arise that the technology leads to problematic behavior among Brunei teenagers (University of Queensland, n.d.). Also, as in many parts of the world, acid attacks have been perpetrated against young women in Brunei. One attack in 2014 that was reported in the *Brunei News* was lethal (Kinabalu 2012).

Education

There is tension between the language of instruction (Malay or English) and secular and religious education.

Recent research reports that women do better in English and arithmetic and thus score better than men on college entrance exams. Young women are more likely to persevere when confronted with difficulties in their studies (Metussin 2015, 72), leading to better educational results.

Elementary and Secondary

Brunei requires children to attend school for a minimum of 12 years of education. This comprises 7 years of primary education (including 1 year in preschool) and 5 years in secondary. Bilingual teaching was instituted in 1984 to teach students both Malay and English. This is done to preserve culture and allow for globalization. In the sixth year, students take the Primary School Assessment (PSR) to determine the next steps—either vocational or secondary school (Ministry of Education). Tertiary education can be pursued at Brunei's university or Technical Institute (Institut Pendidikan Teknikal Brunei), or students may go abroad for college. Students who require individual plans are supported through adaptations of learning and teaching strategies, according to the Ministry of Education. Students study both secular and religious studies.

Tertiary

Students enjoy equal educational benefits, which include monthly allowances. The disadvantaged can apply for grants. Women make up more than 70 percent of tertiary graduates (UN ESCAP and UN Women 2015, 3). In Brunei Darussalam, 51 percent of students enrolled in science, technology, engineering, and mathematics (STEM) studies are female, and 49 percent are male. Brunei boasts one of the highest percentages of female graduates in STEM studies as well as PhD graduates compared to men, according to the World Economic Forum (WEF) (Shen 2014).

Health

The five leading causes of morbidity are heart disease (18%), stroke (11%), diabetes mellitus (11%), chronic obstructive pulmonary disease (5%), and lower respiratory infections, with road injuries coming on at 3 percent in 2012 (WHO 2015). The most common type of heart disease is ischemic heart disease (WHO Western Pacific Region 2011, 231).

Access to Health Care

All citizens and permanent residents of Brunei Darussalam have access to free health care. This includes all

aspects of prevention and first-line treatment of HIV. Seventeen adults and children with advanced HIV infection received antiretroviral therapy (ART) in 2010. Access to health care for migrants and guest workers is dependent on their work contracts and permits (UN Women 2013, 5). Brunei has four public hospitals, one private hospital, and a network of care centers, including 15 regional health centers, 15 maternal health clinics, 5 medical centers, and mobile health clinics to serve citizens in isolated areas. In 2008, Brunei had 2.71 hospital beds per 1,000 people. In 2010, it had 3.51 health posts per 100,000 people, 0.50 health centers per 100,000, 0.75 district or rural hospitals per 100,000, 0.50 provincial hospitals per 100,000, and 0.25 specialized hospitals per 100,000 (Boslaugh 2013, 68). Temporary residents were 7.9 times less likely to utilize public health care compared to citizens, and respondents who classified themselves as "other" were 5.8 times less likely to utilize public health care compared to citizens (Tant 2015 24). There were 76,157 documented foreign workers living in Brunei in 2013 (Tant 2015 2–3).

The government spends almost 9 percent of its total government expenditures and 2.6 percent of its GDP on health. There are 0.21 health facilities per 1,000 people and 2.79 hospital beds per 1,000 people. Of the 1.55 physicians per 1,000, 0.88 are male and 0.66 are female. There are 1.34 midwives per 1,000, and they are all female (WHO Western Pacific Region 2013, 2). A study done in 2015 reported that ethnicity plays a part; Chinese families were significantly less likely to take advantage of public health care services and significantly more likely to utilize private health care services. Indigenous groups also demonstrated significantly lower rates of private health care utilization compared to other ethnicities. The Temburong District had the lowest rates of all health care utilization and was associated with a 2.67 decreased likelihood of using public health care in the past six months. Those in need are more likely to use the services, with 93 percent of respondents in poor health using government hospitals 12 or more times in the past six months compared to 76 percent of respondents in excellent health using health care only once in the past six months. Income was also found to be positively associated with increased health care expenditures and private health care use (Tant 2015, 185).

Brunei has no medical schools. In 2008, Brunei had 1.42 physicians per 1,000 population, 0.11 pharmaceutical personnel per 1,000, 0.21 dentistry personnel per 1,000, and 4.88 nurses and midwives per 1,000. Many physicians and other health care personnel are foreign; in 2010, 388

foreign physicians were registered in Brunei (68.8% of the total), and 175 physicians were local. Among dentists, 42 were foreign (60% of the total) and 28 local. Among pharmacists, 7 were foreign (16.3% of the total) and 36 local (Boslaugh 2013, 67).

Maternal Health

Although the government is implementing a policy to provide health care for all through a system of maternal and child health clinics, including 26 located in rural areas, these services do not include family planning. Only information on birth spacing is provided (Women on Waves n.d.). Almost all births are attended by medical personnel (99.7%), and most women have four antenatal visits (WHO 2014, 26). The birth rate for 15- to 19-year-olds is 15 births per 1,000 women, and almost 27 percent of infants are exclusively breastfed for the first six months. (Taib 2014, 127). The infant mortality rate is 8.3 per 1,000 live births (WHO Western Pacific Region 2013, 1). Breastfeeding has increased; 4 in 10 mothers with infants (or 41%) were breastfeeding (*Brunei Times* 2015) as the result of increases in maternity leave and promotion campaigns.

Mental Health

There are 20.3 mental health workers per 100,000 population: 14.89 nurses, 3.31 psychiatrists, 0.95 psychologists, 0.71 occupational therapists, and 0.27 social workers. There are seven outpatient facilities and four mental health day treatment facilities. There are two psychiatric units in general hospitals and two residential care facilities. Treated cases of severe mental disorders prevalence is 53.4 per 100,000. There is no evidence of suicide prevention services (WHO 2014).

Disability

While the World Policy Center reports children with disabilities are able to be taught within the same classrooms as their peers (2014a), another source claims, “No governmental agencies exist to support children with disabilities, but one nongovernmental agency offers part-time day services to children with Autism Spectrum Disorder who are aged between four and twelve years of age” (Tait and Mundia 2012, 199). The schools do not provide special education services, so most children with disabilities stay at home (200). In 2014, there was a “Plan of Action” approved for people with disabilities, including advocacy, protection,

health, education, employment, accessibility, and transportation. The *Brunei Times* reported, “Children with disabilities shall have equal rights, shall not be separated from their parents against their will, except when the authorities determine that this is in the child’s best interests, and in no case shall be separated from their parents on the basis of a disability of either the child or the parents” (Thein 2011). An article studying teacher candidate perceptions of disability reported that while “as Muslims, the Malay families with a disabled child believe that the child was given to them by Allah to test the strength of their Islamic faith,” many future teachers have considerable misgivings about having students with disabilities in their classrooms (Haq and Mundia 2012, 371–372).

Female Circumcision

Female circumcision, or female genital mutilation or cutting (FGM/FGC), is most prevalent in Central Africa and is practiced to some extent in Brunei, Malaysia, and Indonesia, according to Amnesty International. The World Health Organization (WHO) and Amnesty International have condemned any form of female circumcision, claiming it has no health benefits, and have campaigned against extreme forms of circumcision in Africa. However, practices vary from country to country. In Bruneian custom, “female circumcision is performed on baby girls between 40 to 60 days, where a small amount of skin tissue is removed from the genitalia” (Kinabalu 2012).

Diseases and Disorders

Ischemic heart disease, stroke, diabetes, and chronic obstructive pulmonary diseases are the top causes of death in Brunei (WHO 2015). In 2008, WHO estimated that 13 percent of years of life lost in Brunei were due to communicable diseases, 71 percent to noncommunicable diseases, and 16 percent to injuries. In 2008, the age-standardized estimate of cancer deaths was 97 per 100,000 for men and 98 per 100,000 for women; for cardiovascular disease and diabetes, 293 per 100,000 for men and 275 per 100,000 for women; and for chronic respiratory disease, 69 per 100,000 for men and 44 per 100,000 for women. The infant mortality rate, defined as the number of deaths of infants younger than one year, was 11.15 per 1,000 live births as of 2012. In 2010, tuberculosis (TB) incidence was 68 per 100,000 population, TB prevalence 91 per 100,000, and deaths due to TB among HIV-negative people 2.7 per 100,000. As of

2009, an estimated 0.1 percent of adults aged 15–49 years were living with HIV/AIDS (Boslaugh 2013, 67).

Employment

Brunei ranks 36th of 142 for labor force equity. Fifty-six percent of women are actively involved in the workforce, compared to 76 percent of men. Only 44 percent of professional and technical workers are female, compared to 56 percent that are male. Women make up a large part of entrepreneurs. About 29 percent of women work as domestics, compared to 1.9 percent of men (UNDP 2015, 6). Of the 683 new businesses created in 2001, 52 belonged to or were run by women. Women are encouraged by the government to set up high-tech companies. They hold executive or professional positions in education, medicine, law, research, and information technology (World Trade Press 2010, 2)

Family Life

Families often choose the marriage partner. The tradition is that a newly married couple joins the bride's parents (Ember and Ember 2001, 315), and multigenerational families often live in one home. A recent article in the *Brunei Times* (Bandial May 2, 2015b) reported that imams, in their sermons marking National Family Day, stressed the importance of family: "A happy family is defined as one which is formed from a legitimate marriage, capable of meeting the spiritual and material needs of everyday living, professing total submission to Allah, and fostering balanced and compatible relationships among the family members and society." Sermons included admonitions to parents to raise their children well and warned about the dangers of the Internet, which appears to pose a threat to religious leaders: "The significance of the Internet in our lives today is inescapable. It is through the Internet that we are exposed to the world of fashion, ways of speaking, and manners of interaction, lifestyle, and many more" (Bandial May 2, 2015b).

Weddings are elaborate. A recent article described a five-day extravaganza involving "a series of elaborate ceremonies, including a dowry of 500 Brunei dollars and a cleansing ritual. For the Nikah, or solemnization ceremony, Kyle [the groom], wearing a sarong handed down from his father-in-law, recited his vows in front of both families—in one breath, in Malay, remembering all his wife's eleven names" (Holmes 2013). Divorce is rare. "Family law in

Brunei grants nearly all the power to men, and there is little a wife can do in opposition to her husband without applying for the court to intervene on her behalf, whereas the husband can largely act unilaterally" (Kte'pi 2013, 154–155).

Politics

A Special Committee on Family Institution and Women was created in 2008 to "formulate policies, legislation, and plans of actions . . . to ensure that the gender and family perspectives are considered in national policy and financed as well." The highest posts that women have gained include ambassador-at-large and the attorney general with ministerial rank, as well as positions as auditor general, solicitor-general, and others. Two of the four universities are led by women. They serve as prosecutors both in the Syariah [Sharia] courts and civil courts. Fifteen percent of permanent secretaries or CEOs of government ministries, 26 percent of deputy permanent secretaries, and 15 percent of heads of overseas missions are women (UN ESCAP and UN Women 2015, 6), but there are no women in ministerial positions (Goryunova 2017, 5).

Religious and Cultural Roles

Sharia will impact the women of Brunei significantly. Women are already expected to obey their husbands, but some believe sharia may create more constraints on the women of Brunei, especially as the royal family is often in the press for secular kinds of behaviors. One writer suggests, "This decision may have a number of unintended consequences, ranging from resistance by the country's increasingly educated and cosmopolitan youth to a decline in the attractiveness of the country as a destination for tourism and foreign investment" (Roberts 2014, 95).

Issues

Legal

The first phase of the Syariah (Sharia) Penal Code (SPC), enacted in 2014, pertains to offenses punishable by fines or imprisonment. It prohibits drinking alcohol, eating in public during the fasting hours of Ramadan, cross-dressing, and propagating religions other than Islam. Two additional phases of the SPC, which have not yet been enacted, will introduce severe punishments, such as death by stoning for persons convicted of fornication, adultery, or anal sex;

the amputation of hands for theft; and death for apostasy or contempt of the Prophet Mohammad (U.S. Department of State 2014). A recent article in *The Diplomat* reported that the “first phase of sharia law, which include fines and prison sentences for ‘crimes’ such as mandatory Friday prayers, has been rolled out. . . . [I]mplementing the second phase will introduce harsh punishments such as floggings and cutting off hands for property offenses. The third and final phase . . . will introduce executions, including stoning, for offenses like adultery, abortion, homosexuality/sodomy, and even blasphemy” (Ozanick 2015). A videotaped incident of a couple physically abusing a tied-up four-year-old resulted in imprisonment of the couple for up to 10 years with or without whipping not exceeding 10 lashes, a maximum fine not exceeding \$20,000, or both (Kamit 2016).

Some general legal issues in Brunei outlined in *Women, Business and the Law* include the following: the constitution does not contain a clause on nondiscrimination or equality, women cannot confer citizenship on a child in the same way as men, wives are required to obey their husbands, married wives do not have equal ownership rights to property, sons and daughter have unequal inheritance rights, child care is not subsidized by the state, and employers do not have to provide leave for the care of sick relatives (96). Laws have been passed to protect women from family violence, including the Unlawful Carnal Knowledge Act, Women and Girls Protection Act 1972, Islamic Family Act, Married Women Act, and the Children and Young Person Act. The Islamic Family Law has specific policies regarding family violence, including restraining orders, powers of arrest, compensation, and counseling (UN ESCAP and UN Women 2015, 8). In addition, there are hotlines, shelters, and phone counseling in Brunei. Another concern in the country is online crimes involving men and younger women, so a Child Online Protection Framework was recently approved (10).

Abortion

Some Muslims permit an abortion up to the 120th day after conception, and others prohibit it entirely. Gilla Shapiro provides an overview in her article on the subject, in which she points out that after 120 days, the fetus is considered a person. However, even after that time, abortion may be permitted to save the life of a pregnant woman. Shapiro emphasizes that doctors are now answerable to religious leaders rather than the patients themselves (Shapiro 2014,

486–487). In Brunei, if performed when the woman is “quick with child,” the person performing the abortion may be punished by up to 10 years’ imprisonment and a fine. A woman performing her own abortion is subject to these same penalties (Women on Waves n.d.).

Human Trafficking

Brunei is a destination country for men, women, and children subjected to forced labor and sex trafficking. People from Indonesia, Bangladesh, China, the Philippines, and Thailand come for domestic jobs or on visit passes or tourist visas and are sometimes subjected to conditions of involuntary servitude when they arrive. Some women and girls are used as sex workers. Some victims are subjected to debt bondage, nonpayment of wages, passport confiscation, physical abuse, and confinement. Although it is illegal for employers in Brunei to withhold wages of domestic workers for more than 10 days, some employers are known to withhold wages to recoup labor broker or recruitment fees (U.S. Department of State 2014, 211).

HIV/AIDS

Laws, regulations, and policies exist that present obstacles to effective HIV prevention, treatment, care, and support for female sex workers, female drug users, and female migrant workers. There are no protective laws or regulations that protect people living with HIV. No HIV test is required for short-term visits, but people wishing to work or study in Brunei Darussalam must undergo a health examination, including a mandatory HIV test in their country of origin and again within two weeks of entering the country. In addition to cancellation of their work permits, the government also aims to provide appropriate counseling to workers who test positive for HIV. Workers who do not speak English or Malay are provided with a translator from their embassy. Under the Infectious Disease Order 2003, physicians must report positive HIV tests to the Department of Health Services. The Infectious Disease Order criminalizes HIV transmission and exposure.

Domestic Workers

More than 22,000 domestic workers come to Brunei to work 12–17 hour days for a monthly salary of USD\$200–USD\$300 per month, much less than they were contracted. Contract substitution is common, as are unpaid wages or delayed payment. More serious, if more rare, are physical

assaults and rapes (Bandial 2014). In 2015, the Labour Ministry of the Philippines instituted new policies about verifiable minimum wages, causing an almost 25 percent reduction of the Brunei demand for Filipino domestic servants (Bandial 2015a).

T

Taiwan

Overview of Country

Taiwan is an island located in East Asia that is officially part of the Republic of China. It is bordered by the Taiwan Strait, Philippine Sea, East China Sea, and South China Sea. It lies to the north of the Philippines and off the southeastern coast of China. Taiwan is roughly 13,892 square miles (35,980 sq. km) with 973.3 miles of coastline, which is slightly smaller than the states of Maryland and Delaware combined. Most of population resides in the western third of the country, which is flat or gently rolling plains; the eastern two-thirds are mostly rugged mountains.

Taiwan was first inhabited by Austronesian people before Han immigrants dominated the island in the 17th century (Ming Dynasty). Taiwan became home to Han immigrants beginning in the late Ming Dynasty (17th century). In 1895, Taiwan was ceded to Japan by China's Qing Dynasty because of military defeat. In 1922, the Republic of China (ROC) was established on the mainland of China. After World War II, the ROC took governance of Taiwan. In 1949, the ROC government lost control of the mainland and fled to Taiwan. In the 1980s and early 1990s, Taiwan had a peaceful transfer of power from one party system to a multiparty system. In the 21st century, Taiwan has had rapid economic growth, and its culture is influenced by

traditional Chinese culture, Confucianism, Japanese culture, and Western values.

According to the *CIA World Factbook* (CIA 2016) and the *Republic of China Yearbook 2015* (Executive Yuan 2015), Taiwan has a high rank in the education, health care, human development, and economic freedom in Asia. By July 2015 (CIA 2016), the population of Taiwan was 23,415,126 and included three major ethnic groups: Taiwanese, including Hakka (84%); mainland Chinese (14%); and indigenous (2%). The largest age group is 25–54 years old (47.06%), and both male and female groups are close to 50 percent for the total population. The constitution of religions in Taiwan includes a mixture of Buddhist and Taoist (93%), Christian (14%), and other (2.5%). In 2015, the infant mortality rate was 4.84 deaths per 1,000 live births for males and 4.01 deaths per 1,000 live births for females. In addition, the life expectancy at birth was 76.85 years for males and 83.33 years for females. Women's fertility rate was 1.12 children born per person.

In 2014, the Gender Inequality Index (GII) of the Republic of China (Taiwan) was 0.052 (Executive Yuan 2016a). Traditionally, Taiwan's society was influenced by Confucian philosophies, and women were considered inferior to and directly controlled by men, such as their husbands, fathers, brothers, and even their sons (Farris, Lee, and Rubinstein 2004). Also, women were deprived of the rights of education and working, as they were expected to obey their husbands and stay within the private realm of the home.

Table 1 Age and Sex Structure of Total Population

Age Group	Number (Percentage)	Gender	
		Male (Percentage)	Female (Percentage)
0–14 years	3,164,658 (13.52%)	1,632,763 (6.97%)	1,531,895 (6.54%)
15–24 years	3,128,557 (13.36%)	1,606,940 (6.86%)	1,521,617 (6.50%)
25–54 years	11,018,458 (47.06%)	5,505,063 (23.51%)	5,513,395 (23.55%)
55–64 years	3,181,641 (13.59%)	1,556,205 (6.65%)	1,625,436 (6.94%)
65 years and over	2,921,812 (12.48%)	1,348,686 (5.76%)	1,573,126 (6.72%)
Total	23,415,126	11,649,657 (49.75%)	11,765,469 (50.25%)

Table 2 Literacy of Age 15 Population by Gender

	Total	University and College	Junior College	Secondary and Technical/Vocational	Primary School	Self-Study	Illiterate
Total	1,499,835	355,595	95,975	1,025,036	22,559	20	650
Male	780,104	178,104	28,210	562,783	11,670	11	326
Female	718,731	177,491	67,765	462,253	10,889	9	324

Source: Ministry of Education Republic of China (Taiwan), *Gender Statistics*.2015. <http://english.moe.gov.tw/ct.asp?xItem=14508&CtNode=11431&mp=1>

Over the past century, gender equality has become a mainstream social value. In Taiwan, women's rights have been protected and promoted in education, in work-places, and in the political systems (Clark, Lu, and Clark 2014). However, as Taiwan's society becomes more diverse, women still face multiple barriers when they claim equal rights and opportunities, as it is difficult to change traditional mind-sets and beliefs overnight (Liao, Bluck, and Cheng 2015). Gender discrimination and inequality remain significant challenges for women in Taiwan.

Girls and Teens

Literacy

Literacy in Taiwan is defined as being able to read and write by the age of 15. According to a report by the Ministry of Education, illiteracy for the total population over age 15 has decreased from 6.78 percent in 1990 to 1.39 percent in 2015. However, 90 percent of illiteracy in 2015 was among women. The National Education Act requires that all children ages 6–15 must attend elementary or junior high schools. In 2014, more than 99 percent of students continued to study after graduating from junior high (Executive Yuan 2015). Girls and boys had similar enrollment numbers at the levels of university and college, primary school, and self-study. Girls ranked higher in literacy than boys at

the junior college level, while boys were higher than girls at secondary and technical and vocational school levels.

Sex Education

In modern-day Taiwan, it is common for teenagers to have open attitudes about sex. According to the 2013 study conducted by Health Promotion Administration (HPA) among 15- to 17-year-old students, 11.15 percent of female participants engaged in sexual activity, and 86.6 percent of these participants used birth control during their last sexual encounter. By comparison, in 2011, 8.8 percent of female participants engaged in sexual activity, and 77.5 percent of these participants used birth control during their last sexual encounter. The fertility rate of 15- to 19-year-old adolescents has decreased from 12.61 out of 1,000 in 2002 to 3.92 out of 1,000 in 2013. The percentage of sexually active teenage girls is increasing, while the fertility rates of teenaged girls is decreasing.

In Taiwan, sex education focuses on the physiological knowledge of the sexes and emphasizes control and prevention of pregnancy and sexually transmitted diseases (Wang et al. 2014). However, there is a gap between the real-life experiences of teenage girls, who have diverse needs or sex education, and the courses provided by schools. Some courses include health and physical education in junior high schools and health and nursing in

Table 3 Proportion of Female Students at All Levels of Education

	1950–1951	1961–1962	1980–1981	2000–2001	2015–2016
Total	N/A	44.60	48.05	49.02	48.43
Preschools	43.52	45.07	46.85	47.68	47.61
Primary schools	38.99	47.07	48.59	47.81	47.69
Junior high schools	28.66	36.53	47.43	48.25	47.78
Senior high schools	27.09	32.08	43.87	49.54	46.21
Vocational schools	15.51	31.80	50.27	49.52	
Junior colleges	10.89	23.39	41.82	53.42	73.33
Colleges and universities			39.42	47.17	48.60
Religious colleges	N/A	N/A	N/A	N/A	9.38
Supplementary schools, continuing education, and special schools	N/A	25.80	57.24	55.76	61.51

Note: Since the “Early Childhood Education and Care Act” was fulfilled in 2012, the kindergartens and the child-care centers were reformed to the “Pre-schools” from the SY 2012–2013.

Source: Ministry of Education Republic of China (Taiwan), *Gender Statistics*. 2015. <http://english.moe.gov.tw/ct.asp?xItem=14508&CtNode=11431&mp=1>

senior high schools. In these courses, there are very few discussions about power relations of gender, sexual development, exploration of the female adolescent body and sensuality, or diverse sexual orientations. Also, the female body is implicitly considered an instrument of production of future generations in courses and textbooks, so it negatively affects the identity development of female adolescents, which does not help teenage girls to positively develop diverse values for family roles.

Education

Female Participation

Since the early 1980s, Taiwan has had a nine-year compulsory and universal education system that includes the elementary and junior high school levels. In August 2014, the national fundamental education program was extended to 12 years. In recent years, the number of universities has also dramatically increased, which encourages people to attend higher education. Women’s education rights and opportunities have improved in recent years. The proportion of female students participating in education increased from 44.60 percent in 1961 to 48.43 in 2015. Particularly, the proportion of female students in junior high schools increased from 28.66 percent in 1950 to 47.78 percent in 2015. During past decades, the proportion of female students dramatically increased in higher education. In the school year 2015–2016, the proportion of female students was 73.33 percent in junior college and 48.60 percent in

colleges and universities. However, the investments of education for women are not just considered for their future careers but also their marriage prospects (Liao, Bluck, and Cheng 2015). Parents influenced by traditional values believe that a good education background could be an advantage for a woman who is eligible for marriage.

According to the *Gender Statistics of Teachers in Education* (Executive Yuan 2015), there is a high percentage of female teachers in early education, but a lower percentage in higher levels of education. For example, in the school year 2015–2016, 98.69 percent of preschool teachers were female, 70.75 percent of primary school teachers were female, and only 32 percent of university educators were female (Ministry of Education Republic of China 2016a). In the Ministry of Education, female employees make up a higher proportion in staff positions, but not in first executive positions (Ministry of Education Republic of China 2016b).

Education Policies and Laws

In the past decade, gender equity education policies have been established and developed rapidly in Taiwan. The topic of gender in education first appeared in volume 17/18 of the Council on Educational Reform’s (CER) *Education Reform Bulletin* in 1995. The CER was established by Executive Yuan in September 1994. At the end of 1996, the Concluding Report of the Executive Yuan’s CER included gender equity education and suggested establishing a “Gender Equity Education Committee to handle

Table 4 Staffs in Ministry of Education and Affiliated Agencies by Gender

	Grand Total	The First Executives	The Second Executives	Staffs			
		Male	Female	Male	Female	Male	Female
Ministry of Education	468	7	5	16	37	127	276
Administrations Affiliated	306	14	13	14	33	64	168
Agencies affiliated	848	43	53	8	5	308	431

Source: Ministry of Education Republic of China (Taiwan), *Gender Statistics*, 2015. <http://english.moe.gov.tw/ct.asp?xItem=14508&CtNode=11431&mp=1>

and supervise matters associated with gender equity and institutionalize the promotion of gender equity in education” (Hsieh and Lee 2014, 6). In January 1997, the Sexual Assault Crime Prevention Act was passed by Legislative Yuan. In March 1997, the Gender Equity Education Committee was established by the Ministry of Education.

In 1998, the course outline for a Nine-Year Integrated Curriculum in elementary and junior high schools was published by the Ministry of Education, and gender was identified as one of six major topics related to human social development. In 2001, the Nine-Year Integrated Curriculum was gradually implemented in Taiwan’s elementary and junior high schools. On June 4, 2004, the Gender Equity Education Act was passed by the Legislative Yuan and announced by the president to be implemented in June 23. The purpose of this act is “to promote substantive gender equality, eliminate gender discrimination, uphold human dignity, and improve and establish education resources and environment of gender equality” (Legislative Yuan 2004, Article 1). In 2005, the Enforcement Rules for the Gender Equity Education Act were enacted pursuant to Article 37 of the Gender Equity Education Act.

Health

Access to Health Care

According to the *Republic of China Yearbook* (Executive Yuan 2015), there are about 281,000 medical professionals, 498 hospitals, and 21,601 clinics operating in Taiwan. There are 21.13 physicians, 5.68 dentists, and 70 beds per 10,000 people. The National Health Insurance (NHI) was implemented in March 1995. It is the most important public health program and has the goal of providing equal access for everyone to quality health care. Women with weak economic status are still covered by NHI, so they are more likely to access the medical system because it is more

affordable. In January 2011, the National Health Insurance Act was amended to expand the premium base to reduce the financial burden on people. In January 2013, the second-generation NHI was implemented, which features a supplementary premium charge on people’s incomes of 2 percent.

Maternal Health

Since the mid-1980s, abortion was legalized for certain situations by the Genetic Health Law. However, the initial purpose of this law was to support the national population policy of reducing population rather than to improve women’s bodily autonomy. Married women can receive support and subsidies from the Health Care System for abortions with their husband’s consent if they have financial problems or psychological stress. However, the Genetic Health Law does not help women in situations of rape or allow abortions for unmarried women or due to contraception failure.

It is common to delay marriage and childbirth among Taiwan’s young people. According to the Health Promotion Administration Annual Report (Ministry of Health and Welfare 2014), the average age of women having a first child has increased from 25.2 years old in 1989 to 30.4 years old in 2013. In 2013, 94.3 percent of pregnant women used the 10 prenatal examinations by live births in Taiwan. Generally, medical studies suggest greater risk among women of advanced maternal age.

Diseases and Disorders

According to the *CIA World Factbook* (CIA 2016), in 2015, the life expectancy of women was 83.33 years, which is longer than men’s by 6 years, but that does not mean that women are healthier than men. In fact, in Taiwan, older women are more likely to experience physical and mental

diseases or disorders (Tsai, Chou, and Wang 2015). Breast cancer is the most common type of cancer and cause of death for Taiwanese women (Taiwan Cancer Registry 2011). Breast cancer rates increased nearly 50 percent, from 0.49 percent in 2005 to 0.71 percent in 2008, among Taiwanese women. In 2011, the rate of deaths caused by breast cancer increased by 1.853 percent among Taiwanese women.

Use of tobacco is a major cause of chronic diseases among Taiwanese women. In 2008, the new Tobacco Hazards Prevention Act was implemented to control tobacco hazards and promote prevention. According to a report by the Ministry of Health and Welfare, the smoking rate of female adults was 4.2 percent in 2015, a decrease of 0.6 percentage points from 2008. Also, 26- to 30-year-old females had the highest smoking rate among the total female population. Taiwan's HIV/AIDS epidemic began in December 1984. By 2016, there have been 1,905 cases of HIV-positive women.

Employment

Typical Jobs and Careers

Women in Taiwan are still underrepresented in the fields of science, technology, engineering, and math (STEM) and face barriers in the academic environment and workplace (Tam and Hung 2014). The structure of gender in the workforce is influenced by the gender differences in fields of tertiary education. According to a report from Taiwan's Ministry of Education, in the 2015–2016 school year, the female-dominated fields in universities included education (66.46%), humanities and arts (66.92%), and health and welfare (74.30%), while female students were not as well represented in the fields of science (33.27%) or engineering, manufacturing, and construction (15.15%).

Gender Discrimination in the Workplace

Gender discrimination is the most serious form of employment discrimination in Taiwan's workplaces (Chiao 2008). Women are discriminated against based on their gender, age, physical appearance, and marital status during employment. According to the Manpower Survey (Executive Yuan 2016b), in 2015, the gender gap of employment was lowest in the under-30 age group. However, in the age groups associated with marriage, giving birth, and caring for children, the female labor force dropped in the

workplace, and the gender gaps increased. For example, the gender gaps were 14.5 percentage points for the 30–34 age group and 18.9 percentage points for the 40–44 age group. In 2013, 26.8 percent of the women who left jobs did so due to marriage among the 15–64 age group who were employed before marriage. Also, 21 percent left jobs because of pregnancy. The rate of returning to the workplace for women after giving birth was only 53.3 percent in 2013. Leaving the labor market for family care was one of the reasons for the gender pay gap, because leaving a job generally results in a disadvantage in accumulating work experience. In 2014, in the nonagriculture sector, women on average earned NT\$243 (USD\$7.70) per hour, and male employees earned NT\$285 (USD\$9.04).

The Gender Equality in Employment Act was implemented in 2002. The purpose of this act is “to protect equality of right to work between the two sexes, implement thoroughly the constitutional mandate of eliminating sex discrimination, and promote the spirit of substantial equality between the two sexes” (Legislative Yuan 2002, Article 1). This law covers gender issues in the workplace and women's rights to protection from employment discrimination based on gender. To narrow the gender gap in the workplace, the act addresses issues of employment opportunities, sexual harassment, and working conditions and remuneration.

Family Life

Marriage and Fertility

In the modern society, many Taiwanese women are still influenced by traditional values (Chu, Kim, and Tsay 2014). Traditionally, a woman was expected to stay at home to take care of household chores and give birth as early as possible after her marriage, which negatively influenced her career development. However, more and more young women currently pursue successful careers, so they delay marriage and birth to achieve their career goals.

In 2014, the marriage rate for females aged 15 and over was 50.3 percent, and for males, it was 52 percent, decreases of 4 percent and 3.2 percent, respectively, from 2004. The unmarried rates for females increased from 30.9 percent in 2004 to 31.4 in 2014, and for males from 37.3 percent to 38 percent. Furthermore, the divorce rate increased 2.4 percent for both genders, and the widow rate was 10.2 percent. The average age of women having a first child has increased from 25.2 years old in 1989 to 30.4 years old in 2013. According to the 2013 Women's

Women's Voices

Yun-Fong Huang

I am deaf. That is what I am. My parents are both deaf. They had hearing parents and both hearing and deaf siblings. I was the firstborn in my family. My maternal hearing aunt believed my deaf parents were incapable of teaching a deaf child to succeed in a hearing world. She convinced my parents to let me live with her when I was three years old. Her home was two hours away. She forced me to speak words every day and punished me if I did not do so correctly. I hated trying to please her for approval. I started to resist doing what my aunt wanted.

My deaf paternal aunt came to visit and noticed I was unsmiling. She asked me if I could practice speaking on my own. My answer was yes! Thus, I came back home. I practiced speaking, writing, and reading with teachers and with my younger hearing sister. In addition, I practiced how to read hearing people's mouths because I never had a Taiwanese sign language interpreter in any classes. I often did not understand what a teacher was saying, and I had to figure out a solution by using library books.

Many hearing people assume I am from an educated hearing family because I can speak and write. In fact, my deaf parents did not get a good education. Some of my hearing family members thought a woman (especially a deaf woman) should not obtain higher education. My deaf family was familiar with what I needed based on their own experiences and frustrations, and they supported my ambitions. Finally, I got a bachelor's degree. My deaf family was proud of me.

I was excited to get a job, and I was interested in improving my job skills. However, my employer did not offer me any opportunity for advancement because I am deaf. Because of that, I am studying American Sign Language (ASL) and English in the United States. In the United States, there are teachers who know sign language, and the universities provide ASL sign language interpreters.

Marriage, Fertility and Employment Survey (Executive Yuan 2013), 51.8 percent of married females aged 15–49 with children under 3 years old cared for children by themselves or with their spouse. The percentage decreased 16 points from 2000. Of those females, 38.1 percent received help from their relatives to take care their children, which increased 14.2 percent from 2000. In addition, 9.1 percent hired babysitters, which increased 1.4 percent from 2000.

LGBT Rights

Although Taiwan has relatively progressive attitudes regarding the rights of lesbian, gay, bisexual, transgender (LGBT) people, LGBT communities still struggle to have their human rights acknowledged and protected (Chen and Wang 2010). In 2003, Executive Yuan proposed the legalization of same-sex marriages and adoptions for same-sex couples, but it was not voted on because of mass opposition. In 2012, a new bill for same-sex marriage was drafted, but it was not enacted. In the same year, approximately 65,000 people attended the LGBT pride parade in Taiwan.

Politics Participation

During the early years of transition to democracy in Taiwan (1980–1990), many female participants in politics were the wives or daughters of famous political prisoners or martyrs. However, by the 2000 presidential election, this situation had changed. In 2000, Lu Hsiu-lien, a prominent feminist activist, was elected as the first female vice president of Taiwan. In 2016, Tsai Ing-wen became the first female president of Taiwan. Currently, Taiwan has the

Women's Voices

'api

I am an indigenous woman from the Amis tribe in Taiwan. My native name is 'api, but people call me Ching Chih Tseng, which is my Chinese name. Taiwanese indigenous people have 14 tribes, but they represent only 2 percent of the total population of the country. The biggest traditional ceremony for my people is the Amis Harvest Festival (*Ilisin*), where we spend time worshipping and giving thanks to our ancestors and to the Amis tribal spirits for providing food and wealth throughout the year. The spiritual ritual is hosted by the tribal leader, but women and children are not allowed to join. After the holy ritual, everyone is invited to celebrate the harvest together. We wear traditional Amis costumes and bring traditional food and wine to share with the whole tribe. Everyone eats, prays, sings, and dances together around the bonfire until midnight every day for a week. *Ilisin* is similar to the Chinese New Year in Taiwan, but it holds special significance for the Amis tribe. Now, the Amis Harvest Festival (*Ilisin*) is well-known as one of the fabulous indigenous cultural events in Taiwan.

highest percentage of female representation in most of the public sectors in Asia (Huang 2015). In 2014, more than 50 percent of the members in Control Yuan were female as well as around 40 percent of Examination Yuan. The number of female political appointees doubled in 10 years. Women accounted for 30.2 percent of senior officials. Female supervisors reached 11.9 percent of all female public servants. By the end of September 2015, 43.6 percent of supervisors in the governments of municipalities, counties, and cities were women.

Feminist Movements

The initial feminist movements in Taiwan can be traced to the 1920s, the period of the Japanese occupation. The development of the contemporary feminist movement in Taiwan was influenced by feminism in the United States and elsewhere. There are four stages in the evolution of the contemporary feminist movement in Taiwan (Lee 2008).

In the first stage, in the 1970s, Lu Hsiu-Lien brought "new feminism" forward in Taiwan. Before the 1970s, feminist movements remained at the local level, and all of them were subject to state control. In the second stage, the *Awakening* magazine was established by Lee Yuan-Jhen in 1982. This magazine marked the beginning of an increasing trend toward the feminist movement. In the third stage, women's diversity was established in organizations after the implementation of martial law in 1987. This state action shaped the growth of civil society in Taiwan and helped create gender reform in the education and employment sectors in Taiwan's future.

Religious and Cultural Roles

Taiwan has a diverse structure of religions, and the majority of the population is religious (Zhai and Woodberry 2011). In Taiwan, 93 percent of religions are traditional Chinese religions, such as Buddhists and Taoists; 14 percent are Christian; and 2.5 percent are "other" (Executive Yuan 2015). Buddhism is the major religion in Taiwan. College-educated women have increased (Eichman 2011). These nuns have received more respect and contributed to various aspects of society, such as education, social welfare, the environment, and spiritual life.

Women's lifestyles are influenced by culture. Within the traditional culture, women are expected to be good wives and mothers, so they tend to sacrifice their own personal time. However, many educated women resist traditions, promoting women's rights and controlling their own lives. Mass media has helped shape women's views of themselves as well as society's views of them. The images of women in mass media have changed since the 1970s. Traditionally, images of women were stereotypical, representing them as not working except for household chores, and needing to maintain a beautiful appearance to attract men. However, new images in the mass media today represent Taiwanese women as independent and educated.

Issues

Balancing Work and Family

In recent decades, although women's status has changed in Taiwan, there are still a lot of barriers to career development, and one of the greatest barriers is family responsibilities (Liu and Wang 2011). An increasing number of educated women desire career success and

Table 6 Gender Differential Based on Workforce Survey (Persons in Thousands)

try to balance work and family responsibilities. Otherwise, they must delay marriage and birth. Normally, their parents or their parents-in-law would help them to care for their children before the children begin kindergarten, but there are still many women who do not receive help from relatives.

Beauty Standards

In contemporary Chinese society, beauty standards for women have changed from a traditional look—"a wide face, thin and long eyes, high cheekbones, and a flat nose" (Zhang 2012, 439)—to "thin, big eyes with double-eyelids, tall straight nose resembling the 'Greek nose' in Western culture, watermelon seed-shaped face, small and undefined jawline, and fair skin tone" (450). However, these attractiveness standards have harmful effects on women's economic well-being, social well-being, and self-esteem. Women feel pressure to meet white, Western beauty standards, often by wearing makeup and undergoing surgical procedures.

It is common to see attractiveness bias in Taiwan's workplace. Appearance and attractiveness standards in the workplace impose greater burdens on women than men (Steinle 2006). A woman who is considered beautiful may receive better treatment and extra attention, while a woman who does not meet the socially constructed standards of beauty may receive poorer treatment in the workplace. Many college students spend money and time on cosmetic surgery because of the fierce competition for job opportunities. They believe that cosmetic surgery can help them improve their physical appearance, thus improving their chances of getting a job.

Tajikistan

Overview of Country

The modern Republic of Tajikistan is a presidential republic of four provinces and the smallest nation in Central Asia. It is a rugged, mountainous, landlocked nation. The capital is Dushanbe, a city of 822,000 and the country's only major urban area. Tajiks are the largest ethnic group (84.3%), followed by Uzbeks (13.8%); the remaining 2 percent consists of Kyrgyz, Russian, Turkmen, Tatar, and Arab peoples. Tajik is the country's official language, although Russian is widely used in government and business. The president and parliament are elected. The People's Democratic Party of Tajikistan is the dominant political party. Emomali Rahmon (1952–present) has been president since 1994 (CIA 2016).

In the 1860s, the Tajik people came under Russian rule. Tajikistan was not designated as a separate republic until 1929, and it did not become independent until 1991 (CIA 2016). A civil war ensued (1992–1997) between the Tajik government and an Islamist opposition that resulted in 50,000 deaths. Additionally, one-tenth of the population

fled the country. The United Nations brokered a peace agreement in 1997 (BBC 2015).

Tajikistan has one of the lowest per capita gross domestic products (GDPs) of the 15 former Soviet republics. Its economy is dominated by mineral extraction, metals processing, agriculture, and the reliance on income from citizens working abroad. Economic challenges include dependence on remittances, pervasive government corruption, devastated infrastructure, and extensive narcotics trafficking (CIA 2016).

In 2014, Tajikistan ranked 69th out of 155 nations by the Gender Inequality Index (GII) (UNDP 2015). The Global Gender Gap Index for Tajikistan is 0.675, ranking it 95th out of 145 countries (WEF 2016). Tajikistan has a strong patriarchal society; however, women do participate in government and the labor market and have the right to vote. After the civil war destabilized the country and economy, Tajikistan faced high unemployment rates and many social problems. A large number of Tajiks (mainly men) work abroad, and wives and families are often economically dependent on remittances sent home.

Girls and Teens

Tajikistan has a young, rapidly growing population. About one-third of the population is under 14 years old, and the population is growing at 1.7 percent (CIA 2016). Girls are not considered women until they give birth. Mothers train children in cultural traditions; daughters are taught to cook, clean, and sew. A “good” child displays respect for elders and obedience to parents. Etiquette is considered very important, and hospitality, humility, and respect are essential. A man may never enter a home in which only women are present, and a girl must never be left alone with a boy. At large social gatherings, men and women often remain separated.

Dress and Beauty

Modern Tajik clothing is influenced by Western styles. Tajik women often wear skirts, stockings, and heels. Skirts often contain many layers that are embellished with flowers or wavy patterns; shoes are typically round-toed, heeled, and decorated with beads or buckles. Tajiks still commonly wear their traditional dress, particularly in rural areas. Traditional dress includes colorful tunic-type dresses with wide matching trousers that are often decorated with brilliant color patterns and are accompanied by embroidered

shoes. Women often wear kerchiefs or skull-caps, and most girls still braid 40 pigtails into their hair, which is a tradition in Tajikistan. Massive embossed silver jewelry pieces are worn on special occasions.

A unibrow is considered a symbol of beauty and purity. Women who do not naturally grow a unibrow may use an herb, *usma*, to give the appearance of one. Widely sold in marketplaces, *usma* is dried and ground into a paste. This paste is smeared on the eyebrows and the space in between. The result is a bluish-green coloring of the eyebrows and space in-between. Not every Tajik woman sports a unibrow; it is mainly popular outside the capital (Elder 2010).

Early and Forced Marriage

The legal age for marriage in Tajikistan is 18 years old. Although forced marriages and child marriages are prohibited by law, both types are common, and very little is done to curb these customs. Child marriage can be punished by six months in prison, and forced marriage can be punished by five years in prison. In reality, most cases go unpunished or are punished with fines. Couples cannot register a marriage when one of the spouses is under age, so many ceremonies are unregistered and performed by religious leaders, leaving the bride with few legal rights. Child marriage in Tajikistan primarily affects girls. In 2010, 13.4 percent of girls aged 15–19 were married, widowed, or divorced, compared to 2.2 percent of boys in the same age group (UNFPA 2014).

Patriarchal attitudes and deeply rooted stereotypes of gender roles are prevalent in Tajikistan. All of these factors contribute to the continuation of child marriages and other forms of gender discrimination. Child marriage rates were low under Soviet rule, but they increased during the civil war. Many girls were forced to marry during the conflict because their parents believed marriage would protect their daughters from rape, thus safeguarding the family's reputation.

Today, poverty influences parents' decisions about their daughters' marriages. Marrying off a daughter releases the family of the economic burdens of providing for her. High rates of male labor migration exacerbate this situation. It is not socially acceptable for Tajik women to remain single, and with many men working abroad, parents feel pressured to accept the first proposal received lest their daughters remain unwed. Child marriages occur across all socioeconomic levels in Tajikistan. Islamic religious influence increased after the civil war, and imams (Muslim

religious leaders) are often willing to perform marriage ceremonies regardless of whether the couple has legally registered (UNFPA 2014).

Child and forced marriages often lead to other issues for Tajik girls. Early motherhood is common, and the onset of childbearing at an early age negatively affects the health of mothers and children. Early motherhood restricts educational and economic opportunities (UNFPA 2014). The birth rate among girls aged 15–19 years is 42.8 per 1,000 births (UNDP 2015). There is often a large age difference between a child bride and her husband, and many young brides face domestic violence. Domestic violence rates in Tajikistan are very high, with roughly half of Tajik women reporting being abused regularly (BBC 2009). There is also a strong link between child marriage and divorce. Divorce can be easily obtained by husbands, who can separate from wives as easily as sending a text message (BBC 2009). As child brides have often not completed their education and have little to no employment experience, they have limited options after divorce. Additionally, divorce is not considered acceptable, so divorced women often face harsh social stigmas (UNFPA 2014).

Education

Under the Soviet system, universal access to free basic education was considered a right. At the time of independence, Tajikistan had an almost universal literacy rate. School was compulsory for children ages 7–15, and there were many preschool options as well as technical and vocational schools for postcompulsory education (Falkingham 2000). Postindependence, there have been changes in education, although women have maintained a very high literacy rate (99.7% in 2015) and a relatively high percentage (95.1% in 2014) obtain at least a secondary education (UNDP 2016). Economic troubles have left few government resources to fund public education, and high unemployment and poverty leave families little money to spend on supplies, textbooks, uniforms, and school fees. These factors have led to reduced enrollment, attendance, and quality in Tajik schools (Falkingham 2000).

Primary and Secondary Education

School participation rates have dropped since independence. During the civil war, roughly \$100 million of damage was done to schools; one in every five schools was destroyed. Many schools have never been repaired, and infrastructure

has declined, making schools hard to access. Preprimary education is not compulsory, and the net enrollment ratio (NER) is low at 10 percent, meaning many students enter primary education underprepared (UNICEF 2009). Public education remains compulsory and consists of 11 years of primary and secondary education, although the government plans to implement a 12-year system in 2016 (Foreign Credits 2012). Primary school NER is high at 97 percent; however, roughly 18,000 children remain out of school, and 86 percent of those children are girls. The secondary school NER is the second lowest in the region at 80 percent (UNICEF 2009).

About 25 percent of Tajik girls fail to complete the full compulsory education (Country Facts 2016). Parents often remove girls from school when they reach the age of puberty to reduce contact between girls and boys, protecting their daughters' marriage prospects (UNFPA 2014). Financial considerations also impact the gender gap. The cost of education has risen, and this has influenced the drop in enrollment. During 2002–2012, public spending on education fluctuated between 3.5 percent and 4.1 percent of GDP, significantly below the average of 6 percent (World Bank 2016). High inflation and reduced government expenditures on education have resulted in the establishment of self-financed schools and the institution of numerous fees. Most schools charge for textbooks and meals and require uniforms. Given a choice, many parents opt to educate sons over daughters (Falkingham 2000).

Attendance has declined since independence. Many children cannot attend school regularly because they work to help support the family. The child labor rate is 20 percent for boys and 17 percent for girls—the highest child labor rates in Central Asia (UNICEF 2009). Other common reasons for absence from school (other than poor weather) include poor health and not having appropriate clothing. This impacts poor families more than wealthy families, increasing social stratification (Falkingham 2000). Many schools are not heated, and inclement weather can make it difficult for children to get to school.

School quality has suffered since independence. Teachers are poorly trained and paid below the average income level. Many schools have instituted fees to supplement teacher wages. Many teachers complete multiple shifts per day to accommodate all of the students because there are inadequate supplies and resources, including desks and chairs. Because of the lack of resources, repetition rates are low (0.5%), and dropout rates are high (4.5%–20%). Of the

students who drop out, 74 percent are directly related to economic difficulties (UNICEF 2009).

To address educational problems, the government developed and launched a National Strategy for Education Development for the years 2006–2015. As part of this strategy, (1) educational equality for boys and girls was declared a value; (2) early childhood care and education was declared a priority; (3) new curricula were developed; (4) educational quality was made a national priority; (5) policy-based budget planning in education was initiated; and (6) a National Center for Assessment was established to monitor national learning outcomes. However, despite these positive political efforts, resources remain scarce, and educational opportunities remain poor (UNICEF 2009).

Postcompulsory Schooling and Higher Education

Tajikistan has three types of postcompulsory schools. General secondary schools offer college preparatory education. Technical schools offer programs leading to the opportunity for continued medical, technical, and arts education. Vocational schools provide training programs for specialized occupations. Participation rates in postcompulsory schools have fallen since independence, and girls have dropped out at twice the rate of boys. Girls are more likely to study health care and education. Boys are more likely to study industry, agriculture, and business. Such choices have implications on employment and earning prospects (Falkingham 2000).

There are several institutions of higher education in Tajikistan; however, the NER in higher education is 17 percent, significantly below the subregional average. Higher education is not attractive because of the low demand in the labor market for people with extensive educational training or professional skills (UNICEF 2009).

Health

Under Soviet rule, the Tajik health care system was widely utilized, accessible, and free. A 2003 constitutional amendment eliminated the right to free health care. Since independence, health care services have deteriorated due to financial constraints and infrastructural damage. Initially, health expenditures dropped from 6.4 percent of GDP in 1994 to 1.5 percent of GDP in 1999 (Falkingham 2000); however, expenditures have risen again to 6.8 percent of GDP as the Tajik government has made improving and expanding health care a recent priority (CIA 2016).

Access to Health Care

In 1991, many doctors fled, leaving Tajikistan with the lowest ratio of doctors to population in the former Soviet Union. In 2013, there were approximately 1.92 physicians and 5.5 beds per 1,000 people (CIA 2016). Decreased government expenditures provide little funding for drugs, food, supplies, and maintenance after wages are paid. Families must often pay for drugs and supplies and may need to provide transport, as ambulance services have eroded. Informal charges for consultations are often imposed because health care workers are among the lowest paid in Tajikistan. Rising out-of-pocket costs have led to growing inequities in health care. Many turn to traditional or over-the-counter medicines (Falkingham 2000). These crises are especially pronounced in rural areas.

Maternal Health

Women's reproductive health has drastically deteriorated since independence. The rates of maternal mortality and STDs have risen, and utilization of prenatal care has fallen. Infant and maternal mortality rates remain among the highest of the former Soviet republics. Maternal mortality is 32 deaths out of 100,000 live births, and infant mortality is 33.9 deaths out of 1,000 live births. Tajik mothers' mean age at first birth is 22.8. The total fertility rate is 2.7 children per woman, and contraceptive prevalence rate is about 28 percent (CIA 2016). The relatively low fertility rate is related to the migration of male workers and the high poverty level; many cannot afford the cost of a large family. Complications of pregnancy and childbirth are a persistent problem. There is a traditional preference for having a home birth; cost and transportation are barriers to many women who want to deliver their babies in a clinic. International humanitarian organizations have established some rural reproductive health centers to provide free reproductive health care, family planning services, and sex education. Such centers are seeing success; in surrounding areas, contraceptive prevalence rates have increased, home births have decreased, and patient visits have increased (Rankovic 2015).

Diseases and Disorders

Postindependence, Tajik life expectancy decreased due to poor nutrition, polluted water, and increases of infectious diseases, such as cholera, malaria, tuberculosis (TB), typhoid, bacterial diarrhea, and hepatitis A. Leading causes

of death for women are cardiovascular disease, respiratory disorders, and infectious and parasitic diseases (CIA 2016). Tajikistan is the only country where incidents of polio are rising (Country Facts 2016).

The high volume of narcotrafficking has resulted in a rapid increase of narcotics addiction. With no substantial drug treatment programs in place, addiction has become a major health issue and is correlated with increasing numbers of HIV/AIDS cases. In 2005, an estimated 5,000 Tajiks were living with HIV/AIDS. This number ballooned to 16,400 by 2014. About 60 percent of HIV cases are drug-related in Tajikistan (CIA 2016).

Employment

During the 1930s, Soviets implemented equalitarian policies that were designed to transform the societal status of Tajik women. Changes were slow, but by the early 1980s, women made up 52 percent of the agricultural workforce, 38 percent of the industrial labor force, 16 percent of transportation workers, 14 percent of communications workers, and 28 percent of civil servants. In rural parts of the country, about half of women were not employed outside of the home because of traditional attitudes about women's roles, lack of vocational training, and lack of child care facilities (Library of Congress 1996).

Independence and the civil war sparked significant economic and labor destabilization. The majority of highly qualified, well-educated individuals who were employed in health, education, and industry fled. By 2009, approximately 800,000 Tajiks were working in Russia, primarily older men from rural areas (Ganguli 2009). Relatively few (6% of migrants) Tajik women migrated. Women who have remained in Tajikistan often struggle to care for families and are frequently abandoned by husbands who never return or start new families abroad. The current economic situation still forces younger generations of Tajik men to leave the country for work. Women constituted only 19 percent of the total economically active population in 2005, meaning that household income was mostly provided by men. As a result, many women have found themselves economically dependent on absent men (ILO 2009).

During 2002–2004, 30 percent of employed women were public-sector employees, 56 percent were agricultural workers, 52 percent were educators, and 64 percent were health care workers (the latter three are the lowest paid in Tajikistan). It is difficult to estimate the participation of

women in the informal economy; however, experts believe it is substantial. This results in a lack of secure employment, poor social protection, participation in hard forms of labor, low salaries, absence of pensions, and lack of development opportunities. Many women are forced into the informal economy due to poverty, reduced educational level, and high job market competition. Women often resort to subsistence farming, self-employment in retail, domestic service, or the sale of agricultural, homemade, or sewing products (ILO 2009).

Government Protections

The Constitution and several labor laws provide protections related to gender equality, pregnant women, and mothers of young children. Article 17 of the Constitution guarantees equality regardless of nationality, race, sex, language, religion, political convictions, education, social status, or marital status. It is Tajik law for employers to retrain workers who take leave for family responsibilities. The law prohibits the refusal to employ pregnant women or women with children or decreasing women's salaries because of pregnancy or child care responsibilities.

The Tajik Labour Code sets employment standards for women with families. This code restricts engaging women in work at night, overtime, work on days off, or traveling for work. It also requires transferring pregnant women to roles that entail lighter duties and mandates maternity leave. Women must be granted 70 calendar days of leave prior to and after giving birth. This can be extended in cases of difficult deliveries or the birth of multiples. Women can use this leave at their own discretion and are entitled to a maternity benefit of 100 percent of the average worker's wage for the entire leave.

After maternity leave, women may choose to take child care leave until the child reaches 1.5 years, with payment covered by state social insurance. Alternatively, women can choose child care leave with no payment until the child turns 3. The woman's job is preserved, and leave is included in determinations of seniority. Similar leave benefits are extended to individuals who adopt a child or exercise custody of a child. Tajik law prohibits termination of pregnant women or women with children who are 3 years old or younger and single mothers with disabled children who are 16 or younger. These rights are also extended to fathers raising children in the absence of a mother (ILO 2009).

Child Care Facilities

Following independence and the civil war, the number and quality of preschool educational institutions (PSEI) decreased; however, demand for preschool education is increasing. Lack of sufficient PSEIs affects mothers' abilities to work. From 1991 to 2005, the number of PSEIs decreased from 944 to 468; yet, the number of children attending such facilities increased by approximately 10,000. Only about 4.7 percent of Tajik children receive preschool education. Attendance of preschool is largely correlated with socioeconomic status; 29 percent of children in well-to-do households attend preschool, compared to only 1 percent of poor children. Only 50 percent of PSEIs are located in buildings specifically built for preschool, and the majority of these suffer from deferred maintenance. PSEIs struggle with shortages of furniture, toys, sports facilities, proper food, and educational supplies. The quality of teaching personnel is poor; only about 25 percent of teachers possess university degrees. The system of monitoring preschool quality is underdeveloped. Only about 10 percent of preschool monitors possess a degree in preschool education, and there is a shortage of other specialists, such as speech therapists, oculists, and teachers for children with disabilities (ILO 2009).

Family Life

Historically, Tajik women have married early (14–16 years old). These marriages were arranged by family members and involved a bride-price that was paid by the bridegroom or his family. Following marriage, women became part of the husband's household, often a large extended family. The *kelin* (incomer) bride had a lowly position within the family, but her position could rise with childbearing, particularly if she bore sons. While the Soviets tried to alter these practices, advocating the nuclear family, tradition trumped these efforts. The median age at which Tajik's married rose during Soviet rule, but marriage traditions continued as they had before. Tajik customs favored young marriage and considered it shameful to not invite an entire village to a wedding, which could last for days. Following independence, marriage rates rose, brides' ages at first marriage dropped, and wedding ceremonies became more elaborate and costly. These trends were influenced by tradition as well as security concerns.

The instability during the civil war spurred parents to seek early marriages for daughters to protect their virtue

and honor. After the war, first marriage rates decreased about 60 percent over the next 10 years. The civil war and migration of laborers created a lack of marriageable men. Additionally, it was not uncommon for a family to go bankrupt due to the cost of a marriage celebration. The Tajik government imposed a law in 2007 limiting the number of guests, event length, and amount of food allowed at weddings, and government monitors attend weddings to ensure compliance (Watson 2008). It is of note that data on marriages and birth rates are considered unreliable because both events frequently go unregistered in Tajikistan (Clifford 2009).

Responding to the many marriage issues facing Tajikistan, President Rahmon suggested declaring 2015 as the Year of the Family. Rahmon expressed concern about the rising divorce rate, the reluctance of younger people to start families, and the prevalence of genetic disorders related to consanguineous marriages. In reference to the latter, Rahmon suggested that people should limit marriages between close relatives or such marriages should be legally prohibited. Rahmon also proposed to introduce family life education in high schools (Avesta 2015).

Divorce

The divorce rate is growing (up 14% in 2012), as many women are going through divorce or abandonment from husbands working abroad. Many men start new families abroad, divorce their wives, or simply never return. Tajikistan is among the few Muslim nations where men can divorce their wives by stating the word *taloq* (divorce) three times; this can be done face to face, over the phone, or via text message (Al Jazeera 2013). The government has attempted to counter the divorce crisis by mandating the teaching of homemaking skills for girls in schools, stating that families are collapsing because brides cannot sew or cook. However, many doctors and teachers believe the problem has to do with failing education and a poor economy—citing that marriages are more likely to collapse when one spouse is poorly educated and when neither can earn a living wage (BBC 2014).

With divorce rates climbing, the issue of spousal rights is becoming increasingly salient. The State Religious Affairs Committee announced in 2011 that a divorce announcement delivered by text message is invalid, even if the marriage lacks official registration. This committee is trying to raise public awareness about the need for an official registration certificate. Under Tajik law, women

are entitled to 50 percent of a couple's property upon divorce. However, about 80 percent of women are denied property rights and child support, usually because their marriages were never registered. Most marriages are conducted as Islamic religious ceremonies, called *nikaah*, and are not registered and, therefore, not legally recognized. Most couples are unaware of the need to register their marriage. Additionally, the practice of polygamy is on the rise, exacerbating the growing divorce problem. While outlawed by the government, polygamy is permitted under Islamic law, and in some areas, it is widely practiced (up to 80% of marriages). Subsequent marriages are not registered because they are technically illegal (EurasiaNet.org 2011).

Politics

Women were granted the rights to vote and stand for election in 1924; however, the first woman was not seated in parliament until 1990. Women are underrepresented in government relative to their proportion of the population. During 1997–2014, Tajikistan's parliament had an average of 14.14 percent women, starting out at 2.8 percent in 1997 and hitting a peak of 19 percent in 2010 (The Global Economy 2016). Tajikistan was ranked by the Inter-Parliamentary Union (IPU) as 62nd out of 189 countries regarding the percentage of women in parliament (Rakhmanova 2007).

LGBT Rights

Lesbian, gay, bisexual, and transgender (LGBT) individuals face many legal and cultural challenges and are one of the most secretive parts of Tajik society. Same-sex activity has been legal, with the age of consent being 16, since 1998. However, the cultural situation for LGBT people is not favorable due to religion and traditional beliefs. There are no antidiscrimination laws protecting LGBT individuals, and harassment is commonplace. Same-sex marriage and adoption is illegal, and same-sex couples cannot access in vitro fertilization (IVF) or surrogates. Gays and lesbians are not allowed to serve openly in the military. There is no right to transition gender. There is only one gay rights group in Tajikistan, Equal Opportunities, and they report that beatings, rapes, and robberies of LGBT people are common. Victims rarely report such crimes for fear of publicity, blackmail, and police brutality (Leach 2012).

Religious and Cultural Roles

Since the seventh century, Islam has been an integral part of Tajik culture, and today 98 percent of Tajiks are Muslim. The Hanafi school of Sunni Islam became the official religion in 2009, making Tajikistan the only former Soviet state with an official religion. However, the government and president continue to espouse a secular policy. Religious practice increased after independence. The majority of Tajik Muslims are Sunni (95%), but a Shia minority exists (3%). Russian Orthodox is the most widely practiced Christian faith. Tajikistan also has small pockets of other Christian denominations and a small Jewish community (CIA 2016).

Generalized Fears of Radical Islam

The Tajik Constitution provides for freedom of religion; however, respect for religious freedom has eroded recently. In response to fears of Islamic extremism, the government began actively monitoring the activities of religious institutions to prevent religious politicization. No officially registered mosques were closed; however, hundreds of unregistered mosques, prayer rooms, and *madrassas* (Islamic religious schools) were closed. In the 2015 parliamentary elections (which some international observers declared flawed), the Islamic Renaissance Party of Tajikistan (IRPT) failed to win any seats, the first time in 15 years that IRPT has had no representation.

IRPT was a large part of the opposition during the civil war, and part of the peace agreement guaranteed them legal status and 30 percent of ministerial positions. This loss was in the wake of numerous IRPT scandals that have instigated calls for party closure by imams in state-run mosques. In 2007, the government banned girls from wearing hijabs in schools, and in 2015, President Rahmon was quoted as stating that “wearing the hijab and blindly copying a culture that is foreign to us is not the sign of having high moral and ethical standards for women” (Putz 2015). Currently, Tajikistan is unique worldwide because it is illegal for people under the age of 18 to publicly practice religion. Women are not allowed to enter mosques (U.S. Department of State 2015).

Issues

High poverty rates, high rates of domestic violence, arranged marriages, and early marriages are persistent issues facing Tajik women (UNFPA 2014). The high rate

of violence against women goes unchecked. It is rare that abused women can escape violence due to economic dependence on their spouse and poor police response.

Domestic Violence

Rates of domestic violence are extremely high due to traditional family values and reluctance by authorities to intervene in private family affairs. Nearly half of women have experienced physical, psychological, or sexual violence by husbands or in-laws. This violence is justified in the opinion of many: 62 percent of Tajik women think that wife beating is acceptable if a wife goes out without permission, 68 percent think it is acceptable if she talks back, and 48 percent think it is acceptable if she refuses sex (State Committee on Statistics of the Republic of Tajikistan 2007). Many Tajiks agreed that wife beating is justifiable for arguing, disobeying, leaving without permission, not preparing meals on time, or not caring for children properly (The Advocates for Human Rights 2008). Police rarely intervene, and when they do, they promote reconciliation. Women are frequently blamed for their abuse and may experience harassment for reporting it.

In 2013, Tajikistan enacted a law against domestic violence; however, medical and legal professionals are not properly trained to handle cases of domestic violence, and abusive husbands or relatives are rarely arrested or prosecuted. The cycle of domestic violence is exacerbated by the restriction of girls' access to education, traditional societal views on gender roles, extreme poverty, practices of early and forced marriage, migration, unregistered marriage, rising divorce rate, and resurgence of polygamy.

Thailand

Overview of Country

The Kingdom of Thailand is located in Southeast Asia, bordering the Andaman Sea and the Gulf of Thailand. The country is encircled by Myanmar (formerly Burma) to the northeast, Laos to the northwest, Cambodia to the southwest, and Malaysia at the southernmost point. As of 2014, Thailand has a population of 67.22 million (Thailand Population 2014). In the mid-14th century, a unified Thai kingdom was established that was known as Siam until 1939, when the name changed to Thailand. Thailand was renamed Siam from 1945 to 1949, after which it again reverted to Thailand (Cavendish 1999). Thailand is the only Southeast Asian country never to have been taken over and colonized by a European power, but some scholars argue that Thailand has been economically and culturally colonized ("internalized colonization") by the West. After a bloodless revolution in 1932, the country changed from an absolute monarchy to a constitutional monarchy (CIA 2014).

Ethnicity

The Thai people (also referred to as *Tai*) were once believed to have migrated from southern China, originally

establishing major state-like cities in the north of Thailand, that is, Chiang Saen, Chiang Rai, and Chiang Mai (Shodhganga n.d.). The Thais progressively migrated farther south seeking agriculturally richer lands in the central plains and increasing the Thai's claims to the land over most of the Indochina Peninsula. It is important to note, however, that contradictory archeological findings in the northeast city of Ban Chiang indicates a flourishing ancient Bronze Age that existed nearly 5,000 years ago and into the Iron Age and that Thai people originated from the area and never migrated (Baker 2019).

Notable periods in Thai history include the following: The Sukhothai Period (1238–1438) was considered the first Thai kingdom. It was founded in 1238 by governors and brothers Khun Bang Klang Thao (also known as Sri Indraditya and the first king of Sukhothai) and Khun Pha Muang (the second king of Sukhothai), who rebelled against the neighboring Khmer people and brought independence to the region, expanding its boundaries of influence. This prosperous period is known as the "golden age" of Thai culture, when the adage that there is "fish in the water and rice in the fields" reflected the abundance available to all the people. The land of Sukhothai reached to Vientiane in the north (present-day Laos) down to the Malay Peninsula in the south, and it enjoyed strong friendships with neighboring countries while absorbing elements of those cultures with which it mingled, including the advanced cultures of China. Additionally, during this period, the trade of Thai artistry was established with both Cambodia and India.

With the succession of the kingdom's second King Khun Pha Muang by the third son of King Sri Indraditya, King Ram Khamhaeng became the third king of Sukhothai. King Ram Khamhaeng supported a strong friendship with China and organized the country's first writing system that became the basis for the modern Thai alphabet. The monarchy of the Kingdom of Sukhothai, which lasted more than 200 years, represented itself as the protector and the guarantor of food, with fair justice, low taxes, and freedom to trade, and additionally cataloged the varieties and grandeur of its places (Baker 2009; Mishra 2010).

The Ayutthaya period (1351–1767) represented the capital of the Thai kingdom from 1350. Founded by King U-Thong, or Somdet Phra Ramathibodi I, the Kingdom of Ayutthaya was founded on an island within the country formed by the gathering of three rivers: the Chao Phraya, the Pasak, and Loburi. It emerged as the dominant center of the region, which the Chinese called Xian, but it was

later converted to Siam by the Portuguese (Baker 2013). Surrounded by water with rice paddies and terraces, this new capital offered a variety of geographical and economic advantages, and with the introduction of firearms, it anchored a succession of advances in conquering and expanding into other eastern and northern kingdoms and city-states, including Sukhothai. The Thai kings of the Ayutthaya period became powerful in the 14th and 15th centuries, and unlike the paternal governance of the Sukhothai rulers, the Ayutthaya kings were absolute monarchs possessing semireligious status. The society during the Ayutthaya period was strictly hierarchical and patriarchal, a class system ruled top-down from the king to the lowest social scale of commoners and slaves.

In the early 16th century, diplomatic relations with the Portuguese were established via traders and missionaries, which resulted in the establishment of an embassy within Ayutthaya. Spain was the next European nation to arrive in Ayutthaya at the end of the 16th century. In the 17th century, the Dutch, British, and French established trade relations in the kingdom (Baker 2013); yet, the brilliance of the court of King Narai (1657–1688) caused the French to launch a bid for dominance in Siam that provoked an antiforeign coup (1688) during which the formerly trusted Greek adventurer Constantine Phaulkon was executed. Thailand then closed its borders to foreigners for over a century.

Throughout the Ayutthaya period, control for the dominance of the city-states of Siam by the northern Burmese caused much fear, but by the end of the 16th century, the Siamese people had regained their power. However, the Burmese invaded Ayutthaya again in 1765, causing great destruction, including that of temples, manuscripts, and religious sculptures. This led to the self-promotion of General Phaya Taksin to king and the relocation of the Siamese to the city of Thonburi on the bank of the Chao Phraya River (opposite the city Bangkok) in 1769, ending an over 400-year period of rule.

The Thonburi period (1769–1782) represented the regaining of control of the Ayutthayan Empire as well as the extension of Siamese control over areas of Cambodia, Vientiane, and the northern part of the Malay Peninsula in the south. Within a few years of taking power, however, Taksin showed signs of instability, and he was overthrown and put to death. Taksin was succeeded by Chao Phraya (“Great Lord”) Chakri, his former military commander, who founded the Chakri Dynasty that continues to the present day.

During the Rattanakosin and Bangkok period (1782 to the present), Chao Phraya Chakri, the first king of the Chakri Dynasty, reigned from 1782 to 1809 and became known as Rama I. One of his original acts as the new king was to move the capital from Thonburi across the Chao Phraya River to the small village of Rattanakosin, also known as Bangkok. Rama I set out to restore and rebuild Siam from the massive devastation caused by the Burmese and began the process of consolidating his kingdom, which included the building of the Grand Palace and preservation of the cultural history.

Rama II (1809–1824) continued the restoration, and Rama III (1824–1851) reopened trade and diplomatic relations with Western nations and China. King Mongkut, Rama IV (1851–1868), is credited with astute political intelligence and scholarship, whereby he focused on modernizing his country in the shipbuilding industry, Western medicine, and the training of military troops in European methods. Rama IV’s skillful diplomacy succeeded in keeping more powerful expansionist nations from overthrowing his kingdom and avoided the colonization that overtook neighboring countries. His son, King Chulalongkorn (1869–1910), Rama V, continued his father’s tradition of reform and independence by abolishing slavery and improving the public welfare and administration systems.

King Chulalongkorn’s son, King Vajiravudh, Rama VI (1910–1925), was the first monarch to be educated abroad and was responsible for establishing educational reforms, including compulsory education. In 1924, King Vajiravudh proclaimed his Law of Succession, which ensures that the throne will be passed to the king’s true sons and grandsons. It is the code for patriarchal succession for the Chakri Dynasty to the present.

King Prajadhipok, Rama VII (1925–1935), inherited deep economic struggles compounded by the Great Depression. As a result of the country’s unrest and need for change, a 1932 coup headed by Western-educated Pibul Songgram and Pridi Phanomyang launched the development of the first constitution-based system of government, thus ending 700 years of absolute monarchy (Royal Thai Embassy 2016). King Prajadhipok abdicated in 1933 and was succeeded by his 10-year-old nephew, Prince Ananda Mahidol, Rama VIII (1935–1946), who at the time was enrolled in school in Switzerland. It was during this time of political change in 1939 that the country’s name was changed from Siam to Thailand.

The Kingdom of Thailand was led by two princes acting as regents until after World War II. King Ananda Mahidol

finished his education and returned to Thailand to physically take the throne in December of 1945. Six months later, he was discovered dead in his bed, with a gunshot wound to the head. The death remains a mystery, and Thais are not permitted to speculate. Any literature investigating the death is also banned (Royal Thai Embassy 2016).

Thailand's most recent reigning monarch was the well-loved and revered King Bhumibol Adulyadej, Rama IX (1946–2016), and the younger brother of the late king. Credited as the longest-reigning monarch in Thai history (70 years), his recent passing on October 13, 2016, devastated the people of Thailand. There is expected to be a year of mourning followed by the likely succession of the king's son, Crown Prince Maha Vajiralongkorn. King Bhumibol Adulyadej was born in Cambridge, Massachusetts, and he studied in Switzerland, where he met his future queen consort, Sirikit Kitiyakara. The Thai people adore Queen Sirikit, and her birthday, August 12, is a national holiday and celebrated as the country's official Mother's Day. She has been the president of the Thai Red Cross, and she promotes Thai culture (Mishra 2010.)

Girls and Teens

The family is the cornerstone of Thai society, and the family structure is traditionally based on maintaining family connections (Tapanya 2011). Family is considered a close-knit unit that follows a hierarchical pattern with parents at the top. Strongly connected to the dominant religion of Buddhism's tenet of *karma*, where parents are referenced as the "house gods" (who gave life to the child), children are expected to hold their parents in high esteem and obey them to maintain spiritual merit (*bun*). In rural areas, three or more generations will often live in one household, whereas one or two live together in urban areas (Charoenthaweesub and Hale 2011). The UN Development Programme (UNDP) ranked Thailand 89th out of 149 nations in the 2013 Gender Inequality Index (0.364).

Barring any familial tragedy or situational disassociation, that is, economic hardship, children traditionally seek parental approval and guidance and often live with their parents until marriage. Gender roles influence family dynamics; the father is expected to be a strong leader who makes the major decisions for the family, and the mother should be a good follower, support her husband, attend to the needs of the family before her own, and embrace the characteristics of gentleness, kindness, and humility. Girls are expected to do housework, such as laundry, kitchen

chores, and housecleaning, as well as tend to the younger children in the household (Esara 2004). A sense of obligation to parents is strong, particularly toward the mother, and the youngest daughter is often expected to perform the role of caregiver when her parents are elderly (Choo-wattanapakorn 1999).

Sex Education

The topic of sexuality is considered taboo in Thai culture, and parents see doctors, teachers, and sex education professionals as the appropriate sex education instructors for adolescents. Sex education policy in Thailand is unclear; however, any plans for future development of sex education programs remains unclarified by politics and politicians. Nonetheless, school curriculums and counseling services provide sex and HIV/AIDS education in all secondary schools coupled with direct access to health service systems. The school's sex education instructors are likely to lack the skills and training to provide comprehensive sex education and often utilize limited curriculum that focuses solely on the biology of sex and sexuality (ARROW 2014). Additionally, teachers are apprehensive about how parents will feel about the topic due to the cultural norm that it is not acceptable to discuss sexuality in public.

Health

As of the May 2014 World Health Organization (WHO) report, Thailand has seen a steady decrease in mortality rates. It has successfully established universal health care for all its citizens since 2002. Thailand boasts dynamic primary health care and health system development as well as a progressive health promotion agenda that is funded through alcohol and tobacco taxes. With poverty four to eight times greater in various regions of the country compared to Bangkok, the Thai government has initiated a nonconditional cash transfer for all Thais over 60 years old and for newborns to 6 years old in lower income brackets. The health care system of Thailand maintains a steady focus on strengthening disease prevention and health promotion while sustaining adequate and quality primary care. However, there are also inefficiencies in health care reform and a lack of services for small towns, villages, and migrants. An insurance scheme to aid migrants that does not discriminate based on their legal status has been newly launched, but it is too early to measure its relative success (WHO).

According to Thailand's International Conference on Population and Development report (Ministry of Public Health of Thailand 2010), Thailand has improved gender equality and empowerment of women in employment and politics, specifically improvements around women's decision making on their own health, gender-based violence, and child marriage. Additionally, certain populations still "require special attention and care such as youth, people in remote areas on highlands, in the Deep South, and marginalized populations such as migrants, ethnic minorities, sex workers, transgender populations, drug addicts, and prison inmates" (Ministry of Public Health of Thailand 2010; UNFPA 2005).

Access to Health Care

Access to health care is available and unrestricted in urban areas; yet, it remains sporadically available in small towns and villages because knowledgeable health care workers and doctors are scarce. In 1997, Thailand enacted a Reproductive Health Policy declaring that "all Thai citizens, at all ages, must have [a] good reproductive life" (Ministry of Public Health 1998). However, due to major discrepancies among vulnerable populations and in rural areas, strategies are needed to improve the distribution of information, counseling, and services for adolescents and youth (UNFPA 2005). Additionally, in an effort to reduce the burden of health costs on the poorest and most vulnerable, universal health care became free for Thai citizens in 2007, making health care more accessible to everyone. As of 2016, 99.5 percent of the population had health protection coverage, including reproductive health care. This improved access to coverage led to an improvement in two-year survival rates for cancer and heart attacks (World Bank 2012).

Prior to 2005, abortion was only legal if the pregnancy posed a risk to the mother's health or if rape had occurred. In 2005, the Thai government amended the law, making abortion more easily accessible, and thus safer, for some women. The law states that abortion is legal if the mother's mental health is negatively affected during the course of the pregnancy (ARROW 2014). The punishment for a woman who has an abortion without proving any negative mental affect is steep and costly; she is subject to up to three years' imprisonment in addition to a fine of up to 6,000 THB (USD\$200). Any person who performs an unauthorized abortion is also penalized by up to five years in prison and a possible fine of up to 10,000 THB (USD\$320). These laws create difficulty for women to attain safe abortions,

and many of them are forced to seek out practitioners who are unqualified or who perform in unsanitary conditions. Alternative contraceptives, including emergency morning-after pills, can be purchased at many local drugstores throughout the country, but access to these drugs is limited in rural areas and for migrant workers, who are unaware the pills are available or are restricted from leaving their workplaces (ARROW 2014).

In terms of contraception options, half of Thai women (44%–45%) prefer using birth control pills. Female sterilization (30%–33%) and injectable birth control (15%–18%) are the second and third most popular choices. Birth control is available from public facilities, such as health centers, district hospitals, and provincial hospitals, and drugstores, village health volunteers, and other small outlets make birth control available from the private sector (Kongsri 2011). Teen usage of condoms is low (20%–30% of sexually active youth), partly due to the perception that there is a low risk of contracting sexually transmitted infections (STIs) or becoming pregnant (Ministry of Public Health of Thailand 2010, 29; UNFPA 2005). Additionally, a growing number of teen pregnancies have resulted in the rise of emergency contraception use and unsafe abortions, suggesting that further sex education outreach is necessary.

Maternal Health

Since the initiation of Thailand's universal health care program, a safe motherhood intervention component has also promoted prenatal care for pregnant women and girls. Within these programs, health-system reforms were initiated around maternal, neonatal, and child health interventions (Acuin et al. 2011). Despite the health services in reproductive care, challenges remain: maternal mortality due to AIDS, low rates of exclusive breastfeeding, and the pervasiveness of low birth weights (Kongsri 2011).

There is an overall prevalence of low birth weight in Thailand and an increase of low birth weights in impoverished communities due, in part, to poor maternal health. Distribution in the prevalence of low birth weight across urban-rural areas and geographic regions fluctuated; yet, women who lack education and reside in poorer communities were more likely to have a low birth weight baby (Kongsri 2011). Infant mortality stood at 25 per 1,000 live births in the year 2000; however, these numbers may hide disparities among people living in poverty and migrant communities.

Traditional birth attendants or midwives have been integrated into the nurse-and-midwifery curriculum for professional nurses as advancements in medicine and nursing services, replacing the stand-alone midwife. Nurse-midwives are specialists who have broad knowledge and are skilled in making clinical decisions. The role of nurse-midwives is to maintain the nursing and midwifery model of skilled primary care for women across the life span. The nurse-midwife works with women to develop a plan of care that is socially and culturally sensitive to their desires, including decision making throughout the birthing process. Nurse-midwives are individually trained to perform effectively within all regions, paying close attention to the social and cultural differences that exist where maternal death rates are highest (Kritchaoen et al. 2011).

The Thai government endorses WHO's recommendation of exclusively breastfeeding babies until the age of six months and continuing to breastfeed until children are two years old with the addition of nutritious food supplements. Even with the support of the government, Thailand has not shown positive increases; in fact, there has been a decline in the practice of breastfeeding, with only 5.5 percent of infants being exclusively breastfed for the first six months (WHO 2012). Bangkok has seen the most dramatic drop in breastfeeding, with areas of the north, south, and central regions following close behind. There is, however, a higher rate of breastfeeding in poorer areas as well as disproportionately underweight children (Kongsri 2011).

Childbirth for girls under 20 years old remains high and is an important public health problem with an increased risk of adverse perinatal outcomes. Complications in teenage pregnancies include anemia, pregnancy-induced hypertension, prolonged labor, premature deliveries, cephalopelvic disproportion, intrauterine growth restriction, sexually transmitted diseases, increased incidence of instrumental and cesarean deliveries, increased maternal and perinatal mortality, and increased incidence of congenital malformations. Teen mothers who receive poor nutrition are at serious risk for damage to the reproductive tract, maternal mortality, pregnancy complications, perinatal and neonatal mortality, low birth weight, and death (Chirayus 2012).

Diseases and Disorders

According to WHO (2014), the life expectancy at birth in 2000 was 70 years for males and 75 for females. It is expected to rise by 2020 to 72.2 and 76.5 years, respectively.

The estimated risk of adult mortality between ages 15 and 60 is 24 percent for males and 12 percent for females. Despite improvement in rates of major communicable diseases, morbidity, mortality, and disability due to noncommunicable diseases continue to rise. The leading causes of death for Thai women of all ages are stroke, ischemic heart disease, diabetes mellitus, HIV/AIDS, nephritis and nephrosis, low respiratory infection, cervical cancer, hypertensive disease, liver cancer, COPD, road traffic accidents, and cirrhosis of the liver (Porapakham et al. 2010).

While Thailand's mortality and morbidity rates rank highest due to noncommunicable diseases, injuries caused by traffic accidents and communicable diseases, such as Artemisinin-resistant malaria and tuberculosis (TB), remain high areas of concern. Additionally, the rise of drug-resistant malaria, TB, and HIV are worrying developments. Thailand is 1 of 22 countries in the world with the highest TB affliction, and malaria is reemerging due to outbreaks in cross-border populations with limited prevention and drug resistance (WHO 2014).

According to the National AIDS Committee (2012), Thailand reports roughly 9,470 new HIV cases annually, and it estimates that around 440,000 people live with HIV/AIDS countrywide. According to UNICEF (2011), 89.41 percent of AIDS patients are 15–59 years old, and Talawat and Phiromchai further report that “most cases are a result of unprotected sex (84.17 percent), followed by drug use (4.34 percent), mother-to-child transmission (3.61 percent), and blood transfusion (0.02 percent)” (2008). In 2007, the Thai Constitution offered some general protection against the discrimination of people living with HIV/AIDS, but there is no current law that clearly bans any such discrimination. In an effort to control the spread of HIV/AIDS, Thailand has seen the most significant decrease in new infections when educating the public on sexual transmission behavioral risk factors, such as promoting condom usage, minimizing services from commercial sex workers, and STI education.

Education

The 1999 Education Act guaranteed that all children, including non-Thai children, living in Thailand have the right to a quality education without discrimination, from preschool to senior high school. Primary and secondary education is free of charge, and a minimum of nine years of schooling is mandatory. Education is divided into six years of elementary school and six years of secondary

school, which are additionally divided into three years of lower and three years of upper levels (UNICEF 2011). All students can choose vocational tracks in upper secondary schools and sometimes in lower secondary schools. Primary school age is 7–12 years old with ratios at 94.2 percent for boys and 94.1 percent for girls. These numbers represent minimal gender disparity and are not perceived as a huge challenge in Thailand; however, a lack of opportunities for girls and women to hold leadership positions in education presents serious discrimination issues. Additionally, in-class textbooks have not been updated regarding gender equity since 1993 and are in need of revision.

Thailand's education data reveals gender parity at the primary level and higher enrollment at the secondary and tertiary levels, but this data does not reflect the different socialization of boys and girls, which contributes to gender inequalities. Gender differences are pronounced at the university level, with low enrollment of women in the fields of engineering, architecture, mathematics, and computer science (UNICEF 2011). Gender equality and quality achievements for girls in basic education are promoted through gender-sensitivity programs. The United Nations is preparing to launch a global Girl's Education Initiative program dedicated to the development of gender-equality activities to address gender differences. Specific barriers to girls' education stems from discrimination against the most marginalized groups, such as the poor, ethnic minorities, nonregistered children, migrants, and girls affected by HIV/AIDS, living with disabilities, or living in remote or violent areas. Girls who are thus burdened are doubly discriminated against and less likely to attend any form of schooling (UNGEI 2014).

Employment

Overall, most women do not hold high positions of power, and a large concentration of women are employed in the service sector as domestic workers. Although Thai women have access to more job opportunities than they did in the past, thousands of women find themselves involved in the sex trade or are trafficked for sex. In 2008, women constituted 45.9 percent of the labor force, and their participation in economic development continues to rise. Additionally, there has been a decrease in the male-to-female wage gap in the formal economy, while women's roles in small to medium enterprises have increased since the economic crisis of 1997. In 2005, 64.7 percent of women were working as unpaid family helpers, and a large number of women

maintained employment in the informal economy, such as domestic, subcontracted, or home-based workers, and as such have no claims to social security or welfare benefits (UNICEF 2011).

Historically, women were expected to take care of the children and household and were not allowed to hold the same jobs as men. Thai women have only been accepted into the formal workplace within the last 30 years. Today, many Thai women are migrating to urban areas to seek jobs in Thailand's growing educated workforce to take advantage of increasing employment opportunities since the 1990s. Even with the narrowing gender gap, women are not being treated as equal to men and maintain employment in the lowest-level service positions as domestic and household workers and restaurant and snack bar "entertainers," also known as prostitutes (Romanow 2012). According to the World Bank (2012), 45.4 percent of women were employed in the nonagricultural sector in 2008.

Female professionals also play an increasing role in the workforce as Thai women seek more meaningful careers in the rapidly growing private sector, where, in 2007, 35.8 percent of workers were women. Without holding positions of power, women are credited for Thailand's growing economic success (Romanow 2012). Thailand's labor statistics classify employment status into five categories: private-sector employee, government employee, unpaid family worker, self-employed worker, and employer. Women are employed at a higher rate than men in the field of unpaid family workers, making their contribution to the farming, fishing, trading, and handicraft economies unclear. Overall, the majority of women have lower-paying jobs and less education than men (Mekrungruengkul 2011).

Family Life

In Thailand, an "ideal" marriage involves a man and woman who are mutually respectful and contribute equally according to their gendered work expectations. Thai men are expected to provide for the couple financially, whereas women manage the domestic chores. A traditional Thai expression equates a married couple to an elephant, the male representing the two front legs and women as the two back legs. This metaphor symbolizes Thai men in the front, responsible for the decision making, and women in back, representing a subordinate and cooperative role in the family.

According to the UN Statistics Division (2012), the legal minimum age for marriage without parental consent is 17

for both men and women, and the average age of marriage is 24 for women and 27 for men. The legal age of consent for sexual activity fluctuates between 15 and 18 years old, depending on interpretation of the Penal Code Amendment Act of 1997. The National Statistical Office of Thailand (2011) reports that the average household in Thailand had 4.1 people in 2000. As Thai women become more independent and advance in economic power, divorce rates also increase. During 1994, the divorce rate in Thailand was 0.97 per 1,000 couples; in 2003, it increased to 1.28 per 1,000 people.

In Thai society, women adhere to more stringent societal guidelines compared to Thai men, such as the expectation to remain a virgin until marriage. Thai men, however, receive no social criticism for openly engaging in sexual promiscuity. Another double standard exists regarding premarital sexual expression. It is considered taboo for Thai females to engage in public sexual expression until marriage. Thai couples living in urban areas can meet in a variety of places, such as schools, malls, markets, and coffee shops, while rural couples typically meet in Buddhist temples. Thai women often seek the attention of young monks who will become available bachelors after their service to the Buddhist monastery (Taywaditep et al. 2007).

In Thailand, it can be acceptable for a married male to frequent the sex market. A wife might even support her husband's choice to visit commercial sex workers to relieve her of her husband's sexual demands and to prevent her husband from pursuing an emotionally involved extramarital affair with a minor wife. This example demonstrates the helplessness many Thai wives experience as they seek to protect themselves financially and emotionally by preserving their marriage (Taywaditep et al. 2007).

Politics

Women's suffrage in Thailand has been traced back to the Ministry of Interior's Local Administrative Act of May 1897, which defined the villagers who were eligible to vote as residents "whose house or houseboat was located in that village" and specified that residents included both males and females. Thailand was the second country in the world to enact female suffrage and the first to simultaneously gain an unopposed gender-equal right to vote (Bowie 2010).

Despite Thailand's early integration of women's right to vote, only incremental gains have been made for women since the 19th century, and the political landscape remains

dominated by men. Historically, both nationally and locally, women have been absent from political roles and overlooked as participatory members in politics. It is evident, however, that Thai women's political exchange and power play as well as their unofficial planning and alliance building are undeniable contributions to leadership positions. Within early kingdoms, royal women were offered as sexual trophies to kings and neighboring nobles to form alliances and strengthen political connections (Romanow 2012).

In the 1997 constitution, women were granted equal status to men, and the 2007 constitution upheld equal rights and protection between men and women, opening doors for women to step into politics. Not until the constitution of 1997 were Thai women able to hold parliamentary seats, and at that time, women held only 6 percent of the seats. These numbers have slowly increased, and in 2010, women were voted into 13.3 percent of the Parliament seats, showing at least some progress. Additionally, the Thai government actively promotes women's political and public office advancement constitutionally and within the Women's Development Plan (2007–2011). Advancement for female political candidates in the 2007 general election increased to 14.7 percent from 10.8 percent in 2005, however, the overall number of female elected officials remained low at 11.7 percent. Additionally, female candidates increased from 10.5 percent in the 2000–2006 term to 16 percent in 2006 for the 2007–2013 term. At the local level, women have greater access to political positions due to the lack of restrictive requirements to run for office, and their active involvement in community affairs provides valuable support toward political causes (UNICEF 2011).

The Women's Development Plan (2007–2011) identifies societal attitudes toward gender as the underlying obstacle to Thai women's development. They have outlined the following strategies for advancement: promote attitude change toward gender equality, increase women's participation in political decision making, improve access to health care services, strengthen women's rights to human security, and foster women's economic participation. Still, in current Thai society, there are many important differences that exist between the two sexes, and the gender divide has not been amended (ARROW 2014).

LGBTQ+

In March of 2011, Thailand signed a Joint Statement at the UN Human Rights Council calling on states to end

violence, criminal sanctions, and related human rights violations based on sexual orientation and gender identity. The Human Rights Council stated, “We are not trying to create new or special rights. We are simply trying to address the challenges that prevent millions of people from enjoying the same human rights as their fellow human beings just because they happen to be lesbian, gay, bisexual or transgender.”

Thailand’s philosophy of tolerance extends into LGBTQ+ lifestyles; both male and female same-sex sexual activity is officially legal. However, same-sex couples and households headed by same-sex couples are not afforded the same legal protections as heterosexual couples. Same-sex marriages, civil unions, and domestic partnerships are currently not recognized under Thai law, and it is unclear whether same-sex couples or LGBTQ+ individuals would be permitted to adopt or have custody of children. Despite the lack of formal legal recognition, Thai same-sex couples are publicly tolerated, especially in urban areas such as Bangkok, Phuket, or Pattaya.

According to the International Gay and Lesbian Human Rights Commission, a same-sex-marriage bill titled the Civil Partnership Act was submitted to Thai Parliament in 2014, but no decision has yet been published. The act seeks to give couples some of the rights of heterosexual marriages, but it has been criticized due to the increased minimum marriage age from 17 to 20 and the fact that it lacks adoption rights. Basic human rights, such as access to birthright, child care, insurance, and medical care benefits are still being sought for all LGBTQ+ Thai people (IGLHRC 2011). The legal system in Thailand falls short in supporting human rights and protections for transgender people. Thai citizens cannot legally change the gender on their ID cards, creating potential barriers to employment due to fears of complications in the workplace. In an effort to protect transgender individuals, the Administrative Court of Thailand ruled in 2010 that any act of discrimination was a violation of Section 30 of the Thai Constitution (ARROW 2014).

Religious and Cultural Roles

According to documented religious chronicles, monks brought Theravada Buddhism to Thailand from Sri Lanka in the 13th century, and it is considered Thailand’s official religion today (Baker 2013). Elaborate temples stand to honor the Buddha, and they house dedicated monks (followers of Buddhism) who collect relics and images of

the Buddha as strengths and talismans of spiritual power. Thailand’s Constitution protects all religions, endeavoring to promote harmony among all religious followers and encouraging virtue and quality of life. Religious studies are required in the primary and secondary education levels. Today, 93.6 percent of the Thai population are Theravada Buddhists, 4.6 percent are Muslim, and Christianity, Hinduism, Sikhism, and Judaism each account for less than 1 percent (Winichakul 2015).

Magic, or the belief in supernatural powers via rituals, symbols, actions, gestures, and language, is highly intrinsic to daily Thai life. Also identified as animism, magic in Thai culture pays particularly close attention to all “spirits,” making sure to always please and never anger them. Spirit houses are situated in every home, business, and government establishment and include offerings of flowers, fruit, incense, and other gifts to ensure that the “ghosts” or spirits are always appeased. Numbers, especially the number 9, are highly fortuitous and are intentionally incorporated into the personal, social, and political lives of the Thai people. Throughout the country, amulets that have been blessed by monks are located in cars, trains, and buses because they are believed to provide magical protection against traffic accidents. It is important to note that religious spirituality in Thailand is not only complex but also highly important within society (Gallagher 2014).

Issues

Domestic Violence

Domestic violence and violence against women are major issues in Thailand and have typically been regarded as internal family affairs. As a result, survivors are often reluctant or unable to seek legal protection. In 2007, the Protection of Domestic Violence Victims Act was enacted, defining domestic violence as “any action intended to inflict harm on a family member’s physical, mental or health condition and any use of coercion or unethical domination to compel a family member to commit, omit or accept any unlawful act, except for that committed through negligence” (UNICEF 2011). This means that a victim, witness, or anyone with information about a domestic violence incident has the right to file a legal complaint. The police are also legally bound to investigate these cases without delay, and a public prosecutor has no more than 48 hours to file the case. The police are also authorized to file on the victim’s behalf should the victim be unable to do so (ARROW 2014).

Notable Women in Thai History

Queen Suriyothai (1548) was the queen of the Ayutthaya king Maha Chakraphat. The warring ruler of Burma, Tabinshwehti, attacked Ayutthaya, launching a battle between the kingdoms. While fighting on elephants, King Chakraphat was wounded. Queen Suriyothai rode her elephant into combat against Tabinshwehti to save the king, losing her life in the act. She is famously remembered as dying in defense of the Thai people, and her valor and bravery are celebrated and revered. In 2003, the film *The Legend of Suriyothai* was released in her memory.

Queens of the southern province of Pattani (1584–1688) were daughters of the Sultan Bahadur. Raja Hijau (green princess), Raja Biru (blue princess), and Raja Ungu (purple princess) became the successive queens of the region. During their reigns, they amassed great loyalty and respect from their kingdom, using wisdom in diplomatic relations to gain allies and keep aggressive forces from overthrowing the region for over 100 years.

Two sisters, Than Pu Ying Chan and Mook (1785), were heroines from the southern island of Phuket and organized to fight against threatening Burmese forces. Than Pu Ying Chan was the wife of the region's recently deceased governor when a Burmese invasion threatened. The sisters assembled the island's forces, and in an effort to swell the appearance of their ranks, they disguised the local women as male soldiers. After several weeks under siege, the Burmese fled, exhausted. In recognition for their ingenuity and courage, King Rama I bestowed them with the royal titles of Thao Thep Kasattri (Chan) and Thao Sri Sunthon (Mook.)

Ya Mo ("Grandmother Mo," 1826) was the wife of the deputy governor of the Nakhon Rachasima region. An invasion by Vientiane (Laos), which was pursuing independence, seized the vulnerable city while the governor was absent. In an effort to thwart plans to remove the captured citizens to Laos, Lady Mo got the invading troops drunk and smuggled cooking knives to the imprisoned men, who surprised the invading troops and caused them to flee the region. Lady Mo is highly revered for her bravery and clever strategy. King Rama III awarded her the royal title of Thao Suranari ("the brave lady") in honor of her courageousness.

Amdaen Muen (1865) was a Thai peasant feminist who fought for equal rights for women during a time when women were denied education and considered chattel to be bought and sold. Muen first fought her family for the right to literacy, and with the support of Buddhist monk Nai Rid, Muen learned to read and write. After falling in love and being rejected by Nai Rid, Muen's father arranged a marriage to a wealthy man who desired a second wife. Muen, still in love with Rid, refused to consummate the marriage, faked her drowning, and escaped back home to her village. Rid, upon discovering Muen was alive, renounced his vows, and the two sought to marry. Muen petitioned King Mongkut (Rama IV) for her freedom and ultimately won, whereby Rama IV changed the law in December 1865, allowing women the right to choose their partners in marriage. Muen's strength and resistance represents the early struggle and win for women's rights in Thailand.

Saovabha Phonsi ("Sribajarindra," 1861–1919) was the half-sister, wife, and queen of King Chulalongkorn (Rama V), and she was mother of King Vajiravudh (Rama VI) and King Prajadhipok (Rama VII). Her son, King Vajiravudh, later titled her "Queen Mother Sir Bajarindra." In 1897, Queen Saovabha became Thailand's first woman and queen to become regent of Siam when her husband went on a tour of Europe. She is considered an important woman in Thai history because she is one of only two women who were ever selected to receive the title of H.M. the Queen Regent (Somdet Phra Nang Chao Saovabha Phongsri Praborommarachiniat). She took on many issues concerning women, particularly education, and in 1904, she established one of the first schools for girls, the Rajini School (or Queen's School) in Bangkok.

Queen Rambai Barni (1904–1984) was the wife of the abdicated king Prajadhipok. She followed him to Great Britain, where she was involved in nonmilitary activism during World War II and became a leader in the Free Thai Movement, an underground resistance against Imperial Japan. She returned to Thailand after her husband's death and carried out royal duties in service to the kingdom.

Poonsuk Banomyong (1912–2007) was the widow of Thailand's Prime Minister Pridi Banomyong. Born from indigenous roots, she is honored for bringing peace and hope to the younger generation. Her work includes supporting her husband's leadership in Thailand's 1932 peaceful revolution. During World War II, she joined the Free

Thai Movement in resistance to the invasion by Japan, and she worked to bring peace. As Pridi became embroiled in political upheaval, Poonsuk was arrested and tortured from 1952 to 1953, accused of offenses against Thailand. Poonsuk did not give in, and she drew strength from the teachings of the Buddha. She served as president of the Pridi Banomyong Foundation, which sought to preserve independence, freedom, and democracy. She was honored in 2005 with the United Nations Outstanding Women in Buddhism award for her efforts to promote peace and world understanding. She was known for her humility and idealism.

Maha Chakri Sirindhorn (1955), the daughter of King Bhumibol and Queen Sirikit, graduated at the top of her class. She holds a doctoral degree, is fluent in many languages, and teaches history. She is a goodwill ambassador for UNESCO and is the recipient of many awards, including the Indira Gandhi Prize for Peace, Disarmament, and Development (2004.) The princess is highly invested in the country's development and is admired and beloved by the Thai people. She is often referred to as Phra Thep, or princess angel (Mishra 2010).

Pornpet Meunansri (1937–2004) was born into farmers' bloodline in Nakhon Sawan. She has lived and farmed on her family's land since her birth. In 1963, her father was arrested under false charges, and in 1968, government officials undertook public land mapping, which began Pornpet's 36-year resistance to the illegal expropriation of her family's land. During those years of protest, she once brought her buffalo dressed in a suit to the prime minister's office for a year, and she was arrested and placed in a mental hospital and, in a moment of desperation, attempted to burn herself alive. Pornpet had produced a wide range of "resisting pages," from petitions to posters, banners, leaflets, statements, memoirs, occasional notes, preparation notes for the court cases, and an autobiography. Ultimately, Pornpet won the right to her land but was left to deal with the damage created by years of trespassing, squatters, and vandalism. In 2004, Pornpet was on the way back home from her farm when an unknown person used a cement mile marker to hit her on the head, killing her. She believed in living a truthful life and making things right where they were corrupted. She understood the land represented a farmer's heart and soul, and she used her own life as her mission.

—Dawn Schiller

Marital rape is also considered a crime. Rape in Thai law pertains to victims of all sexes and includes all types of sexual penetration. The law provides for the victim's protection regardless of citizenship, and offers support for reconciliation between victims and offenders to maintain familial relationships. If reconciliation is unsuccessful, women can seek divorce because of abuse (UNICEF 2011). Still, law enforcement can fail to take violence against women seriously, and officials may lack sensitivity toward survivors; a victim's background, sexual history, or sexual relationship with the abuser is often used to undermine her in Thai court. A widespread culture of victim blaming causes reluctance to report abuse. Further, many women lack an understanding of their rights under Thai law (ARROW 2014).

Human Trafficking

Since the 1880s, and especially with the country's militarization during the Vietnam War, many women have worked as sex slaves (Romanow 2012). Thailand is known as a

country of origin from which women, children, and other vulnerable populations are trafficked abroad to countries such as Australia and Japan as well as being a location of transit for trafficked populations from its bordering countries. Additionally, trafficked people from Myanmar (Burma), Laos, and Cambodia are often transported to Thailand for sale into the sex or labor industries (ARROW 2014).

Due to Thailand's comparative wealth among the countries of the greater Mekong, the country is largely considered a destination for human trafficking. According to Gugić (2014), the causes of human trafficking are many and include, "statelessness, poverty, lack of education, awareness and employment, or dysfunctional families."

In 2010, continued efforts to combat trafficking by the Thai prime minister and labor and civil society organizations resulted in the second of Thailand's six-year National Policy Strategies (2011–2016), wherein the government will train thousands of police, prosecutors, immigration officials, social workers, and laborers on the identification of possible victims and available resources.

Even with increased efforts at eliminating trafficking, there continues to be a low number of identified victims among vulnerable populations and of convictions for both sex and labor trafficking. Problems that hinder antitrafficking efforts include police corruption, biases against migrant laborers, lack of stable monitoring systems, lack of understanding among officials, the court's lack of a human rights-based approach toward labor abuse, and the lack of incentives to identify victims. Victims of human trafficking experience a wide range of barriers when attempting to find protection against their trafficker, such as legal costs, language, immigration, bureaucratic complications, fear of retribution, extensive legal processes, and financial needs. The Thai government vows to continue to develop systems of protection and offers legal aid to victims of trafficking who seek financial compensation from their offenders; yet, due to a combination of barriers, very few victims take advantage of this route (Trafficking in Persons Report 2016).

Migrants

An estimated 2.4 million migrants, mainly from Myanmar (Burma), Laos, and Cambodia are living in Thailand and working in areas of agriculture, fishery, manufacturing, construction, and service sectors (Ministry of Public Health of Thailand 2010). Additionally, there are more than 1 million migrants (70%–80% from Myanmar) living and working sporadically in the country, many for more than three years. There are more female migrants from Laos (Ministry of Public Health of Thailand 2010). Migrants have a higher risk for disease and are more vulnerable to public health dangers because universal health care does not cover most of the population. Many of the migrants work with no formal contract, which leaves them vulnerable to unfair employment terms, such as unfair wages; no benefits; lack of access to social security; no organization, representation, or bargaining power; and exposure to unsafe working environments.

In both Thailand and in their home countries, migrant women are subject to a great amount of discrimination and abuse. Perpetrators of the abuse include authorities, employers, community members, and sometimes their own families. The various abuses can include labor exploitation, underpayment of wages, wage deductions, seizure of vital documents, and hazardous working conditions. Additionally, a percentage of migrant women experience more severe labor exploitation, such as no wages;

no time off; confinement; verbal, physical, and emotional abuse; and trafficking.

Migrant women fear reporting the abuse because they become even more vulnerable to multiple forms of retaliation, including further exploitation, backlash from the community, indifference from the police, job loss, and being targeted for sexual abuse (ARROW 2014). It is also known that migrant women who experience abuse by their employers can be so severely confined to their workplaces that there are no opportunities to escape and seek help. When they do find the opportunity to report the abuse, they often seek out local women's nongovernmental organizations (NGOs) for assistance (Annuska 2013).

It is extremely difficult for migrant women to access any information regarding human rights and social services, including physical, sexual, and reproductive health care. In an effort to provide assistance to workers, the Thai government continues to develop and implement legislation and programs designed to remove health and education barriers. In 2016, social security benefits for migrant workers and their families became available that are equal to benefits received by Thai nationals. Migrant workers who are registered and hired in informal employment are not eligible for social security benefits; however, they can receive universal health care for themselves individually, but not for their families. Overall, in considering the exorbitant struggle faced by migrant workers, it is important to continue to provide access to programs for fair and equitable health and education services for all workers, regardless of their immigration status (Pearson and Kusakabe 2012).

Turkmenistan

Overview of Country

Turkmenistan is a country in Central Asia that is bordered by the Caspian Sea, Afghanistan, Iran, Kazakhstan, and Uzbekistan. Turkmenistan is divided into five provinces: Ahal, Balkan, Dashoguz, Lebap, and Mary (UNICEF 2015). The country is 188,456.46 square miles of land. The majority of that land is desert (80%). The main source of water for the country is from the Amu-Darya River. The largest city and the capital of Turkmenistan is Ashgabat. The official language is Turkmen, and the unofficial language is Russian. The country is composed of many different ethnic groups, including Turkmen, Uzbek, Russian, and many minority groups, such as Indian. The life expectancy of Turkmen is about 65 years. The Health Index is 0.071. The adult literacy rate, starting at age 15 and above, is 99.6 percent (UNDP 2013).

Turkmenistan gained independence from the Soviet Union in 1991. Upon receiving independence, Turkmenistan adopted a single-party system, which was also adopted by Turkmenistan's first president, Saparmurat Niyazov, who served from 1991 to 2006. Turkmenistan's governance

and decision-making power has been concentrated in the executive branch. In 2006, Niyazov died, which resulted in a change of leadership and regime change. In 2007, President Berdimuhammedov became the second and current leader of Turkmenistan (Bohr 2014).

In 2014, the UN Development Programme (UNDP) ranked Turkmenistan 103rd out of 187 nations. Turkmenistan faces difficulty in reporting on gender inequality and poverty; therefore, it does not rank on the Gender Inequality Index or the Multidimensional Poverty Index (UNDP 2014). In Turkmenistan, women make up about 50 percent of the population. Some contemporary issues relevant to women in Turkmenistan include equality, accessible and inclusive education, accessible health care, gainful employment, an end to violence against women, and human rights equivalent to those outlined in international treaties.

The constitution of Turkmenistan ensures that women and men are legally guaranteed equality. In terms of property ownership and inheritance rights, women and men are legally guaranteed to be equal. While the government legally guarantees equality for women, it recognizes efforts need to be made to ensure equality is enacted in everyday life. In late January 2015, Turkmenistan implemented the first National Action Plan on Gender Equality, which is supported by UN Population Fund for 2015–2020 (UNFPA 2015). The National Action Plan will help to steer awareness and action between issues of gender and inequality. For instance, the National Action Plan includes steps such as raising awareness among women of their rights, increased gender-based legislation within Turkmenistan, fulfillment of international gendered treaties, addressing gender-based violence, increasing equality for women in the workplace, and better access to women's health care (UNFPA 2015). In April 2015, Turkmenistan was elected to the Executive Board of the UN Entity for Gender Equality and the Empowerment of Women (ECOSOC). The ECOSOC unanimously voted to support Turkmenistan's candidacy for 2016–2018. Turkmenistan's position with the ECOSOC confirms the country's commitment to promoting gender equality (MFA 2015).

Girls and Teens

For girls and teens, Turkmen culture perceives their role as learning to be homemakers. Mothers teach their daughters how to cook, clean, sew, and make textiles. In particular, mothers teach their daughters these skill sets because they are deemed necessary upon marriage. Girls and teens

may get married as a child or when they are older. Child marriages do occur in Turkmenistan. Sometimes children are forced to marry before the legal age of consent or are forced to marry of someone else's volition (Humanium 2012).

Girls and teens who do not stay at home to learn to be homemakers are often used for child labor. The cotton industry in Turkmenistan creates hazardous conditions where girls and teens, especially from rural areas, may be forced to work, sometimes for no money. In addition, there is a growing number of girls and teens who work in the sex industry. Some turn to sex work as a choice, while others are forced into prostitution when their family members set up brothels at which the girls are expected to work (Humanium 2012).

Education

In 2007, change in presidential leadership sparked hope for educational reform. For instance, by 2008, Turkmenistan had implemented several educational reforms, such as prioritizing education on the national level, undergoing a comprehensive Education Sector Review, increasing the age of compulsory education from 9 to 10 years, and establishing three curriculum guidelines in mathematics, geography, and vocational education (UNICEF 2008).

In terms of school attendance, Turkmenistan's primary school system has a 97 percent rate of attendance. While the primary school system's attendance is high, much of Turkmenistan's attendance challenges exist within the secondary and primary schools. For Turkmenistan's secondary school system, attendance is at a rate of 85 percent (UNICEF 2008).

Given that young people make up more than one-fourth of Turkmenistan's population, Turkmenistan's government found it important to teach life skills education. A life skills school curriculum is based on Ahmet Babajanov's advocacy for implementation of life skills education in Turkmenistan (UNICEF 2008). In 2002, Babajanov's began teaching life skills education in Turkmenistan as a part of a Young Adolescent Development Programme supported by UNICEF. While Babajanov did not have formal training as a teacher, he was able to hold hundreds of life skills courses in Turkmenistan. Because of his efforts, in 2007, he was able to teach 700 teachers and 20,000 children in life skills (UNICEF 2008).

Currently, Turkmenistan has roughly 1,800 secondary schools and 24 higher education institutions: 19 civil

institutions and 5 military institutions. The higher education institutions are governed by the Cabinet of Ministers of Turkmenistan. The cabinet is responsible for developing and implementing policies for fostering education that comply with governmental and international laws. To be admitted into a university, students must take and pass three entrance exams, one of which is an interview on the history of Turkmenistan. Once admitted, students are provided with scholarships and residence. In addition, students admitted to state institutions have free access to textbooks and teaching materials (European Commission 2012).

Academic staff at higher education institutions in Turkmenistan are structured as follows: junior lecturers, lecturers, senior lecturers, heads of departments, assistant deans, deans, vice-rectors (also known as vice-chancellors), and rectors (also known as chancellors). Some institutions of higher education have begun to develop specialty areas. For instance, Turkmen National Institute of World Languages has developed a Hindi language program, Turkmen State University specializes in archaeology studies, Turkmen State Institute of Economics and Management has created a state and local governance program, and Turkmen State Energy Institute has developed an industrial electronics studies program (European Commission 2012).

To be accepted into postgraduate studies, students must take and pass two exams. One exam is of a foreign language, and the second exam is the specialty area of the student applying to conduct postgraduate work. Once admitted, and to successfully complete their postgraduate studies, students must take and pass four exams of a foreign language, select a specialty area, publish at least three articles in their area, and complete a dissertation or study to be defended in front of their professors. After undergoing this training, the Turkmen government hopes graduates will help to continue to transform the country's socioeconomic position (European Commission 2012).

The Ruhnama

In 2001, President Niyazov wrote a book titled *The Ruhnama*, which translates into *The Book of the Soul*. The book is a combination of revisionist history, spirituality, and autobiography. The book includes poems that were intended to guide the spirituality or religion of the nation. In 2004, President Niyazov wrote a second edition of *The Ruhnama* that focuses on philosophy and morality. *The Ruhnama* has held great influence in Turkmenistan

because the government required the book to be sold in all bookstores and to be displayed in all government buildings and mosques. President Niyazov requested that *The Ruhnama* be held at equal weight as the Koran. In addition, *The Ruhnama* was required to be taught in schools. Students had to not only be knowledgeable of the book but also be able to cite exact passages. Furthermore, students had to take exams based on *The Ruhnama* to move forward in their education. Not only were students required to do so for school exams but also to qualify for a driver's license and for being employed by the government. *The Ruhnama* has been entrenched within civil society. It has been translated into 41 languages, including Belarusian, Beluchi, Braille, Croat, Dutch, English, German, Hungarian, Italian, Malay, Russian, and Zulu (Chronicles of Turkmenistan 2014).

In 2013, President Berdimuhamedow abolished *The Ruhnama* (Bohr 2014). To replace and alter *The Ruhnama*, President Berdimuhamedow instituted a 12-year educational system that began in the academic calendar year of 2013–2014 (Bohr 2014). While President Berdimuhamedow phased out *The Ruhnama*, the Chronicles of Turkmenistan suggests that he is working on phasing in his own replacement of *The Ruhnama*. For instance, President Berdimuhamedow has been working on his own manifesto that may, in the future, fill the social standing of *The Ruhnama* (Chronicles of Turkmenistan 2014).

Health

After the fall of the former Soviet Union, agriculture and industrial practices have had a catastrophic effect on the region, resulting in dramatic reduction of the Aral Sea, desertification, and contamination of the environment by pesticides, heavy metals, and organics. In particular, women and men face illness because they conduct agricultural labor. Turkmenistan has had several drawbacks that have prevented the country from rectifying these problems, including local health professionals who do not speak fluent English and are unable to collaborate with other organizations, a lack of standard reference materials, and the lack of collaboration with researchers and scientific organizations (Reynolds 1996).

Access to Health Care

In Turkmenistan, vaccines and immunizations are free. In 2002, Turkmenistan received a certificate for eradicating the poliovirus in its territory (Ministry of Foreign Affairs

of Turkmenistan 2013). At the same time, in a random sampling of the population of people 50 years old or older, 6,011 people in the study were found to not be receiving adequate treatment for cataracts. In Turkmenistan, cataracts are a major cause of bilateral blindness (54%) followed by glaucoma (25%) (Amansakhatov et al. 2002).

Maternal Health

From 1990 to 2010, the average infant mortality rate was 67 per 1,000 live births (Ministry of Foreign Affairs of Turkmenistan 2013). As a result, Turkmenistan has built health centers exclusively for maternal and child health. In addition, in 2011, Turkmenistan, under the advisement of the United Nations, implemented national programs educating mothers about breastfeeding. In 2015, the infant mortality rate was 1 death per 1,000 live births (World Bank 2015). However, life expectancy and infant mortality are still worse in Turkmenistan than in developed countries. Acute respiratory infections and diarrhea are the most common causes of infant mortality (UNICEF 2015). Turkmenistan's immunization rates for most common childhood diseases are at 97 percent. In addition, salt iodization in Turkmenistan makes it the first country to address iodine nutrition in all of Central Asia. Iron and folic acid dietary supplementation has been provided to more than 700,000 women, children, and girls (UNICEF 2015).

HIV/AIDS

The Turkmen government has not published accurate data about the incidence of HIV/AIDS in Turkmenistan, making it difficult to both treat and understand the severity of the disease in the country. In addition, Turkmenistan denies any new HIV infections in recent years. The lack of data may be associated with the government's National Programme on HIV/AIDS/STI Prevention from 1999 to 2003. In 2001, the government enacted a plan to lower the incidence of HIV infection. A National AIDS Centre was established, with the main office in Ashgabat and branches in each of its five regions. In 2004, 27 diagnostic laboratories were created that would perform HIV serological testing. The country also initiated information campaigns, which were used to target the youth, sex workers, and prisoners (Rechel and McKee 2007).

According to UNAIDS, by 2004, only two cases of HIV/AIDS were reported by the Turkmenistan government, while data from the UNICEF Turkmen Statistical Office

indicated that five cases were reported. Furthermore, between 2000 and 2004, Turkmenistan did not report a single case. In 2005, Turkmenistan reported zero cases of HIV/AIDS, while the former Soviet countries Uzbekistan and Kazakhstan had 2,198 and 964 new incidents, respectively. To assist in the prevention of HIV/AIDS/STI in Turkmenistan, the National Programme was extended in 2005 and was supported by UN agencies, the British embassy, and UNAIDS (Rechel and McKee 2007).

In 2006, UNAIDS estimated that 1,000 HIV/AIDS cases existed in Turkmenistan in 2005, which equates to 0.2 percent of the population. An unofficial source in the Ministry of Health and Medical Industry argues that there were more than 300 confirmed cases of the HIV infection in Ashgabat, the capital of Turkmenistan (Rechel and McKee 2007). This indicates that the true value of the entire nation's incidents of HIV/AIDS may be much higher. In particular, the Turkmen Initiative for Human Rights reported 68 HIV-positive individuals had been identified in Turkmenbashi, in the Balkan Providence (Fitzpatrick 2010). In 2010, the National Programme on HIV/AIDS/STI Prevention ended (UNODC 2010).

Currently, the potential for an HIV/AIDS epidemic may be high in Turkmenistan due to intravenous drug abuse, prostitution, and high rates of sexually transmitted diseases. Anonymous testing for HIV is not available, and no supportive infrastructure is in place for patients who are HIV-positive. Furthermore, Turkmenistan is furthering the risk of HIV/AIDS increasing drastically by not reporting a single HIV/AIDS infection in the last 15 years. Lack of transparency of data, screening, and preventative services indicate that those who are HIV-positive or who have AIDS are marginalized in Turkmenistan and that Turkmenistan is risking the health and overall well-being of its citizens (Kazatchkine 2014).

Cutaneous Leishmaniasis

Cutaneous leishmaniasis (CL) is a skin infection disease that is endemic in more than 70 countries worldwide. *Leishmania major* is responsible for zoonotic Old World CL. Between 2000 and 2009, 1,562 cases of CL had been reported. This occurred mostly in the south and eastern regions of Turkmenistan. Three species of CL have been found in Turkmenistan, which are the *Leishmania major*, *Leishmania tropica*, and *Leishmania infantum* (WHO 2009).

CL has a multitude of different clinical representations that mainly depend on the virulence of the strain. When

contracting CL, *L. major* produces one to seven lesions. These lesions can be papules, nodules, ulcers, and erythematous plaques. This strain can also cause a disseminated CL with nodular lymphangitis and superinfections. Without treatment, the lesions last three to eight months. They are self-healing but leave a keloid scar. A multitude of lesions could be explained by multiple sand fly bites (WHO Europe 2015).

Pentavalent antimonials is the first-line treatment for Old World CL. Antimonials are toxic, inconvenient, and relatively expensive. On the other hand, fluconazole can be used as a treatment. This drug is an oral medication and is better tolerated. In a randomized control trial in Iran, the high dose of 400mg/day had a higher efficacy than the low dose (Larrecche et al. 2013).

Multidrug-Resistant Tuberculosis (MDR-TB)

Tuberculosis (TB) has increased in Turkmenistan, especially after the Soviet Union collapse, when Turkmenistan was affected by economic decline and insufficient health systems (Cox et al. 2004). Today, Turkmenistan is 1 of 15 Central Asian countries that is greatly affected by multidrug-resistant tuberculosis (MDR-TB). Forty-nine percent of the population is either newly diagnosed with TB or being retreated. This is a significant problem for Turkmenistan, especially because 80 percent of their TB treatment funding comes from international sources (Kazatchkine 2014).

In the directly observed treatment strategy (DOTS) in the city of Dashoguz, which is the northern region of Turkmenistan, the first-line treatment of TB usually consists of a cocktail of medications that includes isoniazid, rifampin, ethambutol, streptomycin, and pyrazinamide. Resistance to the medications is seen in about 30 percent of new cases of TB and 62 percent of retreatment cases. The second line of treatment of TB usually consists of prothionamide, capreomycin, or ofloxacin. Prothionamide showed a 1 percent resistance in new cases and a 4 percent resistance in retreatment cases (Cox et al. 2004).

Employment

In 2002, 52 percent of women in Turkmenistan were employed in the agriculture sector, and 42 percent were employed in the nonagriculture sector. In terms of access to economic opportunity, in 2013, 80 percent of all men had access to work. In contrast, only 50 percent of women,

in 2013, had access to labor participation (World Bank 2015). To encourage the presence of women in the workplace, Turkmenistan has created two tax incentives for working women. For working women with three or more children, the tax incentive is that women pay 30 percent less in income tax. For working women with five or more children, the tax incentive is that women pay no income tax (United Nations 2006). For small businesses that retain a majority of female employees, Turkmenistan provides an indirect increase in workers' income as an incentive for hiring women (United Nations 2006). Labor laws in Turkmenistan prevent employers from the following: refusing to hire women, paying women less or firing women who are pregnant, and paying less or firing women who miss work related to their children under the age of 14 years old (United Nations 2006).

With poverty remaining high in Turkmenistan, women have been forced into the sex industry, which has been increasing. The chairman of the Turkmen Initiative for Human Rights stated, "Never before have so many women and even under-age schoolgirls worked the streets or gathered in special places, offering sexual services" (IRIN 2005). While the government provides incentives for women in the workplace, many women become prostitutes due to the level of poverty among Turkmen citizens (United Nations 2006).

Family Life

In Turkmenistan, women are often relegated to the private sphere of the home. Sometimes women may go to each other's homes to socialize and assist with housework. Because women are expected to stay home, it is difficult for women to attain work or seek roles outside of the home. For women who do attain work outside the home, they are given up to 112 days of maternity leave, and 100 percent of their wages are paid while on leave. Once paid maternity leave has expired, women are given the option to take unpaid leave until their child turns three years old (World Bank 2015). In the instance men are raising a child or children without a mother, the benefits of maternity leave for women are extended to men (World Bank 2015).

There are no official statistics that reveal the level of domestic violence in Turkmenistan. Therefore, it may be difficult for Turkmenistan to develop an effective plan to address the issue (UNFPA 2015). Furthermore, the high poverty level in Turkmenistan often forces mothers and

daughters into prostitution. This level of poverty and prostitution affects family life in Turkmenistan because when fathers and brothers do not make enough money to provide for the family, wives and daughters must find ways to support their families (IRIN 2005).

Politics

Turkmenistan gained independence from the Soviet Union in 1991. Upon receiving independence, Turkmenistan adopted a single-party system, which was adopted by Turkmenistan's first president, Saparmurat Niyazov, who served from 1991 to 2006. Turkmenistan's governance and decision-making power has been concentrated in the executive branch. Under President Niyazov, the Parliament consisted of exclusively one party. In essence, the Parliament acted as a presidential supplement. For local democratic governance, governors, also known as *hakims*, are appointed by the president (Bohr 2014).

Turkmenistan is known for its production of cotton and oil and for having the world's fifth-largest reserves of natural gas. Between 2000 and 2006, Turkmenistan experienced significant economic growth, where the country's gross domestic product (GDP) grew by more than 500 percent. In 2005, Turkmenistan had the second highest GDP in Central Asia (UNICEF 2008). While Turkmenistan has had vast economic growth, much of the country remains in poverty, with less than 44 percent of Turkmenistan's population living on less than USD\$2 a day (IRIN 2005), and 40 percent of Turkmenistan's population is under the age of 15 (UNICEF 2008).

Because of power primarily existing in the executive branch, Turkmenistan has been prone to an authoritarian government and corruption. In the 2012 *Human Rights Report* on Turkmenistan, the U.S. State Department argues that while Turkmenistan situates itself as a secular democratic nation, the country truly functions under an authoritarian government where President Berdimuhammedov imposes his own rule of order. For instance, the U.S. State Department reports that under President Berdimuhammedov's leadership, there have been several human rights violations, such as torture, arbitrary arrest, and disregard for civil liberties, which include freedom of assembly and freedom of speech and press (U.S. State Department 2012). Furthermore, in 2013, President Berdimuhammedov appointed his relatives and family friends to top government positions in the Ahal Providence, exemplifying corruption (Bohr 2014).

The Union of Women of Turkmenistan has roughly 1 million members and is the most influential women's organization in the country. The union promotes the roles of women within politics, culture, and society. Women also hold influence within trade union organizations, where 45 percent of organizations are led by women. In 2006, women held influential roles within politics. For instance, women have held the position of deputy chair of the Parliament, deputy chair of the Cabinet of Ministers, deputy ministers, and have been on the Parliament Committee (United Nations 2006).

In December 2013, Turkmenistan held its first multi-party parliamentary elections of two registered parties. While this was the first time two registered parties existed in Turkmenistan, they were essentially symbolic and non-competitive because all the candidates had been vetted by the government, and their advocacies were progovernment. Because of mere symbolism in Turkmenistan's parliamentary elections, the country's rating for the electoral process is 7.0 (Bohr 2014).

In terms of civil society, all religious congregations, public associations, and political parties must be registered with the government. Any political entities that are not registered face a fine, short-term detention, and potential confiscation of property (Bohr 2014). Because of Turkmenistan's stance on limiting political freedom, the country's rating for civil society is 7.0. Furthermore, domestic and foreign nongovernmental organizations (NGOs) are extensively monitored by the government (Bohr 2014).

In terms of independent media, the government controls content. For instance, the primary role of independent media is to praise the country's president. Furthermore, the government limits Internet access and blocks Web content that is perceived as critical or dissenting against Turkmenistan. Because of Turkmenistan's control of media and the Internet, the country's rating for independent media is 7.0 (Bohr 2014).

Religious and Cultural Roles

Ninety percent of the population of Turkmenistan is Muslim; about 9 percent is Christian, primarily Orthodox; and about 1 percent is a mix of various religions that may be unregistered, some unknown. Part of the 1 percent are Jehovah's Witnesses, Jews, Roman Catholics, nondenominational groups, and Evangelical Christians. A majority of those who are Muslim are Sunni with some Shia

(Asia News 2012). Prior to Turkmenistan's independence, only four mosques existed. Now, there are more than 400 mosques in Turkmenistan, making Islam the predominant religion in Turkmenistan (U.S. State Department 2015).

In terms of government and religion, Turkmenistan stresses its government as a secular nation that supports freedom of religion. For instance, in 1992, Turkmenistan included in its constitution the Law on Freedom of Conscience and on Religious Organizations in the Turkmen Soviet Socialist Republic. While the government emphasizes religious freedom, Turkmen laws and policies mandate that all groups must register with the government to gain legal status. If religious groups are unregistered, they are engaging in illegal activity and are subject to fines and jail time. To be deemed registered, religious groups must have approval from the government. Often, religious groups have reported that they have been unable to register, or when they have been able to register, the government placed stipulations such as not being able to own land to construct spaces for religious gatherings or not being able to distribute or print religious material (U.S. State Department 2015).

Islam plays a fundamental role in Turkmenistan's politics. For example, President Niyazov ordered that basic Islamic principles must be taught in all schools. By emphasizing Islamic principles, the Turkmenistan government deemphasizes all other religions that are not Islam. In addition, while the government does not have an official religion, it has funded the construction of mosques and approved senior Islamic cleric appointments. In contrast, Russian Orthodox churches and other religious groups have not received governmental funding and have been denied approval for their religious leadership appointments (U.S. State Department 2015).

Minority religious communities, both registered and unregistered, face hardship when they attempt to acquire facilities that can be used for worship. When minority religious communities cannot acquire facilities, they cannot congregate together in an alternative space, such as a home, because Turkmen law prevents it. For instance, the U.S. State Department argues that the housing code states that homes cannot be used for any activities other than for living. In addition, in 2003, a religion law was created that banned private teaching of religion (U.S. State Department 2015). This created another obstacle for minority religious groups, which had to acquire facilities in to educate individuals about their faiths.

An implication of the 2003 religion law is that Islam became the *de facto* religion taught in schools. Parents

belonging to minority religious groups were given few options in ensuring schools educated their children in faiths other than Islam. Obstacles are also placed before these parents when the government prevents them from homeschooling their children because homeschooling is reserved for children with a disability or severe illness (U.S. State Department 2015). In essence, minority religious groups face many obstacles.

One minority religious group that often faces wrongful imprisonment is Jehovah's Witnesses. In 2012, nine Jehovah's Witnesses were falsely imprisoned in Turkmenistan. Six of the eight men, Merdan Amanov, Pavel Paymov, Suhrab Rahmanberdyev, Amirlan Tolkachev, Matkarim Aminov, and Dovran Matyakubov, were imprisoned for objecting to serve in the military, which their faith prohibits, and they were falsely arrested on two additional charges based on religion. Two other men were imprisoned for their religious views, Aibek Salayev and Bahram Shamuradov. They were placed in a harsh facility where they were abused and forced to live in poor conditions. The ninth man, Ruslan Narkuliev, was imprisoned for objecting to serve in the military a few weeks prior to receiving amnesty. After two years of being detained, on October 22, 2014, President Berdimuhamedov released eight of the nine men. Ruslan Narkuliev still remains in prison (JW.org 2014).

Issues

LGBT Rights

In Turkmenistan, male homosexuality is punishable by up to two years in prison under Article 135 of the Criminal Code of 1997. The code mentions male homosexuality, but it does not mention same-sex relations between women. The government perceives male homosexuality as a mental disorder. As a result, gay men can be placed into psychiatric institutions to receive "treatment." Fearing prosecution and potential bodily injury, the LGBT community in Turkmenistan is invisible and disconnected (International Refugee Rights Initiative 2015).

Attempts have been made to bring international attention and awareness to LGBT issues in Turkmenistan. For instance, on December 9, 2008, during a working group review of sexual orientation and gender identity, in an interactive dialogue with Turkmenistan, Sweden and Canada asked whether the government was going to change or repeal Article 135 of the Criminal Code of 1997. Sweden,

Canada, and the Czech Republic then recommended that Turkmenistan consider adopting a policy that promoted tolerance and nondiscrimination of gay, lesbian, bisexual, and transgender individuals (ARC International 2009).

U

Uzbekistan

Overview of Country

The Republic of Uzbekistan is a landlocked country located in Central Asia that borders Kazakhstan, Tajikistan, Kyrgyzstan, Afghanistan, and Turkmenistan. The country consists of approximately 172,700 square miles (447,400 sq. km), and it has a dry terrain that is partly composed of mountains and the Kyzylkum Desert. As of January 1, 2012, the population of Uzbekistan was 28,541,400 (UNICEF 2012).

In 2015, the UN Development Programme (UNDP) ranked Uzbekistan 114th out of 188 nations based on the Gender Inequality Index, although the value determined by these factors is incomplete due to a lack of adequate information on the percent of the population that has some secondary schooling. One factor that helped to determine Uzbekistan's placement at 114th on this list is the lack of women employed in the labor force; only 48.1 percent of women are employed. Another contributing factor is the dearth of women in Parliament; only 16.4 percent of Parliament seats are held by women (UNDP 2015).

The area that is now Uzbekistan became part of the Soviet Union in 1924, taking the name of the Uzbek Soviet Socialist Republic. When the Soviet Union collapsed and broke up in 1991, Uzbekistan declared independence, and the official name became the Republic of Uzbekistan. The

primary language spoken in Uzbekistan is Uzbek, and Russian and Tajik are spoken by smaller percentages of the population. The majority religion is nondenominational Muslim, Sunni being the majority denomination, and the majority ethnic identity is Uzbek. Minority ethnic identities include Russian, Tajik, Kazakh, Karakalpak, and Tatar (CIA 2016).

Although the government of Uzbekistan has laws in place to protect a wide variety of human rights, some groups argue that the country does not have an ideal human rights record, claiming that there is strict governmental control over individuals' religious and political opinions (HRW 2016). Other contemporary issues that are relevant to women in Uzbekistan include equal employment opportunities, women's and family health care, and equal access to religious education.

Girls and Teens

Family Roles

A 2009 report from the UN Committee on the Elimination of Discrimination against Women (CEDAW) explains that young women in Uzbekistan experience gender stereotypes within their patriarchal family units due to cultural habits and the traditional messages spread by mass media (CEDAW 2009, 3–4). These traditional values stress that women of all ages should be subordinate to their fathers or husbands and that women belong in the home with their

families instead of participating in public roles. Women are encouraged to be submissive while men take on the roles of provider and protector. The report states the concept of social protection can be used as justification for oppressing young women through various acts, such as early and arranged marriages, polygamy, and domestic violence.

Literacy

Girls and teens in Uzbekistan enjoy a high rate of literacy, and the reading abilities of young women are on par with the reading abilities of young men. As an entire country, Uzbekistan's literacy rate is very high at 99.4 percent (UNICEF 2012). This high literacy rate is especially evident in the country's population of young adults, with only 0.3 percent of people ages 16–19 being illiterate (CEDAW 2000, 4). Uzbekistan's young people have achieved this high rate of literacy by attending mandatory primary and secondary education.

Education

Primary Education

Uzbekistan's Constitution guarantees that every citizen has the right to education. The schooling of children and young adults is under the supervision of the government, which ensures women receive equal education and educational opportunities. Children can enter state schooling as early as age 3 or 4, and they complete their primary education around age 10 or 11. Half of the students in Uzbekistan's primary schools are girls. This state-supervised primary education aims to provide boys and girls with an equal initial education (CEDAW 2004, 18). The percentage of boys and girls enrolled in these schools is indeed close to equal. In data collected from 2008 to 2012, statistics show 96 percent of boys were enrolled in primary school, compared to 93.2 percent of girls (UNICEF 2012).

Secondary Education

Free access to secondary education is also guaranteed to all citizens of Uzbekistan under the country's Constitution. Children enter secondary schooling around age 11 or 12 and continue to receive secondary education until age 16 or 17. As is the case with primary schooling, Uzbekistan's government seeks to provide an equally advantageous education for both male and female students. The net attendance ratio for boys attending secondary school in

2008–2012 was 91.4 percent, while the same ratio for girls was 89.5 percent (UNICEF 2012). Although this shows that the percentage of boys and girls attending secondary school is not as high as those attending primary school, these statistics still indicate roughly equal percentages of male and female students pursuing secondary schooling.

By providing free compulsory primary and secondary education to all school-aged children, Uzbekistan has achieved a 99.4 percent literacy rate, from 97.7 percent in 1991, due in large part to these standardized educational advances (CEDAW 2004, 20).

Postsecondary Education

After students have completed their compulsory secondary education, they can choose to enter an academic grammar school to prepare them for university-level schooling, or they can choose to attend a vocational school to prepare them for a specific trade or occupation. Both choices of postsecondary education are three-year programs. After graduation, people who decided to attend an academic grammar school are then able to pursue higher education in the forms of baccalaureate, master's, and doctoral degrees. If individuals wish to continue their education after achieving a PhD, they may pursue further education at the postdoctoral level (CEDAW 2004, 19).

Job Training

Male and female students in postsecondary education often pursue training that corresponds to Uzbekistan's stereotypical gendered division of labor that divides professions into "masculine" and "feminine" occupations. Most women seek training and education for traditional female occupations, such as education and health, while men traditionally pursue occupations in industry, agriculture, construction, and education (CEDAW 2004, 21).

Health

Health Care Access and Overview

The life expectancy of men and women in Uzbekistan in 2012 was 68.1 years (UNICEF 2012). The government emphasizes the importance of both individual and family health and access to health care through education and budgetary appropriations. A 1998 presidential decree created the State Programme for Reform of the Health System that focuses on encouraging citizens to pursue a healthy lifestyle and utilize preventive medicine.

Specific measures in this program target young women and are taught to school-aged children throughout their education. These efforts aim to discourage young women from entering into early marriages and having children at a young age. Instead, the programs encourage young women to take preventative measures to avoid unwanted pregnancies and advocate for young teens and young adults to pursue healthy lifestyles (CEDAW 2004, 25–26).

Gender, Power, and the Sexual Dynamics of HIV/AIDS

According to data, 0.1 percent of the adult population of Uzbekistan, or about 30,000 people, had HIV in 2012 (UNICEF 2012). In 2002, Uzbekistan's government adopted the National Programme to Combat HIV/AIDS. As a result, schools strive to inform children on how to prevent HIV/AIDS and sexually transmitted infections (STIs) throughout both primary and secondary education. Older students also partake in events for World AIDS Day (CEDAW 2004, 26).

Although information about HIV/AIDS and STIs is often presented simultaneously to students, the country's efforts mostly focus on the risk that accompanies the use of infected needles instead of the sexual dynamics of these issues. This has resulted in the establishment of medical facilities and help centers for drug users in an effort to curb both drug abuse and the spread of infected needle usage (CEDAW 2004, 26). Despite these efforts, only 27.2 percent of female adolescents studied from 2008 to 2012 had comprehensive knowledge of HIV (UNICEF 2012).

Reproductive Health

Both the Family Code of the Republic of Uzbekistan of 1998 and Uzbekistan's Constitution guarantee the protection of women's reproductive rights (CEDAW 2004, 13). The government strives to provide women with easy access to adequate health care. Women and their families have access to midwifery, gynecological, and pediatric services, and educational centers have established research institutes for the study of women's health and reproductive issues and diseases (CEDAW 2004, 27).

Childbirth and Maternal Health Care

The government has focused on improving women's health care by emphasizing the importance of health to the entire family unit. This has resulted in a sharp

decrease in maternal mortality from 65.3 deaths per 100,000 live births in 1991 to 32.2 deaths per 100,000 live births in 2003 (CEDAW 2004, 23). UNICEF data from 2008 to 2012 shows that the vast majority of women received adequate delivery care during childbirth. The data show that 99.9 percent of these deliveries included a skilled attendant present at the birth, and 97.3 percent of deliveries took place within a health care institution (UNICEF 2012).

Employment

Typical Jobs and Careers

The government of Uzbekistan ensures an equal right to work for women and men. The Constitution itself further safeguards an individual's right to choose his or her own occupation freely and guarantees fair working conditions for all employees (CEDAW 2004, 22).

In addition to the aforementioned fields of education and health, women often apply for jobs in the areas of art, science, culture, and scientific service (CEDAW 2004, 22). In an attempt to increase the occupational opportunities for women, Uzbekistan's education officials have been actively trying to increase women's access to and involvement in growing industries such as telecommunications and information technology (IT). In Uzbekistan's capital city of Tashkent, the Tashkent University of Information Technology has created a new center for women who wish to pursue training in various IT fields. This center was established with the hope that increasing the number of women pursuing this type of technological training will help to bring these occupational fields closer to employing men and women in equal numbers (CEDAW 2004, 22).

The Business Women's Association of Uzbekistan also seeks to educate women through a wide variety of courses regarding women's entrepreneurship and home business opportunities. The women who participate in this type of training often achieve success in their careers. For example, in 2004, 1,986 women created their own home-based businesses, and 1,276 established their own private firms (CEDAW 2004, 22).

Discrimination and Income Disparity

State officials have been working to increase the number of women in traditionally "masculine" occupations, such as jobs in the athletic, agricultural, and transport industries.

In addition, the state has implemented programs to improve the economic viability of women's occupations in rural areas of Uzbekistan. In 2004, the State Statistics Committee released data that showed that women made up 43.9 percent of the 9,333,000 individuals working in Uzbekistan (CEDAW 2004, 28). Although this report shows that women make up nearly half of the workforce, a 2015 UN report shows that only 48.1 percent of women are employed (UNDP 2015).

Labor Regulations

There is a particular set of labor rules and regulations that apply to women in Uzbekistan. There are limits placed on the weight of objects that women are permitted to lift for their jobs, there is a list of jobs with disagreeable working conditions for which employers are not permitted to hire women, and there are regulations in place to protect pregnant women and mothers in the workplace (CEDAW 2004, 29).

Maternity Leave

The Labour Code allots 126 days of maternity leave to pregnant women, during which they earn 100 percent of their salary (SIGI 2016). Maternity leave is intended to help women balance their work lives and their roles as mothers. The government of Uzbekistan also implemented two programs in the mid-1990s to assist families with children and to families that needed financial assistance. These programs have resulted in instances where women's pregnancy and maternity leaves are extended by one or two months at the expense of their employers and have provided supplementary leave for more than 600,000 women (CEDAW 2004, 30).

Family Life Marriage

The Family Code of the Republic of Uzbekistan of 1998 states that girls must enter into marriage voluntarily or else the marriage is void. The code sets the marriage age at 18 years for men and 17 years for women. Although this code is in place, it is not universally followed throughout Uzbekistan. A study conducted by UNICEF from 2002 to 2012 found that 0.3 percent of girls were married by age 15, while an additional 7.2 percent of girls were married by age 18 (UNICEF 2012). This same study found that 1.8

percent of the female population had given birth by age 18 between the years 2008 and 2012 (UNICEF 2012).

Uzbekistan also has laws that prohibit polygamy (CEDAW 2004, 13). According to a 2003 special investigations report produced by the Ministry of Internal Affairs, there were 42 recorded cases of polygamy and 27 instances of forced marriage or forced prevention of marriage committed that year (CEDAW 2004, 34).

Divorce

Divorce is legal in Uzbekistan under the Family Code, but women cannot get a divorce if their neighborhood committees, called *makhallyas*, do not approve of it. These *makhallyas* serve their communities by helping to deal with family issues and mediate familial conflicts. Although these *makhallyas* do not usually restrict an individual's access to divorce, the Coalition of Uzbek Women's Rights nongovernmental organizations (NGOs) stated that these committees have encouraged spouses to rethink their decisions to pursue a divorce. The government has created an advisory position to advocate for women's issues for these *makhallyas*. In most instances, these committees approve an individual's request for a divorce and give them permission to take their case to the appropriate civic office or court (SIGI 2016).

The State Committee of the Republic of Uzbekistan on Statistics released a report in 2012 that stated there were 2,567 divorced men and 1,981 divorced women who had obtained higher education and 162 divorced men and 196 divorced women among adults who had not completed higher education (SIGI 2016). These figures seem to indicate that divorce is more common among the educated population.

Following a divorce, a childless woman is expected to return to her parents' house. A divorced woman may only live independently if she has children. Uzbekistan's Family Code states that men and woman have equal parental authority over their children during marriage and after a divorce, but children of divorced parents are routinely placed with the mother (SIGI 2016).

Property that a married couple acquired throughout their marriage is considered joint property, so divorced couples split it between themselves. Additionally, after a divorce, a spouse retains the property that he or she had acquired prior to the marriage. There have been reports of divorce courts refusing women's legal access to the joint property they had acquired with their husbands

during their marriage. The Coalition of Uzbek Women's Rights NGOs argue that this is indicative of the ability of a wealthy husband to bribe divorce courts into denying his wife her share of the property after the divorce (SIGI 2016).

Household Roles and Responsibilities

Women's household roles and responsibilities align with Uzbekistan's traditional view of the woman as a housekeeper and nurturer. Women are traditionally expected to raise their children and assist other family members, ensure that the family has adequate food and clothing, and keep the home in satisfactory condition. Although some women see these traditional roles as subordinate to the typical male breadwinner role, other women see power in their roles and responsibilities within the home. These women emphasize that they hold influence over their husbands as advisers, giving their husbands the guidance and the motivation that they need to successfully provide financial security for the family (Tursunova 2014, 105).

Gender Roles and Family Structure

Stereotypical gender roles in Uzbekistan affect women's positions in the family. Men are typically seen as the heads of the family, while women are often viewed as being dependent on men economically and socially. Because women often occupy lower-paying jobs, they are financially and materially dependent on their husbands. According to a poll conducted by the Centre for the Study of Public Opinion, this often results in women feeling that they occupy subordinate positions in both their own households and in society as a whole (CEDAW 2004, 32).

The government has put legislation in place to help counteract this unbalance in the family system. The government adopted the Family Code legislation in 1998 in an effort to increase mutual love, respect, and assistance between spouses and within family units (CEDAW 2004, 32).

Contraception

The government provides women with free access to contraceptive devices. This has resulted in a major increase in the use of contraception, from 13 percent of women using birth control methods in 1991 to 62.3 percent using birth control methods in 2003 (CEDAW 2004, 24).

Politics

LGBT Rights

Uzbekistan does not provide any rights or protections for the lesbian, gay, bisexual, and transgender (LGBT) community. Instead, LGBT citizens of Uzbekistan may be punished for their sexuality and gender identities. Voluntary sexual intercourse between two men is illegal in the country. According to Article 120 of the Criminal Code of the Republic of Uzbekistan that went into effect in 1994, men charged with same-sex intercourse may be punished with up to three years in prison (Legislation Online 1994).

Land Rights

Because Uzbekistan is a patrilineal society in which families draw strong connections to the husband's relatives, women are often limited in their ownership of property. Family homes and resources are often passed down through the male line and are usually given to sons, although daughters are permitted to inherit property, too. When a woman is married, she is likely to strengthen the relationship she has with her husband's family and often resides with her in-laws immediately following her marriage (Barrett 2007, 422). Although these traditions can have a strong influence over women's access to land, women legally have an equal opportunity to lease land. A 2002 Demographic and Health Survey, however, showed that only 1.6 percent of women reported that they leased their own land (SIGI 2016). Most women acquire their access to land through their membership in a family unit.

Women's access to land rights and the ownership of property is also limited due to occupational stereotypes that accompany the country's thriving agricultural industry. Men dominate the better-paid positions in the agricultural occupations, while women often resort to poorly paid farming positions, such as cotton picking. This results in men having control over the farms and the family units living on these farms, restricting women from access to land and property rights to the very communities and families that they continuously work to develop (Tursunova 2014, 57–58).

Judicial System

Women are given the same legal rights as men according to Uzbekistan's Constitution. Men and women have identical legal capacities and are expected to be guaranteed equal treatment in all stages of judicial procedures (CEDAW 2004, 31).

The number of women working within Uzbekistan's judicial system as judges and other officials has also increased in the past two decades. A woman was selected to serve as the chief justice of the Supreme Court in 2004 (CEDAW 2004, 10).

Structure of the Government

Uzbekistan is a republic that is made up of executive, legislative, and judicial branches. The president is elected by Uzbekistan's citizens through a majority vote. The legislative assembly, referred to as *Oliy Majlis*, consists of a 100-member senate; 84 members are elected by majority vote, and 16 are appointed by the president. The second body of the legislative branch—the legislative chamber—consists of 135 members who are elected by majority vote and 15 additional members elected by the Ecological Movement of Uzbekistan (CIA 2016).

One particular office in Oliy Majlis, the Office of the Commissioner for Human Rights, works to improve the condition of women in Uzbekistan by working toward gender equality (CEDAW 2004, 16).

Participation in Government

Since its creation in 1991, Article 117 of the Constitution of Uzbekistan has guaranteed women the right to vote for elected officials and the right to be elected to public office (CEDAW 2004, 9). The government of Uzbekistan has taken steps in recent decades to improve women's participation in the government. For example, in March of 1995, the president of Uzbekistan issued a decree that created the post of deputy prime minister for the social protection of the family, mothers, and children (CEDAW 2004, 16). This position was created to increase women's involvement in social issues.

These efforts to enhance women's participation in government have seen some success, but women's equal representation is still far from being achieved. In 2004, one deputy prime minister of Uzbekistan was a woman, and women made up only 9.5 percent (23 people) of the legislative body (10). Women are more active in local governments. The local 2003 elections saw 734 women elected to positions in their local *makhallyas*, and 19,800 women serve as advisers to *makhallya* chairmen (16). The state government is also working to encourage and promote women's work on an international level through international conferences and roundtable discussions concerning the status of women (16–17).

Women's Associations, NGOs, and Nonprofits

The Women's Committee of Uzbekistan holds a series of seminars regarding women's rights in marriage to help shed light on issues such as marrying relatives and reproductive health (2004, 13). This group actively promotes and develops NGOs dedicated to gender equality.

The *Mekhr* alliance is made up of more than 50 women's NGOs that fight for women's rights and take part in gender research (16). Along with governmental and international organizations, these NGOs “hold seminars, round tables, conferences and meetings on the subject of raising women's knowledge of the laws and increasing gender awareness in civil society on issues of violence against women” (33).

Some reports, however, indicate that Uzbekistan officials may treat NGOs harshly at times. For instance, Uzbek courts suspended the NGO Freedom House for six months in 2006 for reporting on the Andijan massacre and for providing free Internet access to Uzbekistan citizens following the event. In a 2005 massacre in the city of Andijan, government forces ambushed and killed over a hundred protestors who were opposing poverty and governmental repression (HRW 2016).

Religious and Cultural Roles

Women and Islam

The majority of Uzbekistan's population is Muslim, predominantly nondenominational or Sunni, and the government controls official religious mandates. Women cannot achieve the position of imam, the term identifying the male leaders of mosques, but women can pursue education and training to become religious leaders. Two educational centers, one in the capital city of Tashkent and one in the city of Bukhara, are reserved for female students. Women can also attend school at the Islamic Institute and the Islamic University in Tashkent (Barrett 2007, 420).

The 1998 law On Freedom of Conscience and Religious Organizations requires that all forms of religious education be government-controlled and that religious teachers use only government-produced religious materials (419). All religious schools must be registered with the government, including private religious home schools, or they are considered illegal.

The government of Uzbekistan constructed many mosques in the 1990s, but these mosques were often built without providing physical space for women who wished

to use the mosque for their own worship. In a response to this lack of physical space, some women decided to resist gendered spatial segregation and created their own spaces within these mosques, while other women decided to use their own homes as sacred spaces (Tursunova 2014, 25). Women who use their homes as places of worship are thus able to transform their domestic spaces by giving them this dual purpose. This usage of the home also reflects Uzbekistan's stereotypical social constructs and family roles for men and women. Men are permitted to worship at the public space of the mosque, but women are often restricted to worshipping and learning about Islam in their own homes (Barrett 2007, 418).

Otins

There is a growing movement of female religious preachers, referred to as *otins*, who preach to women and girls in Uzbekistan and provide teaching through Koranic classes. These female religious leaders contend that Islam promotes gender equality, and the Koran supports social justice (Tursunova 2014, 6). By spreading their interpretation of Islamic scriptures and advocating for other women to have a personal relationship with Allah, *otins* seek to empower other women. *Otins* use traditional ideals of Muslim selfhood to encourage women to support peace and reconciliation within their communities (28).

Religious women and men can both participate in healing rituals, but women alone traditionally conduct some rituals. These women associate themselves with particular female saints who were known to be capable mediators in situations of family conflict or pain and suffering (30). These women can provide help for a wide range of people, including mothers during childbirth, people experiencing troublesome unemployment, and families that are struggling with internal conflicts or issues (31).

Although *otins* have gained in popularity with some citizens of Uzbekistan, others do not approve of these religious leaders' teachings. Those who disapprove argue that *otins* present their own localized teachings of Islam instead of the conventional teachings promoted by the government. For example, a local Women's Committee in the village of Ok Yul in the region of Tashkent criticized the *otins* for both their teachings and their interpretations of scriptures (24–25). Although the interpretations that the *otins* follow may not be universally accepted throughout the country, their understandings help to put women on equal footing with men in the realm of religion.

Issues

Trafficking

In 2008, the U.S. Department of State listed Uzbekistan as a source country for victims of human traffickers (U.S. Department of State 2008). A report stated that women and girls are taken from Uzbekistan for use in the commercial sex trade, both within Uzbekistan and internationally.

The government of Uzbekistan adopted a comprehensive antitrafficking law in March of 2008. This law helps the government prosecute and jail traffickers while also providing assistance to victims. According to the U.S. Department of State report, however, a member of Uzbekistan's Parliament resigned over sex-trafficking allegations, and there are additional unconfirmed allegations against other members of the government (U.S. Department of State 2008).

Domestic Violence

Uzbekistan does not have specific legislation addressing the issue of domestic violence. The criminal code loosely covers all types of violence, but a 2005 report showed that domestic violence prosecutions were usually handed down in cases of death or extreme injury to the victim (SIGI 2016). In some families, husbands have traditionally used violence against their wives to signify the position of the dominant spouse, resulting in domestic violence being tied up in cultural and familial traditions. For this reason, domestic violence can be a taboo topic in Uzbekistan society and is sometimes instead referred to as *family conflict* instead of a societal issue (SIGI 2016).

Perhaps due to these traditional social constructs and a lack of explicit legal protections, domestic violence continues to be an issue in Uzbekistan. For example, a 2003 special investigations report written by the Ministry of Internal Affairs stated that there were 228 cases of premeditated murder committed in a domestic setting (CEDAW 2004, 34). According to one analysis that compared the number of criminal cases brought against perpetrators of violence against women, the number of cases increased by 43.6 percent between 2002 and 2003 (CEDAW 2004, 32).

Some people tend to justify domestic violence. According to a UNICEF study conducted from 2002 to 2012, 59.4 percent of men and 69.6 percent of women justified wife beating. In this same 2012 UNICEF study, 62.8 percent of male adolescents justified wife beating, compared to 63 percent of female adolescents. These statistics show a

slight increase for male adolescents and a slight decrease for female adolescents justifying violence, possibly indicating less tolerance for domestic violence among younger women (UNICEF 2012).

Sexual Assault and Rape

Rape became punishable by death according to Uzbekistan law in 1998 (CEDAW 2004, 12). However, there is no specific prohibition of spousal rape in Uzbekistan's criminal code due to the viewpoint that a man should have sexual access to his wife's body at all times following marriage. Female victims of rape may be discouraged from reporting their experiences due to shame or fear of retaliation or stigmatization (SIGI 2016).

In 2003, the Ministry of Internal Affairs produced a special investigations report stating that there were 576 cases of rape that year (CEDAW 2004, 34). Another report, issued in 2008, indicated a rise in the instances of reported rape, with 829 criminal rape trials in 2007 (SIGI 2016).

V

Vietnam

Overview of Country

Vietnam (formally the Socialist Republic of Vietnam) is located in Southeast Asia on the Indochina Peninsula. Vietnam is bordered by the South China Sea to the southeast, Cambodia to the southwest, Laos to the northwest, and China to the north. The country is shaped like the letter S and is approximately 128,565 square miles (332,698 sq. km) in area. Northern Vietnam consists of highlands, and southern Vietnam consists of mountains, forests, and lowlands. Northern Vietnam is hot during the summer season, yet cool during the winter season. Southern Vietnam is hot year-round (York 2012, 170). As of 2014, the population in Vietnam was 90,730,000 (World Bank 2016). Vietnam is an agriculturally centered country; approximately 70 percent of the population lives in rural areas. The World Health Organization (WHO) reports that urban Vietnam is growing at a faster rate in population than rural parts of the country (WHO 2015).

Vietnam is made up of many different ethnic groups. The Kinh ethnic group comprises 86 percent of the country's population and is the majority ethnic group. Another 53 ethnic groups inhabit Vietnam, including Tay (1.9%), Thai (1.8%), Muong (1.5%), Khmer (1.5%), Mong (1.2%), Nung (1.1%), Hoa (1%), Dao (0.9%), and Gia Rai (0.5%). According to the UN Population Fund (UNFPA), Vietnam

makes efforts to support ethnic diversity and to recognize all ethnic groups as equal (UNFPA 2011).

Vietnam became an independent country in 1954 after being a part of Imperial China for more than 1,000 years. By 1858, France had begun to conquer the country, and in 1887, Vietnam became a part of French Indochina. However, the country defeated France in 1954, during the First Indochina War, and declared its independence. Subsequently, the country was divided into the communist North and the anticommunist South. As conflict between the two sides of the country grew, so did the U.S. military and economic aid to the South side—otherwise known as the Vietnam War. The North Vietnamese forces claimed victory in 1975, and the North and South were unified under communist rule. However, because of conservative leadership, the country remained politically isolated and poor. Beginning in 1986, the Vietnamese government issued economic and structural reforms for the country to be more competitive with economies around the world. However, the Central Intelligence Agency (CIA) reports that Vietnam's communist leaders still limit political expression and the rights of citizens (CIA 2015). Today, WHO considers Vietnam as a lower middle-income country, which has decreased international funding coming into the country (WHO 2015). Even though the country is considered communist, there are many capitalist aspects present.

In 2015, the UN Development Programme (UNDP) ranked Vietnam 60th out of 187 nations based on the

Gender Inequality Index (0.308). Even though the economy changed as a result of reforms, gender roles and values have been slower to change. Vietnam has made strides in gender equality; yet, women in the country still face barriers to health care, a high risk of violence both inside and outside the home, and obstacles in achieving careers on the same level as men in the country. Nevertheless, Vietnam continues to work toward ensuring gender equality for its citizens.

Girls and Teens

Relative to Vietnam's total population, children up to age 14 make up 24.3 percent of the population. Girls make up less than half of children in this age group, as only 11.5 percent of the Vietnamese population consists of girls ages 14 and younger (Index Mundi 2015). No differences in rates of poverty between boys and girls exist in Vietnam. Approximately 43 percent of children in rural areas and 12 percent of children in urban areas are living in poverty (Roelen, Gassmann, and Neubourg 2010). Compared to previous decades, the use of technology is now becoming more popular among Vietnamese adolescent girls, with 94 percent using mass media platforms (UNICEF 2013). This technology allows girls to have access to information and knowledge that they may not have otherwise, which may positively impact their opportunities in life.

Labor

Many children in the country are at risk for forced labor. Children who live on the streets and children with disabilities are at a particularly high risk. Children who are victims of forced labor beg and street hawk; they sell items for adults who control and coerce them. Vietnamese children living on the streets or with disabilities are oftentimes forced to work in factories that make bricks or clothes for low pay. Additionally, it is common for these children to be forced to work in family homes in urban parts of the country. Vietnamese girls are particularly at risk for child sex tourism. Many men travel from the United States, Europe, Australia, and other areas of Asia to sexually exploit young Vietnamese girls (U.S. Department of State 2015).

Within the past two decades in Vietnam, there has been a decrease in child labor, as higher rates of boys and girls are enrolling in school. Yet, girls still perform more unpaid household work than boys of the same family. Girls are more likely to cook, clean, wash clothes, and buy the

family's food than boys. However, as children get older, the gender gap in household work declines, and boys and girls eventually perform a more equal distribution of work around the home (Vu 2014; UNICEF 2008).

Sex Education

A need exists for access to sex education and reproductive services for adolescent girls in Vietnam. Generally, many girls and women in the country lack knowledge regarding sex, contraception, and reproductive health. Sexuality is a sensitive topic in the country and has historically not been discussed among family members or within schools. Adolescent girls in urban areas can access reproductive information on the Internet, but adolescent girls in rural areas oftentimes do not have this access (WHO 2015). The National Strategic Outline for Reproductive Health of 2010 recommended school-based sexual and reproductive health education for all Vietnamese students. However, this education is limited. Only 51 percent of Vietnamese adolescent girls report having a comprehensive knowledge of HIV (UNICEF 2013).

Girls with Disabilities

Girls with physical and mental disabilities in Vietnam are viewed as a disgrace to their families as well as a burden to the country. These girls are more likely to take on lesser-paying manual and domestic jobs, such as child-rearing for their families, knitting, and generating handmade materials. Even though girls with disabilities often take on these jobs, they are still viewed as a group that does not contribute to the labor force. Many girls with disabilities are also looked down upon because they cannot fulfill their traditional roles within the family, such as having children (Nguyen and Mitchell 2014). Experts say that intervention is needed in Vietnam to ensure that girls with disabilities still have the same educational opportunities as all other children (Nguyen et al. 2015).

Child Marriage

Despite the country's work to advance the rights of females, 8 percent of girls between the ages of 10 and 19 are married in Vietnam (UNICEF 2013). Vietnam has a minimum age of marriage set at 18 for girls and 20 for boys; yet, many girls continue to be married before reaching this age. Child marriage is detrimental to many aspects of a child's life, including growth, health, and educational attainment.

The causes of child marriage vary, but poverty and gender inequality both contribute to the issue. Girls are often viewed as a financial burden to their families. As a result, marrying daughters off can be seen as an opportunity for families. In families where child marriage has occurred, women are typically viewed as not having as much status as men. In more traditional Vietnamese families, girls may not be permitted to work and contribute to society outside the home; therefore, child marriage is a way of guaranteeing her a future. Many Vietnamese families believe that the earlier their daughters can be married, the more beneficial it will be for the young women (Scolaro et al. 2015).

Education

During the 1990s, education was a national priority in the country. Over the last two decades, enrollment in all levels of education has increased, especially among girls. By 2009, the disparity between male and female literacy rates had decreased, with 95.8 percent of males and 91.4 percent of females reported as literate. However, there is still a literacy disparity between urban and rural females today (Duggan 2001; GSO 2010a). Overall, males complete an average of 7.9 years of schooling, compared to only 7 years, on average, for females (UNDP 2015).

Education in Vietnam includes early childhood education (preschool and kindergarten); basic education (primary, lower secondary, and upper secondary education); vocational training; and higher education (undergraduate and graduate) (Ministry of Education and Training 2015). Greater gender discrepancies in education exist for women in rural areas and women of ethnic minorities. Vietnamese girls who are members of ethnic minority groups have the lowest school attendance rates of any group in the country. These discrepancies may be due to a variety of reasons. Girls who do not understand or speak the language of instruction in schools may be discouraged from attending. For many girls, the distance they must travel to school is too far. Additionally, gender stereotypes that still exist in the education system may deter girls from attending school (UNICEF 2010).

Early Childhood Education

Early childhood education in Vietnam includes preschool and kindergarten for children between the ages of three months and six years. This education is not required. It is estimated that the country's early childhood education

serves 3 million children a year. The purpose of early childhood education in Vietnam is to prepare the children intellectually, emotionally, and physically for basic education (UNESCO-IBE 2011). The number of Vietnamese children under three years old that attend early childhood education is low, as many families seek child care from grandparents or other child care organizations in their neighborhoods. However, compared to other countries in Southeast Asia, early childhood education enrollment for children over three years old is high in Vietnam (Hamano 2010).

Basic Education

Primary education in the country follows early childhood education and is required for all children. This education lasts 5 years and is generally for students between the ages of 6 and 11. The typical primary education school day lasts a half day and is free for students. However, some parents opt to pay to send their children to school for a full day or to supplement the half day with additional learning opportunities. Vietnam is working to extend primary school for all Vietnamese children to a full day by 2020 (World Bank 2011).

Primary education aims to help students acquire knowledge in reading, speaking, writing, calculating, nature, society and human beings, physical exercise, and hygiene. Out of roughly 7 million Vietnamese children enrolled in primary education, 3.23 million are girls. Of the country's 349,500 primary education teachers, 275,600 are women (UNESCO-IBE 2011). Compared to other countries with a lower income level, children in Vietnam have high skills in literacy and numeracy (Rolleston and Krutikova 2014).

After successfully completing primary education, Vietnamese students may enroll in secondary education. Secondary education is divided into two phases. First, students complete lower secondary education, which is grades 6–9. About 6.15 million students are enrolled in lower secondary education, and approximately 2.66 million are girls. Of the 314,900 lower secondary education teachers during the 2009–2010 school year, 213,300 were women. Once students complete lower secondary education, a student must pass an entrance exam to be accepted into upper secondary education. Upper secondary education consists of grades 10–12. Approximately 3.07 million students are enrolled in upper secondary education, with 1.54 million of those students being girls. Of the 125,200 upper secondary education teachers during the 2009–2010 school year, 82,100 were women (UNESCO-IBE 2011).

Overall, of females ages 25 and older, 59.4 percent have at least some secondary education, compared to 71.2 percent of males ages 25 and older who have at least some secondary education (United Nations Human Development Report 2015). Even though there is still not an equal number of boys and girls receiving secondary education, it can be expected for this gender gap to decrease in the future, as, overall, education pursuit is making positive strides toward becoming more equal for boys and girls within Vietnam.

Vocational Training

Students who successfully complete upper secondary education have the opportunity to enroll in vocational training to receive the skills and preparation needed for certain jobs in the workforce. This training lasts anywhere from one to four years, depending on the area of training. Students with diplomas from either secondary school or vocational training may receive admission into higher education (UNESCO-IBE 2011). Gender disparities exist in the number of men and women who have access to vocational training. It is estimated that only 38 percent of urban females have received vocational training, whereas 51 percent of urban males have received training. Only 10.5 percent of males and 7.8 percent of females have received vocational training in rural areas. However, the country has been working to increase the number of women who have access to vocational training, including creating proportions of men and women to be represented in training and supporting women who have children so that they can receive training (ADB 2014).

Higher Education

Higher education in Vietnam includes associate's degrees, bachelor's degrees, master's degrees, and doctoral degrees. There are 224 institutions of higher education in the country, including both public and private. Approximately 53.8 percent of college students in Vietnam are women. International education is also highly valued in Vietnam. As a result, approximately 20,000 Vietnamese students are abroad earning a degree in higher education (Institute of International Education n.d.).

Health

Vietnam has worked toward attaining universal health care for its people within the last two decades. Up until

1989, the country's health care system was completely publicly funded. As a result, people in Vietnam could go to the doctor for free without paying much, if any, out of pocket. However, public-funded health care also meant that there were limited health services available to the people as a result of minimal funding. Therefore, the country decided to reform the health care system, which now means that people in Vietnam pay part of their health care coverage in addition to health insurance coverage costs. However, there are now more health services and resources available to the Vietnamese public (Thanh et al. 2014). This new health care system includes services such as prevention, remedial care, and rehabilitation to all people in Vietnam at an affordable cost. However, many lower-income people in Vietnam still do not have coverage for health care, as they simply cannot afford it (Tien et al. 2011).

Access to Health Care

Vietnamese citizens face many barriers when attempting to receive health care. Even though Vietnam is one of the most populated countries in the world, the country has a shortage of doctors. For every 10,000 people in the country, there are only 7 doctors (GSO 2010b). Because many of the equipment and supplies in the country's hospitals do not come with directions in Vietnamese, but instead come printed in English, hospital personnel who are not fluent in English may not fully understand how to appropriately use the equipment or supplies.

Furthermore, Vietnamese hospitals may not be considered as comfortable as hospitals in other parts of the world. Hospitals in Vietnam are crowded, with patients often sharing rooms and beds. Additionally, hospital rooms in the country do not typically have air-conditioning. The patient's family is in charge of acquiring any prescribed drugs and then administering these drugs to the patient. Thus, a patient's family is important to his or her recovery or treatment (York 2012, 171). Because a vast majority of the Vietnam population lives in rural remote areas, location barriers exist regarding access to health care. Because of these challenges to receiving health care, Vietnamese women are more likely to seek underqualified doctors and buy drugs from underqualified drug providers (Nguyen et al. 2008a, Tuan et al. 2005 quoted in Malqvist et al. 2013a).

Maternal Health

Vietnam has seen substantial improvement in reducing maternal mortality rates. Between 1990 and 2009, maternal

mortality rates have decreased by 70 percent, from 233 out of 100,000 women to 69 out of 100,000 women (WHO 2015). However, inequalities in maternal health care still exist, especially among the poor, ethnic minorities, and women in rural remote areas of the country (Malqvist et al. 2013b). Women living in poverty are 70 percent less likely to give birth in a health care center than women who are not living in poverty. Additionally, compared to women in ethnic minority groups, Vietnamese women who identify as Kinh (the ethnic majority group) are three times as likely to give birth at a health care center (Sepehri et al. 2008, 1015).

Family planning remains a challenge in Vietnam, especially among unmarried women. A high need exists for contraceptive use among young sexually active women in the country. Even though abortion is legal in Vietnam, many young women still resort to unsafe methods of abortion (WHO 2015). Vietnam has one of the highest abortion rates in the world. This rate may be a result of the country's inadequate contraceptive use or son preference (Ngo et al. 2014). As a result of the patriarchal values in the country and the value placed on males, many parents desire a newborn boy over a newborn girl. With advances in technology, many parents are able to determine the sex of the fetus before giving birth. As a result, many parents opt for sex-selective abortion if the fetus is a girl as a way to be sure that they will only give birth to a boy (Sabharwal and Huong 2006).

There is a need for intervention programs to promote breastfeeding in Vietnam. Breastfeeding within the first hour of birth, as recommended by professionals, is more common in urban Vietnam than rural Vietnam. However, rates of exclusive breastfeeding are higher in rural Vietnam. Yet, breastfeeding rates across the country are low overall. Many Vietnamese women still have misunderstandings regarding the importance of breastfeeding their newborns.

Diseases and Disorders

Vietnam has one of the highest rates of death from liver cancer in the world. This high rate is most often a result of the hepatitis B virus and the hepatitis C virus. It is estimated that 12 percent and 2 percent of the Vietnamese population have hepatitis B and hepatitis C, respectively (Gish et al. 2012). Compared to countries in the Global North, Vietnam has a lower rate of breast cancer (23 per 100,000 women). However, unlike Global North countries

where breast cancer rates have been decreasing, the rate of breast cancer in Vietnam has increased. Breast cancer has become the most diagnosed cancer among women in both developed and less-developed countries, such as Vietnam (Trieu, Mello-Thoms, and Brennan 2015; Ferlay et al. 2015).

Rates of HIV/AIDS in Vietnam continue to increase. An estimated 77,000 women ages 15 and older are living with HIV in the country (UNAIDS 2014). These rates are expected to rise, as men will continue to infect women, including their wives (UNICEF 2010). Because HIV-positive individuals in Vietnam are often assumed to be engaging in premarital sex or drug use, many Vietnamese women are hesitant to reveal that they are HIV-positive. Many HIV-positive women in the country fear the stigma that accompanies the diagnosis of HIV and the stigma of the risky activities associated with HIV-positive individuals, such as drug use or premarital sex (DeMarco and Cao 2015). Both Vietnamese men and women have a lack of knowledge on HIV, which contributes to their misjudging their chances of contracting the disease (UNICEF 2010). Other common diseases in Vietnam are bacterial diarrhea, hepatitis A, typhoid fever, malaria, and Japanese encephalitis (CIA 2015).

Vietnamese adolescents, in particular, experience a high prevalence of mental health problems, such as stress, substance abuse, emotional difficulties, and behavioral problems. Suicidal behaviors are significantly more common among female Vietnamese adolescents than male Vietnamese adolescents. Many mental health problems among adolescents are associated with the pressure to succeed in school from parents and teachers as well as the challenging school curriculum within the country. Even though there is a high prevalence of mental health problems among Vietnamese adolescents, mental health services for this age group are lacking. However, public awareness of mental health problems in the country, such as anxiety, stress, depression, and suicide, has increased from recent years (Nguyen 2013).

Opiate use in Vietnam has become a significant health concern. Having once been prevalent in only rural areas, opiates have spread to urban areas in the country. Recently, Vietnamese women have begun to partake in opiate use at increasing rates. Even though both males and females use opiates, the demand for opiates among young women is especially concerning, as many are of reproductive age. Vietnam has found it difficult to offer opiate interventions and services to women. Many Vietnamese women use

opiates with their boyfriends or husbands, which makes it difficult for these women to stay off the drugs if they are continually exposed to them through their partner. In addition, many female opiate users are sex workers, which makes it difficult for interventions to reach them (Nguyen and Scannapieco 2008; Oosterhoff and Nguyen 2006).

Finally, compared to other countries in Southeast Asia, Vietnam has high rates of premature deaths due to accidents, such as drowning and road injuries (Global Burden of Disease 2015).

Employment

Women make up 48.7 percent of Vietnam's labor force. Yet, a gender pay gap still exists, as women's earnings are only 70–80 percent of men's earnings. The retirement age for women in the country is 55 years old, whereas it is 60 years old for men (United Nations in Viet Nam 2015). The majority of working Vietnamese women work in agriculture (50%). The remaining women work in services (33%), including education, health, restaurants, and hotels, followed by industry (17%), which includes textiles and footwear (GSO 2008).

Vietnamese women face many challenges in the workforce. Women working in industries typically earn low wages, work long hours, and have minimal opportunity for promotion. Women have less opportunity to improve their incomes and job positions because of less education attained, fewer skills and training, and the presence of gender discrimination in the labor market (GSO 2008). Furthermore, many working women in the country are in need of transportation to and from work as well as child care that is close to their work (World Bank 2014). When women seek jobs in male-dominated industries, such as chemical, oil, gas, or information technology, they are often discriminated against (Sabharwal and Huong 2006). Rural women in particular face difficulty even finding work, as their remote location can limit job options. Despite these challenges, women who work outside the home for pay in Vietnam are able to financially contribute to their families, gain self-esteem, and increase their negotiating power, which can narrow the influence that men have over women (Pham 2016).

Additionally, women in rural Vietnam are now doing the majority of farming, as men who used to do farming are moving to non-agricultural-related jobs. Women in rural areas who farm work between 8 and 17 hours a day. The working environment for these women is less than

ideal. Most female farmers only have basic farming tools and work in conditions where they are exposed to toxic chemical use (Thinh 2009).

In 2012, Vietnam extended its maternity leave from four months to six months to ensure the health and well-being of both mothers and newborns. This maternity leave is paid by public funds. Experts suggest that Vietnam's maternity leave law should serve as an example to other countries around the world (UNICEF 2012).

Family Life

The country's revised Marriage and Family Law of 2014 stresses that male and female family members are equal and have equal rights (United Nations in Viet Nam 2015). However, Vietnamese family functioning is still guided by Confucian philosophy, which encourages families to practice patriarchy, where men have more status than women. Vietnamese women are expected to obey their husbands, and sons and daughters are expected to obey their parents. A higher value is also placed on sons within the family compared to daughters (Burr 2014). In most instances where a female is the head of the household in Vietnam, it is because she does not have a spouse (Dommaraju, Premchand, and JooEan 2014).

Following the political and economic reforms that occurred in the 1980s and 1990s, families in Vietnam started to transform. The number of children a Vietnam family chooses to have is decreasing. Today, households in Vietnam have an average of 4.5 people, with the average number of children in the household being 1.5 (Dommaraju, Premchand, and JooEan 2014, 563).

Similar to the rest of Southeast Asia, Vietnam stresses the importance of respect for older family members. When older family members are in need of care, it is usually younger family members who offer that care. In Vietnam, daughters do not have as much responsibility for caring for parents and older family members compared to sons and their wives (Friedman et al. 2002).

Marriage

Families in Vietnam play a large role in supporting and strengthening new marriages. Couples who did not seek input from their families before they married are more likely to divorce compared to couples that allowed their parents to decide on their marriage, or who at least sought their parents' approval for their marriage. Marriages

arranged by parents in the country are decreasing. Women, lower-income Vietnamese, and Vietnamese in rural areas are more likely to have their marriages arranged. However, the most common way of getting married in the country is when the couple makes the decision together with their parents (UNICEF 2008).

The age when Vietnamese adults first get married is rising. Rural women in the country tend to get married at younger ages than women living in cities who are skilled professionals. The majority (97%) of women who are married have only been married once. Of those Vietnamese people who have been married more than once, women are remarried less often than men. People who have received less education typically have more marriages (UNICEF 2008). In Vietnam, approximately 6 percent of married women live with their parents, and almost 10 percent of married women live with their parents-in-law. These arrangements are especially prevalent in rural areas, where traditional family values are more present and newlyweds do not initially move into their own home (Dommaraju, Premchand, and JooEan 2014, 569).

Marriage is highly valued within the country; yet, new contemporary types of families are becoming more popular. Compared to divorce rates in other parts of the world, Vietnam's divorce rates are low. However, divorce rates within the country have increased in recent years. Approximately 1.4 percent of people above the age of 15 are divorced, with more women being divorced than men. Vietnamese women initiate divorce almost twice as often as men, which may be attributed to an increase in women being cognizant of their rights. Vietnamese children of divorced parents live with their mother a majority of the time (64.3%). However, many divorced men with children tend to not make adequate child support payments to the mother, and as a result, both the women and children suffer. Additionally, many women in the country are refraining from marriage. The majority of unmarried women in Vietnam live in rural areas (UNICEF 2008).

Lesbian, Gay, Bisexual, and Transgender Rights

Until recently, little discussion has occurred about lesbian, gay, bisexual, and transgender (LGBT) rights in Vietnam. Vietnam has historically held the view that marriage should be between a man and a woman, as men and women are perceived to hold different gendered responsibilities within the family. Having a son or daughter in Vietnam

that identifies as LGBT has been viewed as shameful for the family (Horton 2014). LGBT people in the country face a great deal of discrimination and stigmatization. Much of this discrimination against LGBT individuals is the result of misconceptions that the public holds, such as LGBT individuals can be cured or being LGBT is merely a social trend (Phillips and Hanoi 2013).

In November 2015, a momentous step was made for transgender individuals in Vietnam. The government legalized sex-reassignment surgery for transgender individuals wishing to have the surgery in Vietnam, instead of having to travel abroad for the procedure. This legalization also allows transgender individuals who have had sex-reassignment surgery to change their gender on official documents (HRW 2015).

Child-Rearing

Mothers and older female relatives of girls are viewed as their role models, regardless of the girls' ages. Mothers do not serve as large of a role-modeling responsibility for boys in the family, compared to fathers. However, women in the home have more of a role in disciplining the children. Women also take on the role of getting the children ready for school and making sure the children are bathed and fed (Rydstrom 2001).

Gender Roles

More women in the country are beginning to work outside the home as a result of greater educational opportunities and attainment. However, women still have a responsibility to perform the work in the home and kitchen (Hays 2008). Women in Vietnam are typically the family members who wake up early to clean the home, cook for the family, and bathe the small children and elderly family members. Many rural Vietnamese women are also in charge of caring for the livestock and working in the fields. Because these duties are time consuming, many women have little time for leisure activities or relaxation (Nguyen and Tuyet 2007). In instances where the work is equally divided among the husband and wife, it is more common for these families to be higher income, more educated, and living in urban Vietnam (UNICEF 2008).

It is common for women to make decisions around the home regarding smaller affairs and smaller amounts of money, whereas men make the decisions on affairs that are viewed as more important and more costly, such as those regarding loans and property (UNICEF 2008).

Politics

Participation in Government

Vietnam has taken encouraging strides to increase the number of women in leadership roles. Compared to the rest of Asia, Vietnamese women hold a high rate of seats in Parliament. For the 2011–2016 Parliament term, women were elected to 24.4 percent of the seats (United Nations in Viet Nam 2015). Nevertheless, only 2 out of 9 departments of the Vietnamese government are run by women, and only 1 out of 22 ministers are women. Vietnamese women still face many barriers to roles in government, such as traditional views toward women's roles and unequal opportunities for development and training. Additionally, women's household responsibilities limit their ability to partake in government roles (ADB 2012).

Laws

Within the last decade, Vietnam has passed laws to protect women and their rights. For example, the Law on Gender Equality was passed in 2006, which aims to ensure gender equality in families, politics, and society in general. The country also approved the National Program on Gender Equality 2011–2015 in 2011 to further support the Law on Gender Equality (ADB 2012).

Feminist Organizations

The Viet Nam Women's Union is a grassroots organization created to build programs for the development of women in areas such as health, credit, and education. The Viet Nam Women's Union has 14 million members (UN Viet Nam 2017). Once women become members of the program, they can receive the organization's offered services. The organization also draws attention to issues impacting girls and women in the country to promote social and economic equality (ADB 2012).

In fact, the Viet Nam Women's Union collaborates with the Viet Nam Country Office to train women on how to respond to natural disasters. The goal of the collaboration is to train women with the skills and knowledge needed to prevent, prepare for, and to reduce the impacts of natural disasters and climate change. This project is a method of getting women involved in an issue of concern to Vietnam by increasing their representation and decision-making abilities (UN Women 2017).

Religious and Cultural Roles

Today, Vietnam is a country that recognizes freedom of religion and, thus, acknowledges many different religions. However, some people believe that the government still does not recognize the benefits that religion can play in Vietnamese people's lives, and, as a result, they fear practicing their religion freely. Many Vietnamese people also believe that their views are considered a threat to the government, as many religious people in the country support views or behaviors that go against the views of the government. Religious groups must register with the Vietnamese government to be legally recognized. And the government must grant permission for many local religious events to occur. As a result, many religious people in Vietnam still do not feel that the country recognizes freedom of religion (Reese and Glendon 2016).

In total, there are approximately 37 different religions recognized within the country, and 24 million people in the country are members of a religious group. About 11 million people in Vietnam practice Buddhism. The majority of Buddhists practice Mahayana Buddhism. The majority of Vietnamese practicing Mahayana Buddhism are Kinh, members of the majority ethnic group. Other Buddhists in the country practice Theravada Buddhism. The majority practicing Theravada Buddhism are of Khmer ethnic minority group. Catholicism is increasing within Vietnam; there are 6.2 million Catholics in the country. Vietnamese who practice Cao Dia, which combines features of many religions, make up 4.4 million people from the population. There are approximately 1.4 million Protestants in the country. Hoa Hoa religious members make up 1.3 million people of the population. Finally, a variety of religions with smaller followings, such as Hinduism, Islam, and Judaism, make up less than 0.1 percent of the population. Of the Vietnamese people who do not classify themselves as part of a particular religion, many still participate in religious events. Furthermore, the country has hosted international conferences for religious leaders (Home Office 2014; U.S. Department of State 2013).

Celebrations

Most people in Vietnam celebrate the Lunar New Year Festival (also referred to as *tet*). Lunar New Year occurs sometime between the end of January and the beginning of February and signifies the change in seasons. During *tet*, a four-day national holiday occurs, but the *tet* festival occurs over two to three weeks. *Tet* includes a variety of different

celebrations, including family rituals, meals, worship, and family reunions (McAllister 2012).

Issues

Sex Trafficking

Vietnam is considered a source country for victims of sex trafficking. Despite laws against human trafficking in the country, girls and women are still being trafficked in and out of Vietnam, mainly for sexual exploitation purposes. Many single men in China and Southeast Asia buy virgin Vietnamese girls to be their brides. Impoverished Vietnamese women are at greater risk of falling victim to deceptive career opportunities. Women will go with a trafficker, thinking they have a job opportunity, but they are instead introduced into the sex industry, both within Vietnam and out of the country (Tucker et al. 2010). Many Vietnamese women are trafficked out of the country to Cambodia, Laos, China, Thailand, and Malaysia. With advances in technology, it has become increasingly popular for men to use online dating sites to lure Vietnamese women abroad. Once the women travel abroad to meet the men, they are forced into sex trafficking (U.S. Department of State 2015).

In 2011, Vietnam passed the Law on Anti-Human Trafficking to address this pressing concern in the country (ADB 2012). Vietnam has increased the number of border officials in areas where trafficking is at greater risk. In addition, more officials have received training to combat trafficking. The country is also working to convict national and international traffickers. Despite efforts by the Vietnamese government to eliminate sex trafficking, it continues to occur. Vietnam passed an antitrafficking action plan for 2016–2020 to further work to eliminate the issue (U.S. Department of State 2015).

Domestic Violence

Even though the Vietnamese government has passed laws to reduce violence against women, such as the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) in 1981 and the 2007 Law on the Prevention and Control of Domestic Violence, domestic violence against women is still a concern within the country. Patriarchal values remain present in Vietnamese society, and they worsen the occurrences of domestic violence (Tucker et al. 2010). Overall, half of Vietnamese women are at risk for being victims of

domestic violence in their lifetimes. Approximately 54 percent of women have experienced emotional abuse, and 34 percent have experienced physical or sexual abuse (Rasanathan and Bhushan 2011; UN Women 2012). Abused women in the country earn an estimated 35 percent less than women who are not abused (Rasanathan and Bhushan 2011).

A majority (87%) of women who have experienced domestic violence do not seek services for fear of discrimination and the lack of services available to victimized women (United Nations in Viet Nam 2014). Even the younger Vietnamese population still justifies domestic violence. Of adolescent girls in Vietnam, 35 percent justify wife beating (UNICEF 2013). Thus, domestic violence is a serious problem in Vietnam that negatively impacts the economy. In 2014, the government approved the National Action Plan on Domestic Violence through 2020 to address domestic violence prevention and response (United Nations in Viet Nam 2014).

Sexual Harassment in the Workplace

A majority of the country's victims of sexual harassment in the workplace are women working in low-paying jobs. Young women between the ages of 18 and 30 are at increased risk for sexual harassment at work. This sexual harassment includes physical touching, unwelcomed flirting, sexual comments, communication through technology, or other unwanted forms of verbal harassment, offers of sexual intercourse, sexual assault, and rape. Many victims of sexual harassment in Vietnam do not report it for fear of losing their jobs (United Nations Viet Nam 2014).

A

Albania

Overview of Country

Albania is located in the southeastern part of Europe, and it shares a northwest border with Montenegro, a northeast border with Kosovo, an eastern border with Macedonia, and a southern and southeastern border with Greece. It borders the Ionian Sea on the southwest and the Adriatic Sea on the west. Albania is divided into 12 administrative prefectures and 61 municipalities, according to the territorial reform introduced in 2015.

Albania became an independent state on November 28, 1912. The period after the independence was followed by political instability and a difficult social and economic situation (Keefe et al. 1971). On November 29, 1944, the country was liberated from the Nazi-Fascist occupation that began April 7, 1939. The Antifascist National Liberation War was led by the Communist Party (founded on November 8, 1941) that came to power after the liberation. The new regime, calling itself a “dictatorship of the proletariat,” was a one-party system. International migration was banned, and the state controlled the internal migration of the population. The mass media were state-controlled, and religion was banned from 1969 until 1991 (Keefe et al. 1971). Countrywide campaigns against illiteracy and the improvement of the educational system made possible an illiteracy rate of less than 8 percent by 1989 (INSTAT

2002), compared to more than 80 percent at the end of World War II (Gjonca, Aasve, and Mencarini 2008).

Despite efforts in the reconstruction of the country and the introduction of social and health care systems, the difficult economic situation deepened after the communist government broke off all relations with the communist bloc. Albania was the poorest country in Europe following the communist regime, with a gross national product (GNP) per capita of about USD\$380 (Gjonca, Aasve, and Mencarini 2008; World Bank 1996). Albania implemented what is called the women emancipation model (Moghadam 1995)—policies that support women in the labor force—and introduced laws that promote women’s equality, but there was little impact on the changing of gender roles.

In 1991, Albania established the multiparty system, marking the official end of the communist period. The goals of the early postcommunist period were the opening of the country to external influences, a new multiparty political system, and a new market economy, characterized by a shock therapy model (the sudden lifting of price and currency controls). After the fall of communism, women withdrew from politics and the labor market. Women’s participation in Parliament dropped from 30 percent to 4 percent in 1991 (Ekonomi et al. 2009).

The Albanian Republic is a parliamentary democracy established under a constitution renewed in 1998. Elections are held every four years to a unicameral 140-seat chamber, the People’s Assembly. Albania joined NATO on

2 Albania

April 1, 2009, becoming the 27th member of the alliance. “Executive power rests with the Council of Ministers (cabinet). The president appoints the prime minister; ministers are nominated by the president by the prime minister’s recommendation and voted by the Assembly” (Kocaqi, Kelly, and Lovett 2015).

The current resident population of Albania, according to the Census of 2011, is 2,800,138 (1,403,059 men and 1,397,079 women). Internal and international migrations have characterized post-1991 Albania. Nearly 1.5 million Albanians, that is, more than half of the resident population, had emigrated between 1990 and 2010 (Vullnetari 2012). The Census of 2011 showed a decrease of the population in Albania by 7.7 percent in about 10 years. According to the National Institute of Statistics (INSTAT), this was a result of fertility decline as well as continuous emigration (INSTAT 2012).

The Human Development Index (HDI) of Albania in 2014 was 0.716, ranking Albania 95th out of 185 countries and among the high development countries (UNDP 2014). The Gender Inequality Index (GII) is 0.245, showing persistent gender inequalities.

The equal rights of women and men are protected under the 1998 Albanian Constitution: Article 18 guarantees women’s equality and nondiscrimination before the law. The country ratified the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) in 1993 and its Optional Protocol in 2003. In 2008, the Parliament approved the Gender Equality Law. The legislation framework on gender equality is complemented with the law On Measures against Violence in Family Relations, adopted in 2007; the law On Protection against Discrimination, adopted in 2010; the Labor Code and Family Code; and the amendments made in the Penal Code regarding violence against women.

Girls and Teens

Despite the signs of the aging population, Albania still has one of the youngest populations in Europe; the number of children under the age of 20 is 847,312, of which 437,501 are male and 409,811 are female. Unfortunately, studies and research about girls and teens are still lacking compared to those on women.

Child Abuse and Neglect

In 2010, Albania approved a new law, On Children’s Rights, which required public agencies across the social service

sector at all levels to report on child abuse and neglect (CAN). The child protection continues to be developed, and the country has neither a CAN system of monitoring nor approved indicators (Hazizaj et al. 2013). The existing studies and survey show that child abuse and neglect is an existing issue in Albania, touching both girls and boys. Among children 11–16 years old, girls are more affected by psychological violence and neglect compared to boys, while no gender differences may be noticed regarding physical violence. According to the National Child Helpline, there are more girls than boys who ask for support from Alo (the Albanian National Child Helpline). They report cases of domestic violence and different treatment than their brothers. Girls also report being overburdened with housework and care for their brothers, thus confirming the predominance of traditional gender roles, ascribing to girls and women the exclusivity of housework and care (Albanian National Child Helpline 2013). Among the cases of physical violence, only 18 percent are reported to legal services. This also happens in the cases that constitute a criminal offense, such as the sexual violence where only 21 percent of the cases are reported to the legal authorities (Hazizaj et al. 2013).

Regarding some main behavioral patterns of teens in Albania (11–15 years old), it may be seen that boys report higher levels of e-communication compared with girls. Smoking prevalence is higher among boys than girls (2.6% versus 0.8%). Only 5.7 percent of the 15-year-old children have used cannabis at least once. The use of cannabis is higher among boys—10.5 percent versus 1.4 percent for girls. When it comes to sexual behavior, 19.5 percent of the children aged 15 years have had sexual intercourse, 95 percent of whom are boys (IPH, UNFPA, and UNICEF 2014).

More than one-third of male adolescents and almost one-quarter of female adolescents justify wife beating (UNICEF 2013). This figure is significant in understanding the issue of violence against women that still has high rates in Albania.

Early Marriage

The minimum legal age for marriage is 18 years old. Almost 10 percent of women between the ages of 20 and 24 married before they were 18. The UNFPA reported that, in 2011, approximately 31 percent of female Roma children between the ages of 13 and 17 were married (U.S. Department of State 2014). Some Albanian girls are subjected to sex trafficking or forced labor following arranged marriages.

Education

The educational system in Albania includes preschool education, which is not compulsory, for ages 3–5; primary school, which is compulsory, for ages 6–10 (grades 1–5); lower secondary, which is compulsory (grades 6–9); upper secondary school, which is not compulsory education (grades 10–12); and tertiary or university level (UN Women, UNFPA and INSTAT 2014). Studies show that there are no significant differences between boys and girls in the primary education level. Differences may be seen in the secondary level, where the number of boys prevails, and in the university level, where the number of girls is greater than that of boys.

The enrollment rates are lower in rural areas and among the poor. Problems remain regarding the access to education of minority groups: the dropout rate of children with disabilities is approximately 10 times higher compared to the general dropout rate, and the school participation rate of Roma girls is significantly lower than that of Roma boys (Wittberger et al. 2012).

Preuniversity Education

Preuniversity public education is free. Recently, there has been an increase in the number of private institutions in all levels of education, which may offer better education but with expensive fees.

An indicator of the situation of girls and boys at the preuniversity level is the Gender Parity Index (GPI). The GPI is 1.0 in the primary level, 0.98 in the lower secondary, and 0.95 in the upper secondary level, showing the prevalence of boys compared to girls. A greater gender gap is noticed in the secondary vocational education, where female students comprise about 31 percent of the students (INSTAT 2015).

University Level

Public and private institutions provide university education. The entrance to the public institutions is based on the Matura State Exam (at the end of the secondary education).

Significant differences may be seen in the university level, where the GPI is 1.23, which shows a prevalence of young women. One of the explanations given for this increasing gap is that young men engage more in paid work or emigration (Ekonomi et al. 2004). In the academic year 2011–2012, female students constitute 55.4 percent of the total students (UN Women 2013).

Literacy Rate

Literacy is high in Albania—almost 100 percent of the total population. There is no significant difference between the youth literacy rates of men and women, at 99 percent. Gender differences exist only among the elderly (UN Women, UNFPA, and INSTAT 2014). This is related to the difficulties women had accessing education before the communist regime.

Health

Access to Health Care

Legally, access to health is equal between women and men. However, reports show that the economic inequality between men and women may influence the access of women in health care. The public health care system in Albania is free (or with reduced fees) for those paying social insurance contributions and other categories (pregnant women, patients with tumor diseases, etc.). In the larger cities, there are private hospitals and clinics. People are often obliged to make informal payments to get the needed care, even in public institutions. This affects more women than men, as women have lower employment, less coverage by the social insurance scheme, and more dependence on income from men.

Reproductive Rights and Abortion

Abortion was banned in Albania before the 1990s. During socialism, abortions were performed in secret and in inappropriate conditions. In 1995, abortion was legalized. A law passed that clearly stipulated that the termination of pregnancy shall not be considered as a method of family planning and that up to the 12th week of pregnancy women shall have the freedom and opportunity to decide to terminate the pregnancy. However, abortion remains a method of family planning for many women. Despite almost 99 percent of married women having heard of at least one modern method of contraception (INSTAT, IPH, and ICF Macro 2010), only 33 percent of them have ever used a modern contraceptive method.

According to Albanian Ministry of Health statistics, in 2009, the abortion rate was 270 per 1,000 live births, and in 2012, it was 224 per 1,000 live births. Nevertheless, data about abortion should be taken cautiously because many abortions are performed clandestinely and not reported.

Gender-Selective Abortion

Although there are no accurate data, gender-selective abortion is present in the post-1991 Albania (UNFPA and World Vision 2012). This may be explained by a traditional preference for sons. A recent survey shows that young males wish to have two sons. The same is also seen among the young people from the north areas of Albania, where there is a preference for male children (Cela, Kamberi, and Pici 2015). The law prohibits gender-selective abortion, but reports show that abortions may be performed clandestinely.

Maternal and Infant Mortality Rate

Maternal and infant mortality rate in Albania have been constantly decreasing during socialism and postsocialism. In 2010, the maternal mortality rate was 27 deaths per 100,000 live births (UNICEF 2015). Of all pregnant women, 97 percent receive antenatal care at least once during their pregnancy, with slightly lower rates among women aged 35–49, women in the mountain areas, and women in the lowest wealth quintile (Wittberger et al. 2012). The infant mortality rate in 2012 was 15 per 1,000 births, with no significant differences between female and male infants, and the under-5 mortality rate is 17 per 1,000 live births (UNICEF 2015).

Employment

The Labor Code of the Republic of Albania is based on the main constitutional provisions and ratified international documents. Men and women can choose their professions freely (Plaku et al. 2012).

Labor Force Participation, Employment, and Unemployment

Almost half of Albanian women are out of the labor market, compared to one-quarter of men. The economic inactivity of women is mainly related to the engagement in domestic tasks. National statistics show that, in 2014, only 0.3 percent of men are inactive because of “fulfilling domestic tasks,” compared to 21.6 percent of women (INSTAT 2015).

The male employment rate is 58 percent, and female employment rate is 43.3 percent. Among the “self-employed” and “employees,” it is men that dominate. Meanwhile, females are 1.3 times more likely than males to be “contributing family workers” (i.e., unpaid and classified

by the International Labour Organization (ILO) as “informal employment”). In 2014, the unemployment rate for 15- to 64-year-olds was 17.9 percent. The unemployment rate for this age group is higher for men.

Women are more concentrated in sectors such as health and education and less in service, retail, and trade. In the sectors of construction, transportation, and telecommunications, their participation is very low. Furthermore, there is also a visible vertical occupational segregation because data shows that in the levels of lawmakers and senior and executive positions, women make only 14.6 percent of the total employees (Council of Ministers 2014).

Unpaid Care

Women are almost exclusively in charge of the unpaid care work. According to the “Time Use Survey” (INSTAT 2011), the share of the work of women and men within the house continues to be unequal in a very significant way. The total amount of time women spend on work—paid and unpaid—is higher than that of men by two hours a day, seven hours versus five hours, respectively. Men are also more advantaged in comparison to women regarding free time and personal care. Women with small children have less free time and the largest amount of time dedicated to unpaid work compared to men as well as compared to other women with older children or no children. The less time spent in unpaid work and more time spent in free time is noticed with women who have no partner and no children, while women in employment have the longest working day (i.e., total work), the shortest free time, and the shortest time for personal activities.

Entrepreneurship

Regarding women owners and administrators of businesses, the percentage in 2014 has increased to 28.5 percent (INSTAT 2015). However, this positive increase is to be considered with caution because a majority of these businesses are small (one to four employees), and it is often the husband who runs the business.

Gender Pay Gap

According to INSTAT (2015), in 2014, the gender pay gap was 10 percent. However, gender pay gap varies, depending on the type of enterprise ownership. Women are concentrated in low-level positions, in public and private

enterprises, which results in lower-paid positions. The vertical occupational segregation combined with the horizontal (women concentrated in agriculture, health, and education sectors) further affects the gap of payment between men and women.

Family Life

Marriage

The marriage rate is still very stable, and marriage remains the exclusive form of family formation. Cohabitation is recognized in the new Family Code but remains a marginal practice. Marriage rates have remained stable since 1990 (INSTAT 2015). However, there has been a significant increase in the rate of divorce for the same period. Marriage patterns vary according to the region as well as the educational level of women, with women in the urban areas and higher education marrying later than the others.

The increase of average age for marrying for men is a little older than for women, from age 27.3 in 1990 to 29.5 in 2014, while the average marrying age for women changed from 23 in 1990 to 24 in 2014.

The Albanian Family Code does not recognize same-sex marriage. The issue has been discussed, but it has been reduced to a political debate rather than a substantial public debate.

Family size in Albania has been constantly decreasing; the average was 3.9 members in 2011 (INSTAT 2012). The main reasons for this decrease may be the decrease of the fertility rate as well as the internal and international migration processes.

Fertility

The fertility rate in Albania has decreased significantly, from 3.2 in 1989 to 1.78 in 2014 (INSTAT 2002; INSTAT 2015). Fertility decline is important in all age groups and both rural and urban. In urban areas, the proportion of childless women is higher compared to rural areas; however, the proportion is high, even in rural areas, and it has been increasing. In 2011, the number of childless women aged 25–29 was more than triple that of 1989. The growing number of women who attend college may also have an effect on the fertility rate, as women with higher education tend to have fewer children and postpone the birth of their first child (Danaj et al. 2005).

Politics

Legislation

The number of women participating in politics was at its highest during socialism. In the immediate legislature after the fall of socialism, the number of women in Parliament and government sharply declined. It was only after the introduction of the gender quotas in the Electoral Code of 2008 that the number of women in Parliament started to increase in a significant manner. The Electoral Code stipulates that both genders must be represented in the list of candidates for military police by at least 30 percent. “Both genders had to be represented in the first three names appearing in these multiname lists. Whereas for local elections, one in any three consecutive names on the list must belong to the least represented gender” (UN Women 2013).

Other amendments in April 2015 reflected the new territorial administrative division and addressed a long-standing recommendation to promote female candidates by increasing the gender quota on candidate lists to 50 percent (OSCE/ODIHR EOM 2015; Council of Ministers 2014).

Women in Politics

The percentage of women in Parliament increased to 21 percent in 2014 (INSTAT 2015). Independent of the introduction of the gender quotas, women have often been placed at the end of the candidate lists. The law was not respected in both general elections following the new Electoral Code. In the general election of 2013, the Central Electoral Commission penalized the general parties. Another incident during the general elections of 2013 was the withdrawal of female candidates. The law stipulates that in the case of withdrawing any elected military police, the vacancy should be filled by the less-represented gender, in this case women. What happened was that women withdrew from the candidate lists to let men fill the vacancies and become members of Parliament.

In the government created after the general elections of 2013, the number of women ministers increased significantly, and in 2014, there were 7 women ministers out of 19 (UN Women 2013). When it comes to local elections, the situation recently improved due to the new amendments (abovementioned) brought to the Electoral Code. After the local government elections of 2015, there is an increase in the number of women members of municipal councils and the number of women mayors, and there are

8 female mayors out of 61, according to the Central Electoral Commission (CEC) data.

Religious and Cultural Roles

Albania is by law a secular country, and according to the constitution, there is no official religion. All religions are equal. Albania is considered a country with religious harmony. During socialism, religion was completely banned, and many mixed marriages happened between people of various religions. According to the last census (2011), Sunni Muslims constitute nearly 57 percent of the population, Roman Catholics 10 percent, Orthodox Christians nearly 7 percent, and Bektashi 2 percent. Atheists make up about 2 percent. However, these figures should be considered cautiously because nearly one-fifth of the population declined to answer the question about religion.

There are no reports of societal abuses or discrimination based on religious affiliation, belief, or practice. However, the veil is often used as a parallel to patriarchy or to a subordination of women, even by politicians. There have been few public cases of discrimination of Muslim women because of their veil, which prevents them from enrolling at universities. Nevertheless, the public debate over these cases has been scarce and superficial.

Issues

Violence against Women

Albania ratified the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) in 1993 and its Optional Protocol in 2003. The first Law on Domestic Violence was approved in December 2006 as a proposal sent to the assembly as an initiative of the civil society, supported by 20,000 signatures of community members; that is one of the most important actions of the Albanian civil society. Moreover, the government of Albania signed the Convention of the Council of Europe for Preventing and Fighting Violence against Women and Domestic Violence (Istanbul Convention) in 2011 and ratified it in 2013 (Kocaqi, Kelly, and Lovett 2015).

Various studies show that the figures of domestic violence are significant. According to the last national study on domestic violence, 60 percent of women have experienced domestic violence (INSTAT 2015). Women aged 18–24 were slightly more likely to experience domestic violence, while women with a university or postuniversity

education were the least likely to experience domestic violence of any type. Women who do not work outside of the home are significantly more likely to experience domestic violence compared to women who work outside of the home; that may indicate a link between women's economic dependence and exposure to violence. Women on maternity leave (3 out of 4) are the group most likely to experience domestic violence. Women in rural areas are also generally more likely to experience domestic violence of all types. Husband and partners do not exclusively inflict domestic violence against women; other family members (parents/stepparents, siblings, in-laws, or other relatives) also commit acts of violence against girls and women (INSTAT 2015; Kocaqi, Kelly, and Lovett 2015). According to the survey of 2013 (Harr 2013), only 8.4 percent of women having experienced domestic violence have asked for any help, and a very small percentage of them have asked for help from the appropriate institutions; the majority have relied on their families.

LGBT Rights

The first important piece of legislation toward the protection of LGBT rights is the law On Protection against Discrimination, which was approved in 2010. It prohibits discrimination in the political, economic, and social spheres on the grounds of race, ethnicity, disability, religion, sex, gender, gender identity, or sexual orientation. The other important step is the approval of the resolution On Protection of Rights and Freedoms of Persons Belonging to the LGBT Community in Albania in May 2015. This resolution recommends a reform of the legislation to reflect protection of LGBT rights, recommends the respective ministries regarding the training of teachers on LGBT rights, and encourages the ombudsman to monitor LGBT rights violation (Dittrich 2015).

During recent years, the debate over LGBT rights has been more visible within the Albanian society, mainly due to the work of several civil society organizations supported by foreign embassies and organizations. There was an attempt to introduce same-sex marriage in the Family Code in 2008. However, the debate turned out to be more of a political trick than a healthy social debate. The European Social Survey conducted in Albania in 2012 found that Albania was among the most homophobic countries in Europe. This is also confirmed by the 2015 study of young people in Albania, which shows the same result as in the first study conducted in 2011, that the main and

strongest prejudice among Albanian young people is homophobia. According to the same study, young men are more homophobic than females. Furthermore, homophobic declarations in the media have been done by well-known politicians (men and women) and artists (men and women). These declarations have been denounced and answered by LGBT rights activists inside and out of Albania.

Armenia

Overview of Country

Throughout its long history, Armenia has been a contested territory. It has been ruled by Alexander the Great, the Romans, the Sassanid Persians, Byzantine, the Ottomans, and finally the Russians, among others. Mentioned first in a Hittite document in the 14th century BCE, Armenia was the first Christian nation in 301 CE. The Armenians have often been the targets of anti-Christian violence. In the 13th century, northeastern Armenia was ruled by the Seljuk, Mongol, and Turkmen, while southern Armenia was Cilician with something like a treaty between itself and the Mongols (Osipian 2014, 82). Massacres of Armenians have tragically been a common thread throughout their long history.

In more recent history, according to *Statesman's Yearbook*, as many perhaps as 300,000 died between 1894 and 1896 in the Great Massacre enacted by Abdul Hamid II (2016). Still in the news and very actively disputed is the contentious Ottoman genocide of 1915, when between 600,000 and 1.5 million were killed (118). The *Statesman's Yearbook* also outlines the political history of Armenia in the 20th century. In 1922, Armenia became part of the USSR, followed by a declaration of independence in 1991, followed by contested elections in 1995 and 1996, and the assassination of the premier, Vazgen Sargsyan, whose brother was president in 2016 (118).

The Republic of Armenia is landlocked, and it borders Turkey, Iran, Azerbaijan, and Georgia in the western South Caucasus. The country is roughly 11,484 square miles (29,743 sq. km). There is a fertile river valley, the Arax, a large part of which is "virtually uninhabitable" (Walker 1991, 7). As of January 1, 2012, the population of Armenia was about 2,969,100 (UNICEF 2012). In 2016, Armenia and Azerbaijan were at war, as both countries claimed the territory of Nagorno-Karabakh.

The poverty rate is high, at 35 percent, and the unemployment rate is high as well at almost 17 percent. Armenia relies on remittances from the diaspora, another constant in its long history, perhaps as much as 23 percent of all households rely on money from friends and relatives working abroad (Grigorian and Melkonyan 2011, 141). From the fourth century CE, Armenians have been on the move, and their language has multiple words for *diaspora* (*tz'rvyalk*, *tz'ronk*, *gaghout*, and *spyurk* or *spr*). Over the centuries, there have been significant populations of Armenians in Byzantine Crimea, medieval Poland, and British India (Tololyan 2005, 37–39). Approximations of the Armenian diaspora populations today include those who live in Russia (2.25 million), in the United States (1.5 million), and in France (about 450,000). The refugee crisis in Syria in 2016 has meant a return from a large Syrian diaspora to an Armenia where work and housing are in short supply (Crowder 2014).

In 2014, the UN Development Programme (UNDP) ranked Armenia 85th out of 187 nations based on the Gender Inequality Index (GII; 0.318). Some of the predominant concerns for women include factors coming out of migration, child sexual abuse, a broken health care system that results in most Armenians using self-care instead of medical care, high incidence of breast cancer and tuberculosis (TB), widespread domestic violence, and low rates of women in leadership positions as well as pervasive human rights violations experienced by lesbian, gay, bisexual, and transgender (LGBT) individuals.

Girls and Teens

The theme of diaspora marks the lives of the teenagers in Armenia. "Apathy prevailing among high school students, high unemployment rates among youth, and lack of prospects for self-realization and self-sustainability force many boys and girls of our age to look for opportunities outside Armenia," said one teen participant in a forum sponsored by UNICEF (2011). Among young women, 98 percent finish secondary school, and 57 percent go to college (World Bank 2013a). Armenian girls and young women are competitive and confident in math, language, and athletic endeavors (Khachatryan et al. 2015, 319). While young women are able to choose their partners, arranged marriages still exist (World Trade Press 2010). Health and sex education are largely nonexistent (UNICEF n.d.). One study showed that between 20 percent and 40 percent of women in Armenia lack sexual autonomy, meaning they

are not allowed to refrain from sex or insist on condoms (Klugman, Hanmer, and Twigg 2014, 14).

Teen Sex Trafficking

Armenia fights sex trafficking through public awareness campaigns and mandatory training for peace officers, labor inspectors, and social workers and awareness training for various nongovernmental organizations (NGOs), educators, media, and students. They provide hotlines, including targeting migration-related calls for trafficking; this number was advertised on their daily television program. Armenian women and children are vulnerable to forced begging domestically. Some children work in agriculture, construction, and service provision within the country, where they are also vulnerable to labor trafficking (U.S. Department of State 2014).

Child Abuse

Young women are sexually abused, sometimes by a parent, and the adult often goes unpunished. A 150 percent increase

in the number of criminal investigations involving sexual violence against minors—including young children—in the early 2000s means that there is more awareness, but in Armenia, more than half the cases of sexual assault in the country involve minors who are often afraid to report violence because they do not trust that the adults will be punished (Kharatyan 2015). The UN independent human rights expert on the sale of children, child prostitution, and child pornography has made recommendations to the government to safeguard the children. Those recommendations are aimed at working on the prevention of violence against children as well as irregularities in adoption processes, which can amount to the sale of children.

Education

Most women complete primary school and go on to secondary education (99%), although the completion rate varies by income, with more than 90 percent of high-income women completing, but only 80 percent and 31 percent completing from middle and lower income groups,

Women's Voices

Khadija Ismayilova

Khadija Ismayilova is an award-winning Azerbaijani investigative journalist who worked as the host of the Azerbaijani service Radio Free Europe, calling attention to the corrupt government through the Organized Crime and Corruption Reporting Project (OCCRP 2015). Her followers created the Khadija Project in her honor—a program that fights for the release of journalists imprisoned for reporting about corruption (OCCRP 2015). Ismayilova's investigative reporting on corruption, including the reports on the presidential family, led to her being recognized with the Courage of Journalism Award by the International Women's Media Foundation, among many others.

Ismayilova was jailed in 2014 on charges many believe were meant to silence her. She stated from prison, "I might be in prison, but the work will continue. I won't break under a 15- or even a 25-year sentence. I am going to have an opportunity to expose [abuses in] the penitentiary services. I am one of those people who knows how to turn a problem into an opportunity" (Recknagel 2015). She was released on May 25, 2016.

respectively (UNICEF 2010, 3). Forty-six percent of college-age people are enrolled in tertiary education. Colleges and universities show a majority of women in a number of fields in the humanities and sciences. However, men with doctorates outnumber women in all academic disciplines, and women are more likely to be lecturers or assistant professors. As authority and responsibility increase, the number of women decreases, including on governing boards and scientific councils as well as in governmental positions in general (Khachatryan 2015).

Health

According to the World Health Organization (WHO), women's life expectancy is 75 years. Twenty-nine mothers out of 100,000 can expect to die in childbirth. A study done in 2012 reported that in terms of self-rated health, about 40 percent of both women and men considered their health excellent, very good, or good, while about 62 percent of women and 60 percent of men considered their health fair or poor. About one-third of all Armenians reported severe health problems (33.4% for women and 29.2% for men) (Demirchyan, Petrosyan, and Thompson 2012). The leading causes of death are heart disease, stroke, lung cancers, chronic obstructive pulmonary disease, and diabetes (WHO 2015a). Data from WHO in 2007 indicate that 55 percent use contraceptives, 100 percent of births are attended by health care workers, and 93 percent have four or more antenatal visits (WHO 2015b, 2).

Water, on the other hand, is problematic: "Out of twenty-two wastewater treatment plants in the country, only four are currently operating and are providing only primary, mechanical treatment; 560 rural settlements are not covered by water operators; and the situation with drinking water and sanitation in schools needs particular attention" (Targeted News Service 2013). Indoor air is polluted with nicotine, as even in hospitals, the nonsmoking policies are flouted. Armenia has one of the highest male smoking rates in the European region (55.1% male and 3.7% female), and many health issues for women result from secondhand smoke (Movsisyan et al. 2014, 943). Fallout from an earthquake in 1988 still reverberates in the health of Armenians. Between 500,000 and 700,000 became homeless, and deaths were estimated at more than 25,000. A study showed that, decades later, survivors still had higher rates of depression and that the long-term impact of earthquake-related material loss was still relevant to quality of life (Khachadourian et al. 2015, 7).

Access to Health Care

Armenians do not use the health care system because it is not affordable.

In fact, 42.8 percent of sick people who were eligible for state guaranteed free-of-charge health care services didn't, because state funding was far less than the real cost of treatments. Moreover, many patients who were eligible for free outpatient drugs were forced to purchase medications in the market versus state funded pharmacies due to lack of supply. Lastly, self-care was found to be 36.2 percent and of these people, 95.3 percent did not visit a doctor due to financial constraints. (Tonoyan and Muradyan 2012, 4)

These authors reported that the Armenians surveyed "prefer the ostrich method," because of the distress of knowing about a condition and being unable to afford the treatment (Tonoyan and Muradyan 2012, 8).

For every 100,000 Armenians in 2011, there were 285 physicians, 72 specialists, 55 surgeons, 25 obstetricians/gynecologists, 26 pediatricians, 51 general practitioners, 42 dentists, 4 pharmacists, and 492 nurses (WHO 2013).

Maternal Health

The maternal death rate is 30 deaths per 100,000 live births (CIA 2015). Most women have more than four antenatal visits and have an attendant at birth.

Major factors perceived as obstacles for adequate nutrition of children and pregnant women included financial difficulties experienced by the population, lack of knowledge and lack of motivation among healthcare providers to provide adequate nutrition counseling and growth monitoring, lack of uniform guidelines concerning nutritional requirements, feeding, and prevention/treatment of micronutrient deficiencies during pregnancy and early childhood, lack of adequate support for initiating breastfeeding in maternity hospitals and overcoming breastfeeding problems thereafter, commercial pressure from pharmaceutical companies influencing providers' decisions and actions, negative social pressure experienced by mothers from older generation, and lack of Armenian-language public education materials in primary health care settings on correct nutrition of pregnant women and children. (Demirchyan et al. 2015, viii)

Rates of small-for-gestational age and preterm births, closely related to maternal nutritional status, were highest in Armenia, compared to other post-Soviet and Baltic countries (9).

Diseases and Disorders

“Breast cancer, the most common invasive cancer among women, has high incidence and mortality rates among women in the Republic of Armenia. According to the World Health Organization, the age-standardized death rate due to breast cancer in Armenia is 38.6 per 100,000, making it the fourth highest nation globally for breast cancer death” (Wright, Simonsen, and Cheng 2014, 230). Only three-quarters of the women surveyed understood that lumps might be an early sign of breast cancer. TB is another health risk. It is a serious public health problem in Armenia, with the estimated prevalence in 2013 being 66 cases per 100,000 population, and with 10 percent being resistant to drug treatment. The situation is complicated by other financial needs leading to treatment interruptions.

Employment

Although women, on average, have a higher level of education than men, their labor force participation rate is lower. This is partly a consequence their responsibilities for children and home: about 55 percent of women 15–75 years old are part of the economically active population, compared with 71 percent of men. Of the women who are not employed or formally defined as unemployed, about 42 percent are housewives, and 22 percent are retirees (ADB 2015, 25). Many women have informal work (which accounts for more than half of Armenia’s economy), and, consequently, they have no access to support systems, such as maternal leave. Women also represent a larger share of the registered unemployed and tend to spend more time searching for work. Many women work in the public sector and make the lowest wages, although wage disparities are closing in wholesale and retail. Women are not, as with education, in managerial roles, of which 77 percent are filled by men. Women earn only 64 percent of men’s income, giving Armenia one of the most significant gender pay gaps in Eastern Europe and Central Asia (ADB 2015, xiv). There has been an increase in women with bank accounts—doubling from 15 percent in 2011 to 34 percent in 2012 (ADB 2015, 25).

Family Life

The *Gender Barometer Survey*, taken in the fall of 2014, shows a traditional culture. Men believe that nature made them stronger and more intelligent and that women should be subordinate (37% men and 26% women) (17). Their beliefs have “deep religious foundations” (17). The survey reported that members of large families feel happier. Married people are happier than those who are divorced, people with more money and education feel happier, and respondents who feel there is sex equity are happier (14). More than half of those studied felt it was very important for Armenian men to have an active social life with many friends, but only 27 percent thought the same for women. Women are expected to be virgins when they marry and to prioritize family and raising children (19).

Politics

The World Bank’s *Gender at a Glance* reports that Armenia’s Constitution guarantees equality for men and women before the law, including property and inheritance. There are no legal prohibitions about women’s work. A woman can take 140 calendar days of maternity leave with her full wages paid. Parents can take an additional 1,025 days of unpaid parental leave. Pregnant and new mothers are protected from workplace discrimination. Both sexes can retire and receive full benefits at 63. There is no legislation that specifically addresses domestic violence (World Bank n.d.). The Asian Development Bank’s (ADB) report *Armenia: Country Gender Assessment* indicates that women represent only 10 percent of parliamentarians and about the same level of high-ranking government staff. Women are also underrepresented in regional and municipal administrative bodies, but their numbers have increased locally, although that may be due to the out-migration of males (xiii). There are only 22 female mayors in Armenia, all in small communities, and “women generally occupy administrative, not decision-making, posts” (17).

One UN development project is aimed at encouraging more women to get involved. It began with the understanding that narrow gender identities, a fear of failure and reputation loss, lack of skills, prohibitive costs, perceptions of the role of community councils, and the lack of a support network were some of the many issues preventing women from becoming leaders in Armenia. It focuses on supporting ordinary women with already ongoing initiatives by training, mentoring, crowdfunding, and conducting activism lessons, as well as teaching tips on political communications (Harutyunyan 2014).

Religious and Cultural Roles

The 2005 Constitution includes the following: “The Republic of Armenia recognizes the exclusive historical mission of the Armenian Apostolic Holy Church as a national church, in the spiritual life, development of the national culture and preservation of the national identity of the people of Armenia as well as a statement about the freedom of those of other adherents to worship as they will” (Wholley 2009, 262). Armenia’s tragic history of genocide means that more than “90 percent of Armenian clergy were eliminated, and the church has never fully recovered” (Avakian 2009). Attitudes cross genders, although they may play a part in the traditional mind-set, in that the church is valued. Being a good Christian is equally important for both men and women (Center for Gender and Leadership Studies 2015, 17). Eighty-seven percent of the population belongs to the Armenian Apostolic Church, and the minority is Armenian Catholic. Two-thirds of the 9 million Armenian Apostolic Church live outside of Armenia (“Armenia” 2016, 121), which has been a potent force in helping Armenians retain their culture and ethnic identity (Wholley 2009, 263–264).

The Armenian Church service has “a highly developed sense of formality, with the emphasis being on the reverent celebration of that act and not solely on the charisma of individual ministers or preachers” (268). The church has strengthened the ethnic and religious identity of the people, which was “constantly under threat, largely from Islam, but also from the Greek and Roman traditions. From such a point of view, the offerings being made to fellow Armenians by some of these ‘newcomers,’ whether Christian or not, must seem paltry indeed, but obviously not so to those who are so attracted” (268). Women are not allowed to be ordained, though there are strong opinions about the need to harvest women’s talents for the church.

Issues

Domestic Violence

Domestic violence is widespread and normative in Armenia. It is addressed by women’s organizations, as they provide services for victims as well as advocate for an improved state response. According to a nationwide survey, 61 percent of women have been exposed to some form of controlling behavior by an intimate partner, and 10 percent have experienced physical violence. The same survey also found that 7 percent of women report giving up a job at their partner’s insistence, and 9 percent report that their partners have

taken their savings against their will” (ADB 2014, 1). A UN Human Rights Study (UNHRS) by Sanan Shirinian points to cultural norms—both men and women think of it as a private matter and that women are to blame when their behavior “causes” the violence; abusive mothers-in-law; a culture of corruption resulting in police and judges who take money to turn the other way; and even doctors think of it as a family matter. “Violence takes the form of brute physical force, beatings, sexual torture (including being forced to engage in sexual activity against one’s will), authoritarian control (imprisoning the victim in the home, controlling contacts with others including family members, controlling all finances including access to food and clothing) and psychological abuse” (Shirinian 2010). A domestic violence report (The Advocates for Human Rights) from 2015 pointed to many recent studies showing that about 60 percent of its respondents had experienced domestic violence. Another study found that domestic violence accounted “for the greatest share of physical and psychological” violence suffered by women in Armenia: 9 percent admitted to experiencing physical violence, 25 percent to psychological intimidation, 60 percent to controlling behavior, and 3 percent to sexual violence, all at the hands of their domestic partners (United Nations Population Fund 2010, 10).

LGBT Persons

A report that was issued by Public Information and Need of Knowledge (PINK Armenia 2012) and others in 2012 details the discrimination against LGBT persons, despite the fact that Armenia agreed to be party a to the International Covenant on Civil and Political Rights on June 23, 1993. The government never mentions its treatment of the LGBT community. The same traditional attitudes that make family violence so pervasive make the situation for LGBT people impossible. Homophobia is rife, and the situation is made worse in that all men must serve in the military for two years. Gay men in the military are subjected to threatening and degrading homophobic treatment. Hate speech is common. Armenian society is very traditional and deeply religious. Almost all Armenians belong to the Armenian Apostolic Church, which condemns homosexuality as immoral and forbids gays from taking communion. When there is a homogeneity of people, faith, and beliefs, standing up as gay is difficult (PINK Armenia 2012, 28).

In December 2014, activists raised the rainbow flag during a state visit by President Vladimir Putin of Russia, whose virulent homophobia was in the news in the run-up to the Sochi Olympics.

The rainbow flag infuriated a faction of the crowd, who attacked the activists. Still, the group kept their flag flying. Sexual minorities in Armenia have watched their community go from taboo to a national debate played out on social networks and in public discussions in recent years. . . . “Society is misinformed, intimidated, and that begets violence and aggression towards the LGBT (lesbian, gay, bisexual & transgender) community,” said Mamikon Hovsepyan, head of PINK Armenia, . . . which found in a recent study that over 70 percent of respondents identified themselves as homophobic. (Hakobyan 2014, 28)

The PINK study details many comments made by Armenian officials, including Emma Khudabashain, a former member of the Armenian Parliament, who once encouraged people to “throw stones” at homosexuals (PINK Armenia 2012, 9).

Feminist Organizations and Grassroots Movements

From 2007 to 2010, the number of registered women’s organizations increased from 76 to 250, representing 6.5 percent of all registered NGOs. Further study is needed, however, to determine more clearly whether all of these organizations are active and whether they engage in advocacy around women’s rights or, rather, are providing services where government services are inadequate or nonexistent. Seventy-six NGOs tend to identify themselves as working on “women’s issues,” rather than on gender equality more broadly. A very small number of organizations work specifically with men on topics related to gender stereotypes, masculinity, or gender identity (ADB 2015, 21). One study by the International Foundation for Electoral Systems (IFES) found nine Armenian societies working on women’s issues. The organizers ranked themselves most strongly on providing services, counseling, and training, but not as highly for advocacy or data collection. Organizations feel that the government should prioritize adopting domestic and sexual violence law, adopt a quota system for women representatives in government, financially support shelters, and make laws against demeaning depictions of women on television (IFES 2013, 7).

Austria

Overview of Country

The Republic of Austria is a landlocked federal state in Central Europe. In its current form, Austria has existed since 1955. Until 1918, the territory was part of the Austrian-Hungarian Empire, a hereditary monarchy. The 1920 Federal Constitution then instated the First Republic and provided the basis for the Second Republic after World War II, in 1945. In the form of a corporate democracy, the constitution enshrines the interests of certain groups, such as the Catholic Church. Due to ambiguity about this state form of "corporate democracy," Austria is also often referred to as a *de facto* semipresidential or a proportional-representative parliamentary democracy. Elected by direct popular vote every five years, the federal president is the official head of state and appoints, by approval, the federal chancellor who heads the federal government.

In 2013, the nine federal states had a combined population of 8.5 million. The official language is German. Eighty-eight percent of the population speaks one of the so-called Bavarian-Austrian dialects as a first language. Other partially recognized languages are Croat, Hungarian, and Slovenian. Bosnian, Serbian, and Turkish are the largest minority languages (CIA 2017).

In 2009, 40 percent of people living but not born in Austria were from other European Union (EU) or European Economic Area (EEA) states, and 47 percent were from other European states, notably Bosnia, Croatia, Serbia, and Turkey. Thus, only 13 percent were from continents other than Europe (CIA 2017).

In 2014, the Roman Catholic Church in Austria had 5.31 million members (62% of the Austrian population). In 2009, about 3.7 percent of Austrians were Protestant, and 6.2 percent were Muslim. Around 12 percent were not members of any religious community. While there are only around 8,000 Jews, there are about 10,000 Buddhists and a growing number of Jehovah's Witnesses (around 20,000).

In 2016, Austria's nominal gross domestic product (GDP) was \$48,957 per capita (IMF 2017), and its Human Development Index (HDI) was 0.891 (UNDP 2016b). The Gini coefficient was 0.274 in 2015 (OECD 2017b). The overall unemployment rate was 5.1 percent in September 2014 (the EU average is 10.1%) (UNDP 2016a).

Girls and Teens

In the Second Republic, much of the organization of public life has taken place in a context of struggle for political influence between the Austrian Social-Democratic Party (SPO) and the conservative Austrian People's Party (ÖVP). This means that, for most services, there exists a dual structure: two home care providers, two motorist assistance services, and so on. Although voting behavior broke up this duality in the early 2000s, there remains a continuing influence on people's, and women's, concrete possibilities to organize their lives. This happens in a context of highly differential political-legal frameworks of each of Austria's nine federal states. In addition to regional and socioeconomic aspects, these significantly structure how women manage their lives based on their access to public services.

On the federal level, there are, however, many statutes in place. Austria signed the UN Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) in 1980 and ratified it in 1982. Many women-specific issues, however, are in the hands of quasi-nongovernmental organizations, societies, or associations. Many of them fulfill a "public service" and have a certain degree of freedom to set their agendas while being funded (mostly) publicly. This is a balancing act due to all the actors and interests involved.

As a culturally Roman Catholic country, the establishment of the Ministry for Women in 1990–1991 headed by social democrat Johanna Dohnal was a milestone for the public discussion of women's issues in Austria. While the ministry contributed to formalize and institutionalize women-specific—and increasingly gender-sensitive—policy making, the early 2000s have also shown the continued struggle and instability of legal achievements. For example, the termination of a pregnancy within the first three months was decriminalized in 1975, but only as a "temporary solution." It can, therefore, be revoked at any time by a majority in Parliament.

This is the outcome of compromise-based policy making between social-democratic welfare statism and more religiously conservative groups. This process of negotiation between different interests often manifests in compromises characterized by veiled contradictions. For example, the

call for a legal recognition of same-sex couples in a socially accepted form comparable to a civil marriage has, after a court case in 2003, resulted in the formal introduction of “registered partnership” in 2010. Its incomprehensible name indicates that it does not intend to quite afford registered couples the same day-to-day rights as it does civilly married heterosexual couples (there are 72 legal differences).

So, while many actors promote an “equal rights” approach and the equality of men and women is enshrined in the constitution, realizing this in both mundane contexts and structural patterns (e.g., considerable gender pay gap) is often more complicated. This goes both ways, as the image of women as the “weaker sex” also continues institutional positive discrimination, such as no obligation to perform military service or (until 2033) an earlier retirement age. In other words, there are efforts to challenge sex-specific gender norms, but their outcomes might not always be unequivocal.

Education

Empress Mary Therese introduced a six-year general compulsory elementary school in 1774. However, the education of girls was not prioritized until the late 19th century. From 1901, some women were allowed to attend certain courses at university. This was not extensive, and there was continued struggle due to the political climate of the first half of the 20th century. Coeducation was introduced in 1975. Except in primary school, physical education remains sex-segregated.

At present, a minimum of nine years of schooling is obligatory. In age groups over 25, more women than men completed only this minimum. Ninety-nine percent of boys and 98.4 percent of girls were enrolled in primary school from 2008 to 2012. Kindergarten is not obligatory in Austria. The existence, distribution, and quality of accessible (public) child care facilities, such as day care centers, vary significantly depending on location (NationMaster 2017).

The education system has historically been exclusionary. Austria has a “dual” educational system that sends children at age 10 to either the more academic eight-year *Gymnasium* (grammar school) or the more practical four-year *Hauptschule* (high school). As social segregation via and in education has historically worked well within the public system, relatively few students attend private schools in Austria (fewer than 1 in 10), in comparison to other EU or OECD countries. Two-thirds of private schools are run or funded by Roman Catholic institutions. Social democrats’ long-standing efforts for educational reform

have recently borne fruit in the form of a reinstatement of (trial) comprehensive schools in 2008–2009 and the introduction of centralized high school diploma examinations in 2015–2016. The reintroduction of full-day comprehensive schools is an important step, as the design of the entire educational system had previously been built on the premise of children having their mothers welcome them home after a half-day of school (NationMaster 2017).

In the current dual system, there are more girls in grammar schools and more boys in high schools. Women make up 60 percent of secondary school graduates and are a slight majority at the tertiary level. This starts to inverse from the doctoral level onward: 42 percent of PhD graduates and only 16 percent of professors are women. Women are underrepresented in technical schools at all levels. For example, only 21.5 percent of students enrolled in technical courses at tertiary schools and 11.2 percent in the educational field of engineering are women. However, women are heavily overrepresented in the educational and occupational fields of health (86.3%) and service (tourism) work and the social, legal, and economic sciences (NationMaster 2017).

Health

Women’s life expectancy is on average 83 years (5.4 years more than men’s). There are gendered approaches to health and illness as well as gendered patterns of use of health services (UNICEF 2017).

Overall, back pain is the most commonly reported health issue (2006–2007). Women are more affected than men, and even more so regarding osteoporosis, migraines, and depression. Men suffer more from incontinence and commit suicide more often (296 reported cases in women to 997 in men). Women in Austria also suffer from cardiovascular diseases and cancers, such as lung cancer (WHO 2017).

While health is a fundamental aspect and indicator of quality of life for everyone, men and women sometimes need specific services that medicine cannot provide. The Viennese Program for Women’s Health, for example, has promoted the health of women and girls since 1998. The organization has observed that women are treated with medication without hesitation from a young age, particularly concerning the reproductive aspects of their bodies. For example, the contraceptive pill is prescribed to teenagers merely for better skin, and hormone-replacement therapy is readily prescribed during menopause.

This is not to say that reproductive health is not important, but that contraception predominantly lies in the hands,

and happens on the bodies, of women via medical hormones. Condoms make up only 15 percent of contraceptive methods, while hormone-based contraceptives are 60 percent.

In vitro fertilization is legal in Austria. Since 2000, a public fund has subsidized 70 percent of costs of assisted reproduction. However, such assistance is only available to (married) heterosexual couples and is, as a surgical intervention, not always problem free. Invasive surgical interventions in the region of the uterus are indeed still widespread. In 2006, 42,000 curettages of the uterus and 10,800 entire removals of the uterus were performed on women's bodies. More recently, the trend of plastic surgery on the female genitalia, notably a reduction in size of the outer labia, has become a major issue for concern. These operations are performed for aesthetic or rejuvenating reasons, while globally, millions of women are subject to excision as part of female genital mutilation (FGM) Type II.

Breast cancer is the most widespread form of cancer in women. In 2011, 5,349 women were diagnosed with breast cancer, and 1,481 died from it. According to UNICEF, 13,000–25,000 people were HIV-positive in Austria in 2012. The majority of HIV infections were caused from heterosexual contact. Between 1983 and 2005, 2,420 people had AIDS, of which 21.2 percent were women (WHO 2017).

The influence of beauty standards and pressures for women to conform to a particular set of norms is palpable. Already 23 percent of 11- to 15-year-old girls display signs of insufficient or problematic eating patterns (one or no meal on some days of the week). Although women make up 90–97 percent of those suffering from some form of eating disorder, the decisive point is the number of women and girls exhibiting subclinical patterns. This concerns those persons who, based on a negative body image, perform some kind of restrictive exercise and diet regime. Such fears of and measures against being perceived as overweight stand in contrast with an actual and measurable rising rate of people who are overweight. In Austria, however, it is men who are more likely to be overweight (57% of men compared to 19.7% of women). About 6.7 percent of women and 8.2 percent of men have a body mass index over 30, which is considered overweight but not obese (WHO 2017).

Employment

Labor Force Participation and the Gender Pay Gap

Female labor force participation has been steadily rising since 1995, and the EU Lisbon goal of 60 percent has been met since 2001. The rise in women's formal workforce

participation has gone hand in hand with a considerable rise in female part-time work (43.2% in 2010), so-called horizontal segregation, and the establishment of women-dominated jobs. One effect of this development is that Austria has the second-largest gender pay gap after Estonia (Eurostat 2013). In 2015, the gender pay gap was on average 38.4 percent before and 31.2 percent after taxes (Statistics Austria 2017). Lower income becomes a crucial social and individual problem for the financial security of single, female-headed, or migrant households. The pay gap translates into lower pensions, which is often aggravated by years out of the formal job market or part-time work due to pregnancies and other caring responsibilities. This means that the above-mentioned households often live around the poverty line (60% of median income) for long periods and that the women heading them are very likely to face solitary elderly poverty. One measure to address these problems was the introduction of income transparency regulations. Since 2011, companies with more than 1,000 employees and, since 2014, firms with more than 150 employees need to generate a biannual report with sex-specific employment and income details (Eurostat 2013).

In public-sector jobs, the 1993 equal treatment law specifies that explicit efforts to reach a 40 percent threshold should be made in male-dominated areas. When hiring, women with equal qualifications to men ought to be given preference. The success and practice of this regulation is not yet clear.

Household Roles and Responsibilities

Another effect of women's increasing formal labor force participation concerns new questions and debate about the distribution of caring responsibilities. A Statistics Austria study on time use showed that in 2008–2009, 92 percent of women and 74 percent of men did some sort of unpaid housework. While the percentage of men went from around 25 percent in the 1980s to 74 percent in 2008–2009, the amount of time women spent doing housework remained constant—while at the same time their formal employment hours have risen on average. The study found that women on average do 4 hours of housework, while men on average do 2.5 hours of general care work per day (Statistics Austria 2009).

The increase in women's formal employment has had effects in terms of an increased strain for women to reconcile or juggle both expectations and demands at work and at home. Job and family reconciliation has become a

topic of discussion because the double burden often turns into a triple or multiple burden (caring for the home and family members, formal employment, and maintaining social appointments). Due to the high number of people this affects, ensuring life balance has become a major policy issue and a topic for human resource management at businesses. Women's increased participation in formal employment and multiple burdens have also fostered both the ability and need to "buy in" private care services (child and/or elder care, cleaning, gardening, etc.) often performed by vulnerable or migrant women. Certainly, not all families can afford this. This has, however, triggered what some call "care drain" in the care workers' home countries as well as a (transnational) care chain (UNDP 2016a).

Family Life

Teenagers start to go out from a young age and are often in contact with alcohol from age 13. Particularly between the ages of 16 and 19, alcohol consumption on the weekends is considerable. Similarly, numbers regarding daily smoking among adolescents vary between the rather high figures of 20–33 percent. While there is little sex-disaggregated research on this, it is assumed that the behavior of teenage boys and girls does not significantly diverge (OECD 2017a).

The social behavior of teenagers has been a hotly debated topic in Austrian media and policy circles. There has been a tightening of the youth protection laws and their enforcement regarding the sale of wine, beer, and tobacco to adolescents under the age of 16 at shops and bars as well as stricter identity controls for spirits and entry to over-18 bars and clubs. It is, however, not clear whether this has curbed teenagers' weekend alcohol consumption or just shifted it to different, more informal, spaces.

Girls and young women negotiate their family roles in the backdrop of gender-specific socialization. Regarding the treatment of boys and girls, children experience their first years in the context of pink and blue clothes and gender-specific toys. To a certain extent, girls are still expected to set the table and clean the dishes, and boys are expected to know how to change a lightbulb.

The image of the family in terms of the heterosexual nuclear family has continued to be the ideal, even though legal changes are being made. Discussions about what makes a family are ongoing. After the 2010 same-sex-specific registered partnership law, in 2013 the law was changed to allow second-parent adoption; that is, one partner in a homosexual couple may adopt the other partner's

(biological) child. This, however, was only granted after a European Court of Human Rights ruled that previous legislation was discriminatory against nonheterosexuals. The second-parent adoption law also does not allow a homosexual couple to adopt together a child who is not biologically related to either of the partners (OECD 2017a).

In heterosexual couples, the average ages for first marriage are 29 for women and 32 for men. At present, there are around 20,000 divorces per year. The overall divorce rate is nearly 50 percent (OECD 2017a).

For about 10 years, the fertility rate stabilized at 1.4 children per woman. On average, women have their first child at the age of 28.1 (in 1988, it was 24.6). Forty percent of children are born to nonmarried parents (more than 50% for the first child). Even though family law was reformed in 2013, the mother remains legally and solely responsible for a child born outside of wedlock.

In 2014, there were 1.125 million families with children in Austria. Since October 2009, married parents can share parental leave. They are eligible for state child support of up to 14 months (at 80% of their respective current salaries) when the male partner takes at least two months of paternity leave.

Financial support for families is extensive. Some support systems depend on family income levels, the number of children, and age levels. Family support, child care, and "week money" (the social support mothers receive eight weeks before and after delivery) are tax-free. Family money spent on child care until age 10 can be deducted from income tax. For older children, there is income-based public support money for university attendance.

Mechanisms such as the sole earner deduction, which reduces income taxes by USD\$583 per year for one earner in married couples with children living in Austria, show that Austrian laws are family- and child-friendly. They could, however, also be incentives for a (traditional male) breadwinner and (female) housewife distribution of labor.

Women experience and negotiate their sexualities in relation to a range of group-specific gendered expectations, norms, and experiences. In the study "Sexuality and Gender," women interestingly reported to be both more "liberal" in terms of openness toward homosexuality, for example, "traditional" in relation to their understanding of relationships, and self-identified more as feminist than men. Even if this might give a complicated sexual self-image, women report a desire for sexual contact throughout the courses of their lives; this desire only starts to diminish around age 75. Ten percent of women and

12 percent of men report to having had homosexual experiences of varying frequency.

Overall, however, there is indeed insufficient knowledge about women's sexuality that does not focus on their reproductive capacities. Perhaps this comes as no surprise, as female sexuality was described as a passive response to men's desires in the late 20th century. However, about 50 years after feminists invited women to explore and take charge of their bodies and to partake in consciousness-raising groups, sexuality remains somewhat ascribed—today, increasingly via notions of sexuality trending in visual and social media.

Politics

Austrian women gained the right to vote in 1918; men already had before World War I, in 1907. While women were reported to vote more for center-left parties and men for center-right parties up to the 1990s, there have been changes in gendered voting behavior. Probably due to a more general shift to the right, women have voted more right of center since 2008.

After the 2008 general elections, women made up 27 percent of members of the National Assembly. The average of the federal states' parliaments was 24 percent women. In federal chancellor Faymann's second term, 4 out of 14 members of the federal government were women (in September 2014). Also except for Steiermark's Waltraud Klasnic (in office 1996–2005) and Salzburg's Gabi Burgstaller (2004–2013), there were no women governors in Austria's nine federal states. Lower Austria's conservative federal president has been in the governor's seat since 1992. After 25 years of incumbency, his conservative party protégée, former federal Interior Minister Johanna Mikl-Leitner, is since 2017 the first woman governor of Lower Austria, the largest federal state. In other words, until 2017, no woman has held either the post of federal chancellor or federal president.

In the Second Republic, Freda Meissner-Blau was the first woman to run for president in 1986. She received 5.5 percent of the vote in the first round. In 2004, Benita Ferrero-Waldner (conservative party) ran and lost the election by five points. In 2016, Irmgard Griss ran as an independent candidate for president; she obtained nearly 19 percent of the vote. Only 4 percent of Austrian mayors were women in 2008. This represents a more general paucity of female leaders and indicates a strong connotation of leadership with masculinity. Indeed, few women are nominated

as the top candidate in regional, federal, or EU elections, and most influential posts at large public institutions are held by men. In 2008, 6 percent of joint-stock companies had women (or *a woman*) on their managing board.

Recognizing the problematic issues of these numbers, there have been efforts to mainstream gender on the federal level from 2000. More concrete strategies concerning the distribution of public funds were formulated in 2013 in the form of gender budgeting guidelines.

Women's Movements and Feminist Struggles

As in many countries, women have at various points and in various forms fought for self-determination over their lives and bodies, political rights, economic independence, and against constrictive religiously inspired cultural-moral norms. Karoline von Perin founded the Democratic Women's Association Vienna in 1848 in response to the bloody repression of a women workers' demonstration against the lowering of their salaries. In 1893, Auguste Fickert, Marie Lang, and Rosa Mayreder founded the Austrian General Women's Association, which demanded formal political and civil equity and equality of educational and economic opportunities.

In Austria, women have also often expressed their emancipatory ideas in and through the arts, from the Austrian Association of Women in the Fine Arts, which was founded in 1910 to ameliorate conditions and promote women artists' work, to contemporary feminist artists and activists, such as VALIE EXPORT, who attained world fame for her critique of women's position in society.

Another more recent example of a critique of sustained unequal conditions is the demand to change androcentric uses of the German language, from fostering a "gender-just" language by, for example, not solely using the male form of a noun or adjective as the neutral version, to including Austria's daughters as equally "great" children in the national anthem. For before the lyrics were changed, the anthem solely went, "O Austria, you are full of great sons." Demands like these have been the subject of major public and political debate, as many commentators do not agree with making women actively visible in a language (of three grammatical genders) that has a male and female version for every noun (such as lion and lioness in English).

Issues of Integration and Participation

In January 2009, 17 percent of women living in Austria did not have an Austrian passport. Seven out of eight of these

women were from other EU or EEA states, including Switzerland. Based on EU statutes, EU citizens have extensive rights as residents of Austria, including the right to vote in council elections. Residency, access to the labor market, and full participation in different aspects of Austrian society is much more complicated for non-EU and overseas citizens. Naturalization can be started after 10 years in Austria (including 5 years of residency) and results in the loss of the other nationality. Migration profiles as well as an individual's possibility of integration and participation not only vary depending on country of origin but are also gendered. Many individuals and groups remain categorized as "foreigners," even though they might possess citizenship, while others are not, even if they might be temporary migrants. This differentiation might be experienced as unjustified by affected individuals or groups. For example, the average salary of women with a non-Austrian passport is two-thirds of women with citizenship. Their danger of impoverishment is more than twice as high as Austrian women's.

Mainstreaming an inclusive approach toward the participation of people outside and in-between the gender binary, such as transgender people, is also a slow process. Even after Austrian singer Conchita Wurst won the Eurovision song contest in 2014 as a bearded woman, gender identity and gender performance remain uncomfortable subjects. Many trans people face discrimination and social isolation. However, formal recognition of the wishes of trans people has been underway. The 1988 name change law allows the change of a first name "if it does not correspond to the applicant's sex." The status ("in the person"), which is determined in the birth certificate, can also be changed.

Religious and Cultural Roles

The Catholic Church does not provide sex-disaggregated numbers of its members. There is, however, a gendered performance of spirituality. Women participate in, on average, more informal religious acts than men; yet, they are excluded from assuming formal posts and formal participation in the Roman Catholic Church. They cannot become part of the clergy, for example, but they are allowed to do small services such as clean the churches or spiritually accompany children for first communion. There is a palpable tension between the way women, as a group, have historically been excluded and continue to be marginalized in the church, and their strong informal

involvement. Indeed, their active and mundane involvements in the upkeep of the Catholic Church matter due to the prevalence and influence of the church in both the Austrian corporatist state and in society. For example, church taxes are automatically deducted from one's salary as part of a broader "social tax." The church's nonchalance about women's involvement has, in the 2013 words of Pope Francis, often resulted in "a role of servitude." This very much echoes the institution's ambivalence about, and formal rejection of, many women's issues, including sexual health and choices (family planning and use of contraceptives, pre- and extra-marital sex, sexuality in general, expressions of nonheterosexual desires in particular, and divorce).

Insufficient communication, semisuccessful integration policies, and a rise in populist right-wing politics have resulted in a number of reservations and prejudices against non-Christian religions, their members, and alleged practices and values.

Issues

Domestic Violence

In 2011, Austria signed the Istanbul Convention on Preventing and Combating Violence against Women. It was ratified in 2013. Between 2014 and 2016, a National Action Plan for the Protection of Women against Violence was set up to take concrete steps.

Even though the convention has been in place since August 2014, combating all forms of violence against women, specifically in intimate (heterosexual relationship) settings, remains a major social and policy concern. The National Action Plan, for example, reports that the cost of domestic violence amounts to about USD\$69 million (78 million euros) annually in Austria alone. However, there are no official representative numbers about the actual extent of violence against women. The official 2010 Women's Report only notes that one can expect similar figures to Germany—where one in four women (ages 16–85) who ever lived with her partner is reported to have experienced some concrete form of violence (U.S. Department of State 2010).

In Austria, active criminalization of sexual violence against women in the so-called private sphere began in the 1990s. The 1997 protection from violence law gave police the right to remove a threatening or violent person from the shared premises. The antistalking law (2006) sought to take violence out of the private or domestic sphere and

put it on the agenda. Also in 2004, there was a change in terminology in the penal code, including a substitution of “criminal acts against morality” with “criminal acts against sexual integrity and self-determination,” or “prostitution” instead of “commercial sodomy.” Such seemingly small changes can have a significant impact on women’s lived experiences, as the new terminology moved away from a certain understanding of morality that had a negative focus on the woman and the sexual. For example, the substitution of “desecration” with “sexual abuse” in the legal text implies less blame on the victim, while the less shaming term offers more possibility for agentic self-determination.

In practice, however, domestic violence is not straightforward. A major stumbling block in the legal-institutional regulation and fight against domestic, sexual, and gender-based violence is the practice of its enforcement. Although laws and formal efforts to increase protection and support might be in place (e.g., 2008 and 2009 laws), it mainly depends on “the police’s consequent application of the law” (U.S. Department of State 2010), which remains questionable when considering the treatment of women both by law enforcement and the judiciary remains ambivalent. Criminal acts against integrity and self-determination need to be of provable “sexual nature,” which the law specifies as the intensive touch of a primary or secondary sexual organ. Therefore, a forced kiss or slap on the backside does not count. Secondly, the issue of ambivalent treatment became highly visible when, in 2014, a young girl sued her alleged rapist and was instead herself convicted for slander and publicly defamed by the judge.

Moreover, there is also a city-countryside gulf mostly because violent relationships are not (or refused to be) recognized as such by local law enforcement. This is complicated, “particularly in the countryside, women are not seen as victims but as accomplices” (Statistics Austria 2010, 519). Therefore, the Women’s Report asserts, “If men’s violence against women in the private sphere is to be prevented, a profound change in the power relations that create this violence is needed” (Statistics Austria 2010, 505).

The private sphere of the home and the most intimate relations are also the locus and focus of violence perpetrated against the sick and elderly (Hörl 2007). Although demographic change is taking place, the elderly are a neglected social group in two notable ways: financially and socially. Elder financial security is at stake because of a crumbling pension system and elderly poverty. In 2007, women received less than half of their male counterparts’ pensions, a median of only USD\$9,500 (11,000

euros) annually. As the wives of male breadwinners, widower pensions typically average USD\$8,900 (10,164 euros) annually before tax. This brings up lots of questions about how care for a growing number of single elderly people and an increasingly aging population.

Although the perpetration and the discussion of violence against women are mostly made invisible as non-topics, violence against disabled women is an even bigger taboo. Already marginalized, individual disabled women’s experiences with violence—in most cases sexual—are often simply not dealt with and as such do not really exist. In Zemp’s research, it was found that more than 60 percent of the research participants were sterilized, 62 percent had experienced sexual harassment, and 64 percent had experienced sexual violence (Zemp 2002). In most cases, there are no tangible consequences for the perpetrator(s). In a case of continuous sexual abuse of an underage mentally disabled girl by close family as well as other people known to her, state agents only showed signs of involvement when the considerable abuse resulted in a pregnancy.

Violence against women in the private sphere is particularly traumatic for women due to the proximity to the perpetrator and locus of violence. Often children or other dependents are indirectly involved or affected. Moreover, the effects of abuse are not of purely physical nature, and much violence takes a plurality of forms—notably, emotional and mental violence, such as prolonged threats or involvement in dependency. Women often find it difficult to leave such relationships of dependency, even though they might suffer significant psychological damage and deterioration in health and quality of life.

There is little formal information about what is sometimes called “tradition violence” (U.S. Department of State 2010, 531). This includes the perpetration of violence against women in the form of female genital mutilation (FGM), so-called honor killings, and forced marriage.

Based on campaigns against such forms of violence, there have been efforts to raise consciousness and formulate appropriate laws. Since 2006, forced marriage has been criminalized as severe coercion. It is estimated that around 8,000 victims of FGM live in Austria. Legally, FGM is a criminal assault, even if performed abroad. Since 2006, the limitation expires when the woman comes of age. This is, however, very difficult to enforce. There are stereotypes about the origin and justification of crimes in the name of “honor” that are quick to blame culture and religion. The Austrian Islamic Association, for example, stresses that forced marriage, honor killings, and FGM are not

condoned Muslim practices and do not have a foundation in the Koran.

Rape is criminalized under the Austrian Penal Code with a penalty from 6 months to 10 years. This is increased to 5 to 15 years if the forcible intercourse or the forcible sexual act, comparable to intercourse, was reached by particularly severe means or had particularly severe consequences. Marital rape was first criminalized in 1989; since 2004, it has been a criminal offense, which the wife does not need to explicitly claim.

However, rape survivors often struggle with the reality of these legal statutes. While the inhibition to press charges is high, women are often not taken seriously by the police. In 2013, there were 920 reports of marital rape, but only 104 convictions. Such numbers reinforce an already strong fear of not being taken seriously and the consequent tendency not to press charges. The result is a relative high impunity for committing rape. There are now campaigns to amend the legal text so that the explicit physical force, deprivation of liberty, and threat no longer constitute both the actual rape and function as the provable prerequisites for a conviction. The “A No Must Be Enough” campaign argues that the person’s will and expression should be enough to determine what counts as a forcible act.

Violence: The “Public” Sphere

Sexual harassment and assault are forms of violence against women that primarily happen in the “public” sphere. The 1979 equal treatment law made first legal provisions. The 2002 EU directive on the implementation of the principle of equal treatment for men and women in regard to access to employment, vocational training and promotion, and working conditions (2002/73/EC) states, “Sexual harassment: where any form of unwanted verbal, non-verbal or physical conduct of a sexual nature occurs, with the purpose or effect of violating the dignity of a person, in particular when creating an intimidating, hostile, degrading, humiliating or offensive environment.” According to applicable Austrian law, cases of sexual harassment can be reported in a period of three years (if the harassment happened after August 1, 2013). However, the law conceptualizes sexual harassment only in the context of the workplace. Public spaces (including when accessing services) are excluded. This is far removed from women’s experiences and understandings of sexual harassment, as the 2012 case of a woman cyclist having her bottom grabbed while waiting at a red light illustrated. Her

charges of sexual harassment were dismissed based on the lack of “intensive touching of a primary or secondary sexual organ” in a public space.

The sale of sexual services (prostitution) by adults is not illegal in Austria. However, the act of profiting from the sale of sexual services of *others* is illegal (the law against “procurement of women,” Section 216 of the Penal Code). Decriminalization of the act and the person offering those services started in the 1970s. The goal was to reduce the risk of exploitation due to unregulated, unsafe conditions. Criminalizing the voluntary selling of sexual services would neither have the effect of the disappearance of prostitution nor guarantee somewhat acceptable working conditions for sex workers. The 1975 penal code reform, however, strictly regulated prostitution. In 1983, sex workers became subject to paying taxes and, in 1998, received access to general social insurance. Measures regarding health care and prevention of infections or violence are also important. Legally, sex workers are self-employed. It is estimated that 90–95 percent of registered sex workers are migrants. At the end of 2007, 5,150 sex workers and 710 brothels were registered in Austria. A majority of registered sex workers live in cities. It is estimated that while 1,506 sex workers were registered in Vienna in 2007, around 3,000 were not registered.
